

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

## Wire Grip Non-Skid Tires (Midgley Tread)

**The Tire That Has  
Solved The Problem Tire  
Makers Have Been Working  
On For Years.**

The Hartford Wire Grip Non-Skid Tire is the only true non-skid that is resilient;

The only true non-skid that does not rack and ruin the car;

The only true non-skid that does not mar the easy riding qualities of the car;

The only non-skid that you carry right with you in the tread of the tire itself;

In other words, it is a pneumatic tire and a non-skid tire combined;

Insure your car, its passengers and the public by putting them on your car now.

This tire is made in standard sizes, Clincher and Dunlop, and Hartford Quick Detachable Clincher; also in millimeter sizes.

Regal Car on 4,031½ Mile Journey

## Remy Magneto Under Water for Hours

Required no adjustment. Batteries not needed. Success of this record trip from Coast to Coast largely attributed to perfect results of Remy Magneto.

REMY ELECTRIC COMPANY, Anderson, Indiana.

Gentlemen:—Referring to the trip made with the Regal "Plugger" from New York to San Francisco in which we lowered the touring car record from Coast to Coast. I wish to say that your magneto proved satisfactory in every way; no adjustments of any description were made and no attention paid to it whatever, and yet it never failed to give results.

We used no batteries on the entire trip, starting entirely on the magneto, and although at times the entire engine was submerged in water for hours, we noticed no effect whatever on the magneto, or the result given from the same. We attribute a great deal of our success on this trip to the fact that we had no trouble whatever with your magneto.

Wishing you every success, and trusting that should I again make such a journey I may have a car as good as the Regal "Plugger," and that it will be equipped with a Remy Magneto, I am

Very respectfully yours, (Signed) WILLIAM H. SMITH.

Cobe Trophy Won by the Aid of the Remy Magneto

# Over 100,000 Remy Magnetos Sold for 1910

Not a quantity user who helped make our immense 1909 season but that has adopted the Remy for 1910, besides many manufacturers have adopted the Remy for 1910 who formerly used other magnetos. Our factory is the largest and best equipped plant in the world devoted exclusively to magneto manufacturing. Dept. 11.

Licensed under Selden patent.

# How can you expect comfort in an automobile that is rigid in construction?

The first thing to be sure of when you select an automobile is comfort.

Look to the springs. If you do not know what is what in springs go to a good carriage man. Study the proposition yourself. You will find that semi-elliptic or other form of springs cannot possibly equal full-elliptic springs. Automobile manufacturers using them do not claim that they do. They use them because their plan of construction will not permit full-elliptic springs.

The Franklin, like the finest carriage, is flexible and easy. It has four full-elliptic springs and a wood chassis frame, the only means by which full comfort can be secured.

**After comfort the first best investment in an automobile is reliable tire equipment.**

There is no tire problem with the Franklin. You have no tire worry; you do not have to carry extra tires.

We make the tire question a straight engineering proposition. We are not afraid, because of cost or any other reason, to do it right. We put tires on that are large enough and strong enough, with margin to spare, to do the work. Such tire equipment costs us more, but the ultimate cost, the cost of using, is less to the purchaser.

Compare the sizes of tires on 1910 Franklins with the sizes of tires on other 1910 automobiles.

Reliable tire equipment pays a big dividend every day in the year. The ordinary tire equipment draws on your capital all the time. It may give you value received in rubber at so much per pound, but not in service. Figure it out yourself. Four-inch tires on a 2000-pound automobile are worth twice as much and last twice as long as the same four-inch tires on a 3000-pound automobile. The reason is that every five per cent increase in weight in an automobile adds fifteen per cent to the wear and tear on the tires. Therefore, the average water-cooled automobile with its rigid construction and extra weight due to water-cool-

ing apparatus, weighing as it does a third more than the Franklin, wears out tires just twice as fast.

**Is water cooling crude and out of date?**

Comfort comes first, but with the scientific construction necessary for easy riding you want scientific motive power—something simple and which is reliable all the time.

The Franklin air-cooled engine is without a rival. Its cooling system is as perfect as it is simple. In comparison water cooling is crude and out of date. No one has ever been satisfied with it. It has been used for want of something better. But you may not be convinced; in that case examine a Franklin engine and a water-cooled engine side by side, and then put both to work on the road, on bad hills or in deep mud. You cannot overheat the Franklin; you can overheat the other.

Franklin air cooling has none of the mechanical working parts of the water system, none of its complication, weight, freezing troubles and liability to get out of order. Franklin air cooling simplifies and lightens the whole automobile. It performs its functions under all conditions. Each cylinder is completely enveloped in a column of rapidly moving air. Fresh air passes over every part of each cylinder, cooling the engine better than is possible with any water-cooling contrivance.

The Franklin new cooling system is the biggest automobile invention of the time.

Franklins are made in three chassis sizes, four- and six-cylinder, with twelve different body styles. The Franklin six-cylinder automobile, Model H, is the lightest-weight high-powered automobile made. The main advantage of a six-cylinder engine is to obtain an increase in power beyond the increase in weight. In Model H the increase in power is thirty per cent greater than the increase in weight. It is the only six-cylinder automobile which obtains the full advantage of the six-cylinder design.

Regardless of what automobile you own or favor, our special edition catalogue de luxe, probably the handsomest automobile book ever made, will interest you. It is sent only on request. Write for it.

# Dealers! Our 1910 Prices Are Business Getters

Prepare yourself now for Spring Trade. Predictions are that we will have the greatest business year in the history of the Automobile. Now is the time to decide what goods you intend carrying and to acquaint yourself with the reductions in prices. Don't wait.

If you are unaware of the sweeping changes that have taken place and the new goods that are on the market, we would suggest that you send for a copy of our new catalogue and discount sheet. Our prices this year are lower than ever, and we are exclusively wholesale, our business being with the trade only.

## "ARGOS MIRRORS" Prevent Accidents

Enables you to "See What's Coming." With it you cannot have any smash-ups. Clamped on the wind shield or limousine of the car, the road behind is distinctly seen. Auto traveling is dangerous unless you can see what is behind you.

Argos Mirror, less hood..... \$6.00  
Argos Mirror, with hood..... 7.00

Can be furnished in brass, nickel or gun-metal finish at the same price.

## The "GRAB" Pump Connection

The quickest, simplest and tightest pump connection on the market. Fits any valve instantly. Simply clamps on and off. Leakage impossible. Nothing to wear out or get out of order.

Price .....25 cents

## The "IMPROVED" Valve Tap and Die

The only one-piece tire valve repairer on the market. Will remove the most refractory valve inside in a minute, besides re-threading outside and inside of valve. Made of drop-forged tempered steel. Positively the handiest little tool manufactured.

Price .....25 cents

## The Famous English Spark Plug "POGNON"

They have been adopted by all leading motorists and manufacturers abroad, by the British, French and Italian Navies, and for Aero-station, aviation, etc., in the principal countries of the world.

In metric sizes only, each..... \$2.00

## The Bugle Call Auto Horn "LE TESTOPHONE"

The most popular European horn novelty ever produced. Its sound resembles a military bugle horn, eliciting attention wherever it is heard. It operates like a bulb horn except that each time the bulb is pressed a piston moves out, rotating a ratchet which directs the air to the various tubes in turn. Finished in brass only. Length 26 inches.

Price .....\$25.00

## The "YORK" Motor Clock

A new product in design and movement. Has no projections or obstructions to be broken off or prevent thorough polishing. Is absolutely thief, water and dust proof. Runs 8 days. Size 4 1/2 inches.

Price, each ..... \$7.50

## C. K. AMMETERS and VOLTMETERS

Hand Calibrated, accurate instruments. The magnets are forged from the highest grade of imported magnet steel.

Voltmeters—8 volts ..... \$2.00

Ammeters—9-30 amps ..... \$2.00

Volt-Ammeters—0.8 volts, 30 amp. 2.75

## The "SAVOY" Motor Clock

The best value obtainable. Highly polished brass case. French porcelain dial 3 3/4 in. in diameter. Clear figures, easily read, second hand. Will run 8 days on one winding. Size, 3 3/4 x 4 1/4 inches.

Price .....\$10.00

# Everyman's Car

## \$485

F. O. B. FACTORY  
Rumble seat and tool box  
\$20.00 extra

## The Brush is not an imitation nor an adaptation of any other automobile

It is not a big, complicated car cut down in size to sell at a low price, but is a simple, staunch, reliable runabout—the only motor car built in this country that can properly be called by that name.

It is designed to do the strenuous work demanded of a runabout and its design is such that we can build it as well as any of the large cars are built and still sell at this wonderful price.

Before the first Brush was built, we foresaw the demand for a

reliable automobile which would replace the "horse and buggy," just as the big touring car and limousine have replaced the team, the carriage and the coachman.

The enormous demand for the Brush shows that our judgment was correct—and it is not a demand from any one territory, nor from any particular class, but from sane, thinking people in all parts of the world.

## Everybody Buys the BRUSH

**THE BUSINESS MAN**, who judges it from the standpoint of utility and minimum depreciation.

**THE PHYSICIAN**, who must have absolute dependability and exacting service.

**THE CITY AND COUNTRY SALESMAN**, considering initial cost as well as maintenance expense.

**THE FARMER**, who looks at the Brush as an investment, not a luxury.

**THE SUBURBANITE**, who is at the mercy of inconvenient transportation facilities.

**THE YOUNG FOLKS**, who want a good looking little car and must have simplicity without excessive speed.

Even the manufacturers of some of the larger automobiles are using the Brush in their business. Could we offer you better evidence of the value of Brush cars than the fact that the Chalmers-Detroit Motor Company is using SIX of them? More than a year ago, these people bought one car, which showed such wonderful results that they have since purchased five more.

The six models we are building, in addition to the standard runabout shown above, will meet the requirements of all. The Brush knows no class—recognizes no competition. It is really "Everyman's Car."

Write for preliminary announcement.

**BRUSH RUNABOUT COMPANY** 1014 Baltimore Avenue  
Detroit, Michigan

The  
**Hudson**

**Touring  
Car**

**\$1150**

"Look for the Triangle on the Radiator"

This price includes three oil lamps, two gas lamps, generator, horn, tire repair outfit, tools and jack.

**Strength—Room**

**Beauty—Refinement**

Think what this car is—110 inch wheel base; four cylinder motor; 32 inch wheels; 3½ inch tires all around; five passenger capacity—and the price \$1150.

Never before has there been offered such a car at such a price. This is not just a hasty statement of our own. Can you think, yourself, of any other four-cylinder, 110 inch wheel base, five passenger car at \$1150 or less?

You will find these features in other cars, but those cars sell for at least \$100 or \$200 more. You will find still other cars selling for less than \$1150, but they do not have our high-grade features. The Hudson Touring Car is the best *value*, the best *buy* yet offered by

any automobile manufacturer. By this, we mean you get relatively more *for your money* than in any other car.

There are certain proved features of motor car construction which any car must have before it can be considered an up-to-date, high-grade car.

The Hudson has those features. To those makers who show you the same features, we point to our price; it is lower than their's. To those who offer cars below \$1150, we point to our high-grade features; they do not have them.

From one class we are set off by our price; from another by our quality.

**Hudson**

**Roadster**

January 1st, the price of the Hudson Roadster was increased to \$1000. This includes 32x3½ tires Front and Rear; three oil lamps; two gas lamps; generator; tire repair kit; tools and jack.

The Hudson Roadster is America's biggest, best looking and best built low-priced car. Several thousand of them are in the hands of owners and giving complete satisfaction.

The Hudson won a 24-hour race in Seattle in September, defeating many high-priced cars. This was its first race.

Mr. E. H. Nelson, a prominent business man of Detroit, drove his Hudson car from Detroit to New Haven, Conn., at an expense of less than one cent per mile for oil and gasoline and without making a repair.

Mr. Geo. D. Smith drove a Hudson Roadster from Long Island, N. Y. to Pleasant City, Fla., without touching a bolt, nut, spark plug or making a mechanical adjustment.

Remember the Hudson Roadster is not an imitation of a big car—it is a big car. It is big in design, in material, in general all-around value. Look at our price on extra equipment. Bosch magneto, Ardentop, Prest-o-lite tank and rumble seat for \$150 extra.

### High-Grade Hudson Features

Its motor is the Renault Type, patterned after the famous Renault motors of France. It is the same type of motor as used in the Hudson Roadster; four cylinders "en bloc;" vertical, water-cooled, long stroke, 20 to 25 H.P. Due to its long stroke this motor pulls quietly and evenly at low engine speeds.

Transmission is selective, sliding gear; three speeds forward and one reverse—the same transmission as found on the highest priced cars.

The spring suspension is the same as used on cars costing up to \$6000. Semi-elliptic front and ¼ elliptic rear, unusually long, mounted with heavy, strong fittings. Clutch is leather faced cone type; rear axle semi-floating, shaft driven. Front axle "I" beam section, drop forged, of carefully selected, high-grade steel.

### Hudson Refinements

When we say the Hudson has refinement, we mean that many little things, of small importance, one by one, but meaning in their total, comfort and satisfaction to the owner, have been put into this car.

See how the rear fenders are inset against the body; how the fenders throughout are absolutely mud-proof. Inset fenders are a feature of very high-priced cars.

The unusual leg room and big 18 inch steering wheel mean *comfort*. No standard touring car at any price provides as much leg room as the Hudson.

Doors are big, hung on heavy curved hinges, allowing maximum entrance and exit space.

The Toe boards, spring steps and running boards are beautiful aluminum castings. The floor board is covered with pyramided white rubber of best quality, except where driver's heels rest and this part is reinforced by an aluminum plate.

The foot accelerator is something entirely new in design and does not tire the foot.

The body is built with wheel-housing, that is, the body curves out over the rear wheels, allowing a big, comfortable, roomy tonneau. Car is finished and upholstered like the best.

### Why You Get More Value in a Hudson

We have been asked how we can give so much for the money and our answer is: "Because we know how." Two engineers could undertake each to build a railroad from New York to Chicago—roads to be of equal length; one man would build a better road for the same money than the other, or the same road for less money than the other. It is so in the automobile business; one set of men will build a better car at less money than another. It is simply a question of ability.

See this car—ride in it—compare it with other cars and you will say that no matter just how we do it, the fact remains that we do give the most at the price.

This also holds true of Special Equipment. Think of a Bosch Magneto, Special Brookfield Top, and Trunk Rack, all fitted on the car for \$125 extra.

The Hudson will exhibit at the Madison Square Garden and Chicago Shows

# THE MARMON

"The Easiest Riding Car  
in the World."

*Winning the Wheatley Trophy in the Vanderbilt. 190 miles in 190 minutes, without a stop.*

## Mile-a-minute Reliability

The success of the Marmon "Thirty-two" stock cars in the big race events of the year is still the talk of motordom. In the Vanderbilt, won the Wheatley Hills Trophy—190 miles in 190 minutes—**without a stop**. Won the Atlanta Speedway Trophy, 120 miles in 109 minutes, **without a stop and without a mechanician**. At New Orleans, won the 20, 50 and 100-mile events at practically a mile a minute on a one mile track—**all without a stop**.

In the Indianapolis Speedway races, made mile-a-minute runs of 100 and 225 miles, **without a stop**.

**No other car has ever shown such stability under the merciless strain of long continued high speed.**

The Marmon is manufactured (not merely assembled) by a company known to buyers of high-grade machinery, the world over, for more than fifty years.

It is pre-eminently the safe choice for the buyer who seeks absolute certainty of service, style, comfort and value.

One chassis only—the "Thirty-two." 32-40 H. P. Option of body. Weight 2300 lbs. Complete, high-class equipment.

THE MOTOR WORLD

Palmer-Singer Six-Sixty, 6 cylinders,  
60 H. P., Sixty-five miles an hour

**\$3500**

TOP EXTRA

**The 1910 models of the Palmer-Singer line are two years in advance of the new models of other and higher-priced makes and here are the REASONS WHY:**

**Features of Construction Common to all Palmer-Singer Models**

The best features of the best 1910 cars were found in the 1908 Palmer-Singer models. The five best other makes have between them for 1910 ALL the features which were leading constructional Palmer-Singer points two years ago—but **no one make** has them all. Still each make very properly exploits these features as the utmost yet achieved in motor-car construction and value. Bear in mind that while adopted for the first time in their 1910 models by other makes, these features have been for two years integral points of Palmer-Singer construction, and have been thoroughly tested out for two years in the hands of private owners—have stood exactly the use you would give them. They have been adopted and refined for two years, brought to the point of perfection not only in themselves, but with relation to every other part of the car. To-day the harmonious whole is, in **design** and value, two years ahead of the other leading makes who are adopting these features or a part of them for the first time.

# The 1911 IMPROVEMENT for 1910

One year ahead of all other devices for quick and easy tire-changing on the road.

## "Firestone" Demountable Rims

CARRYING EXTRA INFLATED TIRES

QUICK DETACHABLE OR REGULAR CLINCHER

EASIEST TO OPERATE ON THE ROAD—SAFEST OF ALL TO USE.

Unlock the rim with damaged tire and substitute a spare rim with already inflated tire. No loss of time; no annoying exertion; no tire pumping.

Firestone demountables are quick detachable, and completely abolish the lug and staybolt nuisance of other rims.

The only demountable that is practical in changing tires on the loose rim.

Make one or a dozen tire-changes on the same trip,

as necessity may require — exclusively Firestone.

Not a show-room proposition, but the rim you want for actual road service.

Specify with Firestone tires on your new car; retain present tires in use upon equipping your present car.

Ask for a personal demonstration and copy of Demountable Rim Book.

## FIRESTONE TIRE & RUBBER COMPANY

"America's largest  
exclusive tire makers."

Akron, Ohio

Branches, agencies  
and dealers everywhere.

### Firestone Non-Skid Tires

The all-rubber tread presents a mass of angles, edges, hollows and points of road-contact that holds your car safe from skid-accident, as no other tire can.

Limousine (\$2750)

## We Have Been Two Years

**In two seasons of motor contests Chalmers-Detroit stock cars records give Chalmers-Detroits title of Champion**

You do not want a racing car. Neither do we. We have never built one. We have not gone into races merely for the fun of it. It is simply a cold dollars and cents business proposition. We have gone into contests because we believed that was the best way to prove our cars.

We spent last year a good many thousands of dollars in automobile contests. One-third of this amount we charged to advertising expense. Two-thirds we charged to Engineering expense—because this is the best experimental work we know.

We are determined to build the best cars in the world at the price, and so long as we think contests help us do that, we shall remain in contest work.

We have never claimed to make the best cars in the world—but the best cars in the world at the price.

True there are many people who believe Chalmers-Detroit cars the best cars made regardless of price—those people are owners of Chalmers-Detroit cars.

### **FOLLOWING IS SOME EVIDENCE:**

#### **Not a Few Contests, but Many**

In two years Chalmers-Detroit cars in prominent automobile contests have won 89 firsts, 32 seconds, and 21 thirds.

This includes road races, track races, hill climbs and endurance contests.

#### **Our "30" Sets World's Record**

In the past two years there have been in America six—and only six—great road races for light cars. Chalmers-Detroit "30's" have been entered in all six and they have won five firsts, one second and one third. In no race did they fail to show. Here is the full story:

First and second in Jericho Sweepstakes, Long Island Motor Parkway, October, 1908.

Third in the 200 mile International Light Car Race at Savannah, November, 1908.

First in the Indiana Trophy race, June, 1909, when Matson averaged 51.5 miles per hour for 232 miles, making better time than the winner of the Big Car race of the following day.

First in the Santa Monica (California) 202 mile race, July, 1909, where it set a world's speed record for light cars of 55.5 miles per hour.

First in National Light Stock car event at Lowell, Mass., September, 1909. Driven by William Knipper 127 miles at an average speed of 52 miles an hour.

As a climax this greatest of light cars, driven by Matson in the last Vanderbilt race, again set a new world's light car speed record by averaging 58.5 miles an hour, winning the Massapequa Cup. Not once during the race did this car stop, and it defeated the nearest competitor by nineteen minutes.

#### **100% of Victories**

The record of the "30" at the opening of the new Atlanta two-mile motor track last November has never been equaled.

Two "30's", driven by Knipper and Matson, won every event offered in their class. Whenever both cars were entered in an event, second place was taken as well as first.

Both cars finished every event started.

Both cars averaged a mile a minute for every minute they were running on the track.

For the week the Chalmers-Detroit tally stood five firsts, eleven seconds, and eight thirds—the best average showing made. Yet many of the finest cars—foreign and American—were there.

#### **Winner in Glidden Tour**

The record of the "Forty" also is wonderful.

"The "Forty" won the Detroit Trophy in

# **Chalmers-Detroit Motor Co.,**

Licensed under Selden patent.

Touring Car  
Pony Tonneau  
Roadster

Chalmers-Detroit "Forty" \$2750

## Writing This Advertisement

have won 89 firsts, 32 seconds and 21 thirds—*Motor Age* cars of the year—Racing not fun but business with us.

the Glidden Tour this year, the longest and hardest automobile touring contest ever held.

It has won twice in succession the Minneapolis Tribune Trophy in the two-day endurance test.

It won the Perpetual Challenge Trophy in the Pasadena-Altadena Hill Climb, the most coveted trophy in California.

Driven by Dingley, it won the Wemme Trophy at the Annual Rose Festival Road Race at Portland, Oregon, doing 103 miles in 104 minutes.

It won in its class at the Sport Hill Climb, and set a new record for the course. At the Dead Horse Hill Climb, Worcester, Mass., the "Forty" won two firsts, one second, and two thirds.

At the Readville, Mass., track, a "Forty" won the ten mile event, and in the race for the Harvard Trophy at 25 miles, covered the distance in 24 minutes, 45 seconds, forcing a specially constructed foreign track racer to establish a new world's record for this distance in order to win.

### Defeats Fifteen Bigger Cars

Driven by Lorimer, the "Forty" won the 100-mile and the 10-mile events in the Point Breeze Races at Philadelphia, also the 100-mile Motor Marathon at the Brighton Beach Track, New York City.

In the 200-mile road race over the Fairmount Park course in Philadelphia, the "Forty" defeated one 90 h. p. car, four 70 h. p. cars, seven 60 h. p. cars and three 50 h. p. cars. It was beaten by only one car—a 90 h. p. giant, more than twice as big and twice the price, and then only by four minutes.

The "Forty" was awarded the "Consistency Prize" because it did not stop a single time during the race.

Bert Dingley has driven a "Forty" all the past season. Of the many road races he started he failed to finish in but one. On this showing *Motor Age* awards him the title of premier American driver of the year.

### How Private Owner Profits

But the prospective owner may ask: what does all of this mean to me?

It means simply that the Chalmers-Detroit Motor Company has proved, for your benefit, that its cars are everything they claim they are—the best cars in the world at the price.

Every car the Chalmers-Detroit Company has entered in an automobile contest has been strictly a stock car. We have never built a racing car.

### Looking to Improve

If there is anything wrong with our cars we want to be the first to find it out. This is another reason we go into contests.

A 200-mile road race at sustained speed of 40 to 80 miles an hour puts a car to a severer test than the average owner could put it to in a whole year's use.

If there is a weak spot in a car it will be discovered under the strain of contests, and the improvement can be made. They show you where improvement can be made.

Therefore—the private owner is the one who gains most from our automobile racing.

We shall be pleased to send you our handsome new catalog, showing our various models reproduced in actual colors, if you will mail the coupon.

A Memo. to

Chalmers-Detroit Motor Co., Detroit, Mich.

Please send me copy of "Flag to Flag" book giving the story of the Denver-Mexico City trip; also send your catalog.

# FIT FOR SERVICE THE YEAR 'ROUND THE SAME AS YOUR \$5000 CAR—THE

## *Hupmobile*

4 Cylinders  
20 H. P.  
Bosch Magneto  
Sliding Gears

# \$750

(F. O. B. Detroit)

**BECAUSE** they found in the Hupmobile the first and only car of its type built with the same unswerving honesty of purpose as the finest large cars extant—the American people have accorded it a place in their esteem shared only by the acknowledged leaders in the costlier class. Like the latter, its position is secure, undisturbed and beyond question. Like the latter, it knows no season of usefulness; it is at your service all through the year. Bear in mind the price—then study these specifications:

### SPECIFICATIONS

**ENGINE**—4 cyl., 20 H. P.,  $3\frac{1}{4}$  in. bore,  $3\frac{3}{8}$  in. stroke; L-head type; water cooled; offset crankshaft; fan bladed flywheel in front; Parsons white bronze bearings; noiseless camshaft.

**TRANSMISSION**—Selective sliding gears in extension bolted to crank case; shifting without noise.

**CLUTCH**—Multiple disc type; self adjusting; enclosed in gear case; running in oil.

**REAR AXLE**—Shaft drive; Hyatt roller and New Departure bearings; shaft and universal joint enclosed and lubricated by oil from crank case through transmission.

**TIRES**—30x3 inches.

**BRAKES**—Two foot and two emergency (internal expanding) lined with Thermoid, on rear hubs.

**IGNITION**—Bosch high tension magneto, doing away with spark coil, batteries and connecting wires.

**WHEEL BASE**—86 inches.

**TREAD**—56 inches.

**SPRINGS**—Semi-elliptical front, patented cross spring rear.

**EQUIPMENT**—Two side and tail oil lamps, dragon horn, tools, repair kit, pump.

**WEIGHT**—1100 pounds, regular equipment.

## HUPP MOTOR CAR COMPANY, Dept K, Detroit, Mich.

Exhibiting at Grand Central Palace, New York—Opens Dec. 31

**1910 TOY TONNEAU**

**Touring Car, Toy Tonneau and Runabout, \$2750.** Including full equipment. The 120" wheel-base, three-quarter elliptic rear springs, drop frame, and rear seats ahead of the rear axle give perfect riding qualities, and combined with the well known thirty horsepower Corbin motor makes the ideal car.

**TRANSMISSION**

Transmission exposed in fifteen seconds through large hand hole plate. All shafts and gears mounted on ball bearings and running in grease. Gears, shafts, etc., constructed from special nickel steel. Brake automatically acts on clutch doing away with any clashing of gears.

**STEERING GEAR**

The steering gear is of the worm and sector type of ideal design. Instead of having a sector, a full gear is used in connection with a square taper in the drop arm. In case of wear to one quarter of the gear such as a sector would be, the drop arm can be removed, the gear and shaft revolved to another quarter, and the steering gear is as good as new.

# Ride On Air

This headline must be observed if you are going to get maximum service from your tires.

Extensive service tests and long experience have so convinced us of the desirability of pumping tires up hard that we are going to devote some space to telling you about tire construction.

As to our construction, we know and you all know, who know Diamond equipment at all, that it is right. As to what constitutes sufficient inflation, there exists so much of unintentional neglect, lack of knowledge and downright indifference, that we can be of no greater service at the beginning of this new year than to say to you all, tires must be pumped up hard if they are to give maximum service.

This is particularly true of the overloaded tire, and four-fifths of all tires are frequently overloaded.

Ample inflation checks the movement within the tire and reduces the element of friction and heating. You will ride, in fact, on a cushion of air and not a cushion of rubber. Every comparative record shows the greatly increased tire service obtained when ample inflation is provided.

# -Not Rubber

As recognized leaders in the march of progress of motor production, we are duty bound to tell you that with Diamond or with any other pneumatic tires you will not get the most for your money if you fail to keep tires pumped up till they stand round under a full load. This is the only safe rule.

For 1910, Diamond casings and Diamond tubes are distinctly better than we have ever heretofore made, but our uttermost efforts in this direction count for vastly less than they should if the user fails to do his part.

We have, in other words, produced casings and tubes capable of delivering greater value and better tire service than you have hitherto considered possible. It rests absolutely on the user to provide air.

He must give his co-operation, and his reward will be in the reduced upkeep cost that must ultimately be of great benefit to the automobile industry as a whole.

SPECIAL DISCOUNTS TO DEALERS

**JAMES L. GIBNEY & BRO., Philadelphia, Pa.**

**Mitchell**

SILENT AS THE FOOT OF TIME

THE LOW-COST HIGH-CLASS CAR

# THE MITCHELL LINE

The remarkable construction of these cars—the simplicity of motor, strength of frame, beauty of design and finish, utterly noiseless engine, standardization of parts and attention to those things which are dear to the public heart as well as the fact that although sold at low cost, they are made of the very finest materials the world affords, have all served to create enthusiasm of extraordinary character. Hence the demand is far greater than the supply. The output for 1910—6,000 cars—was sold months ago and since then we have had orders for so many more that if we could produce ten thousand we could sell them by wire in 48 hours.

The entire line will be exhibited at the New York Show beginning at the Grand Central Palace, December 31st—Section 6, Space 22, Main Floor.

Licensed under Selden patent.

# Judge This Car by the Specifications—Not the Price

Henry Model L

## The HENRY 35—\$1750

A car that makes its appeal to the rapidly growing class of buyers whose first consideration is standard construction, and whose second thought is as low a price as is consistent with such construction.

The automobile buying public has come to know the features that make for a car of genuine merit.

To those qualified to judge we submit the speci-

fications below with full confidence that the Henry 35 at \$1750 will be recognized as the biggest value of the season.

Both dealers and purchasers have had their fill of "freak" and "little-while" cars. Things have settled down to cars of merit.

The Henry 35 is made to sell on its merits at \$1750.

### Detailed Specifications

**BODY**—Straight line, standard touring and demi-tonneau. Seating capacity, five. Color: Dark blue throughout, or with cream running gear, if preferred.

**MOTOR**—Four cylinders. H. P., 35-40. Bore, 4 $\frac{1}{4}$ , stroke, 5 $\frac{1}{4}$ . Cylinder, "L" head. Cast in pairs. Valve location, all on one side. Cycle, four.

**LUBRICATION**—System, circulating inside pump. Vertical shaft, spiral driven. Pressure feed to crank case.

**COOLING**—Water cooled, centrifugal pump. Radiator, square tube. Fan, attached to engine, belt driven.

**IGNITION**—Jump spark. System, dual. Splitdorf magneto and dry cells. Control, hand lever on wheel.

**CARBURATION**—Carburetor, special. Fuel feed, gravity.

**CLUTCH**—Multiple disc. Friction surfaces, steel to steel. 63 plate.

**GEARSET**—Selective, located amidship. Three speeds forward and reverse.

**TRANSMISSION SYSTEM**—Shaft drive through torsion tube. Rear axle, full floating.

**BEARINGS**—Crank shaft, three large plain. Camshaft, three plain. Clutch, spindle, plain. Clutch,

thrust, ball. Gearset, F. & S. ball. Rear Axle, ball, Front Wheels, ball. Steering Knuckle, plain. Steering Gear, ball thrust. Plain Bearings, Parsons white brass.

**RUNNING GEAR, ETC.**—Wheel base, 116". Tread 56. Wheels, 10 spokes front, 12 rear. Tires, front and rear, 34x4 Q. D. rims. Springs, semi-elliptical. Rear Springs (extra long, 49 in.), three-quarter scroll. Front Axle, pressed steel box type. Brakes, service and emergency, internal on rear wheel. Frame, pressed steel; double drop. Steering gear, irreversible worm, sector type; wheel 17 in. Equipment, generator and full lamp equipment, horn, tools, jack, etc. Weight, 2,450.

Twenty-five dealers wanted who are in a position to take a generous amount of territory.

E. R. Thomas Motor Co.,  
Buffalo, N. Y.

12/4/09

Gentlemen:—

It gives me great pleasure to speak in highest words of commendation of my Thomas car.

I have driven it over 20,000 miles, through two Glidden tours and over some of the roughest roads in this part of the country.

The car has given me every satisfaction and I would have no other automobile. I speak this after having had a number of other cars before I purchased a Thomas.

I know of no better way than to say in the words of my company's slogan, "**Eventually**"—

**The Thomas Flyer.**

Yours very truly,

Gus G. Buse,

Washburn-Crosby Co.

# Over 80% of the owners of Thomas Flyers previously owned other cars

They were therefore in a position to judge automobile values—why did they buy

## Because—The Thomas 6-40 Flyer

is the largest, most luxurious, most powerful, easiest riding, most completely equipped automobile constructed.

It is in a class by itself—it has no competitor.

On account of the wonderful flexibility of its six-cylinder motor and its excessive power, it is not necessary to "rush" hills or travel fast over bad stretches of road.

Due to its length of wheel base and splendid spring suspension this car rides over the worst roads and hills without discomfort.

It is possible to travel a greater distance in a day's run—you avoid the frequent necessity of slowing down to change gears.

Except for its reserve power, it is practically the same car that thrilled the heart of every true American by winning the 22,000-mile Endurance Contest Around the World.

If you motor, why not the car that is sure to afford you the most pleasure? That is what you have a car for.

**Price \$6,000 with complete equipment**

## The New Thomas 6-40 "Long Stroke" Flyer

This car is rated at 40 horsepower—it actually develops 60 on test.

Its six-cylinder vibrationless motor has a flexibility which is wonderful—from 2 to 60 miles per hour on high gear.

The price is \$3,500, with complete equipment, including silk mohair top, folding glass front, speedometer, shock absorbers, acetylene headlights, oil side and tail lamps, horn, robe, rail, tire irons, Prestolite tank and a complete set of tools.

## EXTRA HEAVY NON-SKID TIRES

### Defy Winter Storms!

☞ No matter how wet and slippery the pavement, AJAX Extra Heavy Non-Skid Tires will bear you smoothly, safely, and surely to your journey's end.

☞ AJAX Extra Heavy Non-Skid Tires are *actually and absolutely non-skid*, because the rectangular studs have bevelled edges all around and this arrangement positively prevents skidding or slipping whether moving sideways, forward or backward. The weight of the car pressing the bevelled edges on the wet pavement, compresses the air between the rubber studs and creates a positive suction. Steel-studded tires are not non-skid because on wet, slippery pavements they slide like steel runners on skates. Rubber-studs with curved or non-bevelled edges are non-skid only when moving sideways, but not forward or backward.

☞ The scientific construction of the AJAX tread provides *non-skidding insurance*, and the AJAX Guarantee of 5000 Miles or 200 Days' Service provides *service insurance*.

☞ The AJAX Guarantee is your tire insurance policy. Write for a copy and get tire wise.

### THE AJAX AIR GAUGE

☞ Ninety per cent. of all tire trouble is occasioned by under-inflation. The AJAX AIR GAUGE, manufactured by A. Schrader's Sons, Inc., makers of the Schrader Valve, will give you the exact pressure in your tires, regardless of size, simply by placing the Gauge over the valve. Can be carried in the vest pocket. Actual size, 3 1-2 inches long by 1-2 inch diameter. Nickel finish. Price \$1.00. For sale by all dealers. On exhibition at the AJAX booths at the Palace and Garden Shows, New York City.

# Standard Equipment

## **Mr. Motorist:**

You will never know the real enjoyment of motoring until you use Standard Equipment. Each of the accessories shown on the opposite page is an actual necessity. They reduce cost for "upkeep" and bring every car up to maximum efficiency.

Don't pay thousands or even hundreds of dollars for a car and ruin it with poor equipment. Standard Equipment enhances the value of every automobile—adds to its efficiency and appearance. Means double the life, double the service, double the comfort.

Start the New Year right. Buy some portion of Standard Equipment to-day. If you buy a new car ask to have it Standard-Equipped.

---

**UNITED MANUFACTURERS, Inc.**

**BROADWAY AND 76th STREET**

**NEW YORK**

## "GEARED TO THE TRUTH"

The Jones Speedometer has a Direct Drive. The hand of the Jones feels the road—feels the speed—measures it mechanically. The Jones hand is connected with the road by a metal-to-metal shaft-and-gear connection. The Jones is the only speedometer that is mechanically "Geared to the Truth." In all other speedometers direct transmission is broken. The hand feels no gripping speed connection. There is a gap. Direct drive never weakens. Use the instrument that is "Geared to the Truth."

## THIS IS THE STANDARD EQUIPMENT FOR YOUR AUTOMOBILE

Each of these products is a motoring necessity—really essential to the safe and complete operation of a motor car. Our dealers show this sign. It protects you against the shoddy substitute and the shoddy-service price cutter. It's our trade mark and your guarantee that you are getting genuine Standard Equipment

## SOOT-PROOF SPARK PLUG

Soot-Proof Spark Plugs don't prevent the accumulation of soot, but they put the soot where it can't do any harm. You can't short-circuit a Soot-Proof Plug. Get a set to-day.

## MEZGER AUTOMATIC WINDSHIELD

Up or Down with One Hand Without Slackening Speed

Perfect protection in all kinds of weather from wind, dust and cold. No dust. No dirt. Absolute comfort and protection. Get the Mezger Automatic and throw your goggles away.

## USE NON-FLUID OILS

for lubricating transmission and bearings and USE MoToRoL for lubricating cylinders. In a recent test by the Sharp Arrow Auto Co. a car lubricated with NON-FLUID OILS ran 20,000 miles without showing any wear. That's about five years' average service! Is your car insured for five years to come? After similar tests, over sixty auto manufacturers have adopted NON-FLUID OILS and recommend them to purchasers of their cars. MoToRoL is the best cylinder oil in the market—use it.

## Ignition Specialties

EVERYTHING FOR IGNITION

We make the famous Connecticut Coil for automobile, motorcycle and motor boat use. Timers, Distributors, Current Indicators, Volt-Ammeters, Terminals, and, best of all, a new Connecticut Magneto and Shock Absorber, which will soon make their appearance. If you want perfect ignition buy "Connecticut" products.

## WEED ANTI-SKID CHAINS

BUY A SET OF WEED CHAINS TO-DAY

They're "as necessary as gasoline." Weed Chains eliminate danger—make motoring safe. Everybody uses them because it's simply impossible to tour over muddy roads, snow-covered roads, slippery or greasy asphalt and wet pavements without Weed Chains. They positively prevent skidding. But we urge you to beware of spurious Weed Chains. Genuine Weeds have brass plated cross chains and the name Weed is stamped in the hooks. Be sure you get 'em.

## THE UNITED MANUFACTURERS

Is the Co-operative Sales Force of five of the oldest and most successful automobile accessory manufacturers, i.e., Connecticut Telephone and Electric Company, The Jones Speedometer, C. A. Mezger, Inc., New York and New Jersey Lubricant Company, and the Weed Chain Tire Grip Company.

We fill mail orders only if you mention your dealer's name and address, so that we can adjust the matter with him.

# Woodworth Treads

## REASONS FOR TIRE PROTECTION

It is a fact that the great bulk of all delays and annoyances incident to motoring are caused by some form of tire trouble.

The weight of the car, with its occupants rests on a cushion of air and rubber, and any device which tends to prevent the destruction or wear on the latter is worthy of intelligent consideration.

## WOODWORTH TIRE PROTECTORS

Are as necessary a part of an automobile equipment as the tires themselves.

**BECAUSE** they prevent punctures.

**BECAUSE** they will not allow the tires to become worn or cut on the outside surface.

**BECAUSE** the projecting steel studs reduce the danger from skidding on icy or slippery roads.

**BECAUSE** they will not chafe or heat the tire.

**BECAUSE** they can be easily adjusted or removed in a few minutes.

**BECAUSE** they will not allow moisture or dirt to penetrate the rubber and rot the fabric.

**BECAUSE** they lengthen the life of the tire from 5 to 6 times.

**BECAUSE** they are no detriment to the appearance of the tire itself.

**BECAUSE** tires using our treads are good for from 25,000 to 50,000 miles.

LET US TELL YOU ALL ABOUT IT.

# Stoddard-Dayton

## An Excellent Utility Roadster—\$2000 [F. O. B. Dayton]

Built upon identically the same lines which have made "K" familiar to all lovers of a winner, the Stoddard-Dayton 10-C is a Roadster just a bit smaller than its big victorious counterpart. "C" is a spunky-looking car, and really shows in its looks the good stuff that is in it. For the business man who finds the "H" Runabout too small, and the "K" Roadster too big for his purpose, 10-C serves well. It is an excellent utility car for business and a crackerjack among roadsters — plenty big enough to make other cars rated higher in power take its dust. The same rakish body design which makes "K" notable in appearance — no matter in what company it is found — is followed out in the 10-C, which is a 40-horsepower machine. These Stoddard-Dayton Roadsters are up to snuff in any company. They look well. They do well. In all of them, the Stoddard-Dayton never-changing platform of *performance* is carried out. Speed, SILENCE and reliability are certain Stoddard-Dayton assets.

All frames are of pressed steel, made in our own factory. The rear springs, this year are three-quarter-elliptic, tempered in our own spring shops, and made of high-grade crucible steel. These are far superior to the semi-elliptic used last year, as they make for the greatest possible ease and comfort in riding.

The gasoline tank is now placed at the rear being mounted in curved brackets, symmetrical with the upper part of the three-quarter-elliptic springs.

Every possible point requiring lubrication, that is not taken care of by an automatic self-contained oiler, has been provided with a grease cup.

"C," as equipped above, is a three-passenger car. If desired, the rear seat may be double rumble, a duplicate of the front seat, or a single undivided wide, at extra cost.

The wheelbase is 116 inches. Wheels, 34 x 4. The ignition system is Pittsfield magneto and battery. (Dual system.)

The above price includes full equipment—five lamps, Prest-O-Lite tank, etc.

# Stoddard-Dayton

# Pullman

MODEL "K" \$2000

## Fundamentally Right for Six Years

The motor in the 1910 models is exactly the same in principle and all essential features as the motor in the first car built by this company, thus proving that its original designer, A. P. Broomell, started on correct mechanical lines. The record of the Pullman in private service and public tests has induced a close adherence to these "First Principles,"—throughout six years—though refinements have been made year by year, reaching their climax of perfection in the 1910 models, which were designed by Guillard, formerly of the Clement-Bayard, Mercedes and the Benz factories of Europe.

The body design and appointments, the control, the braking system, the exclusive oiling system, the semi-elliptic springs, the roomy tonneau, and other vital features all combine to make the Pullman a car of exceptional beauty, easy riding qualities and lasting service.

# Our First Model Didn't Cost \$80,000

One maker of a car that sells in the one to two thousand dollar class has confessed it cost him \$80,000 to build his first model. It has since cost this same maker many additional thousands yearly in factory changes—in new models. He is still making and selling cars. Can you doubt that every car he now turns out has a certain percentage for experimental outlay taxed against it?

Inter-State "40," Model 30  
Touring Car, seats five—\$1,750

Inter-State "40" Touring Car, Model 30. 118 in. Wheelbase;  $4\frac{1}{2} \times 5$  in. Motor, U. & H. Imported High Tension Magneto; Double Ignition System; Multiple Disc Clutch of 63 tempered saw steel plates; Three-Quarter Elliptic Rear Springs;  $34 \times 4$  in. Tires and many other high priced features.....

**Price, \$1,750**

## The High-Grade ~~Inter-State~~ at a Fair Price

We have no history of costly experiments behind us. We have not been changing models yearly—or abandoning costly machinery.

Manufacturers of the higher priced cars have spent many thousands of dollars in costly experiments.

We do not have to get money spent in such ways back from the people. We began to build the Inter-State after motor car practice and design had been standardized. So we give full value, dollar for dollar.

It can only cost just so much to build the highest grade car. Values of parts and the cost of their construction have a limit. A maker's outlay on a car can be the cost of the best possible in every way, and in construction—that is all.

We spend all that can be spent in making this highest grade car—in both materials and construction.

For instance, we spend all that can be spent on a motor. We get the highest efficiency possible.

The motor in the Inter-State has all the refinements of con-

struction, all the materials that go to make up the best known motors of the highest priced cars.

All the improvements, all the refinements that distinguish the 1910 Inter-State models have been tested and proved out. They fulfill all the requirements of the best motor car practice. They are found only in the highest priced cars—other than the Inter-State.

Yet we can afford to sell the Inter-State for \$1,750—at a fair manufacturer's profit, such as is obtained in other lines. Judging by automobile values as you have known them until now, we could get a far higher price than the \$1,750 we ask for the Inter-State.

Since in the Inter-State you get all you can secure in any car at any price, you'd hardly think we asked too much if we asked far more.

Send for our 1910 catalog so you can see for yourself why you can get no more in high priced cars than in the Inter-State—unless perhaps more power than you can use—for no car at any price can give you more than the Inter-State in material, workmanship, speed, durability, comfort or beauty.

### MR. DEALER: Is this the kind of a Proposition you want?

We aim to treat the dealer who handles INTER-STATE cars with fairness. We make and sell cars which we are prepared to deliver, and our policy is to make only those contracts which we are able to fulfill. We will not accept deposits on more than the number of cars we shall build. We do not need dealers' deposits to help carry on our business, but merely as a guarantee of good faith.

### Or, do you want to finance some Manufacturer's business?

# GRAY & DAVIS

## Unit Dynamo System for Incandescent Arc Lighting of Automobiles

We have realized for some time that electric lighting for automobiles was the solution of the lighting question.

Therefore, we have designed and perfected a system, having constantly before us the experience and troubles of all that are on the market, both here and abroad, and our unit system comprises :

1st. Constant speed dynamo, to be driven from the engine or jack shaft, by gear, belt or chain.

2nd. Governor of extra large capacity to take care of excessive engine speeds.

3rd. Electric cut out to cut out dynamo when running below charging speed and also to cut out dynamo when battery is charged.

4th. Battery to run lights when car is standing or running below dynamo speed.

All above so designed and apportioned as to form one harmonious unit.

With our system we have perfected an

### INCANDESCENT ARC LIGHT BULB

that is a point of light (the ideal for reflecting) that consumes but 1 watt per candle power and when used with our Parabolic mirror will give about three times the light of the strongest acetylene searchlight and light can be turned off or on at will to conform to various city ordinances.

 Will be Exhibited at Both New York Automobile Shows

# THE SELDEN CAR

MADE BY THE FATHER OF THEM ALL

THE SELDEN LINE OF CARS FOR 1910 EMBRACES THE FOLLOWING MODELS:

Model 35-T, Five-Passenger Touring.....	\$2,000
Model 35-R, Three-Passenger Roadster .....	2,000
Model 35-P, Four-Passenger Torpedo Tonneau (with Bosch Magneto).....	2,250
Model 35-S, Seven-Passenger Touring, (with Bosch magneto) .....	2,500
Model 35-L, Six-Passenger Limousine .....	3,000

Our four cylinder motor is  $4\frac{3}{4} \times 5$  (A. L. A. M. Rating 36.1 horsepower); wheel base is 122 inches on the seven-passenger, 116 inches on the others; clearance 10 inches on all; Bosch magneto, Stromberg carburetor; wheels, 36 inch on the seven-passenger, 34 inch on the other. The high quality and faultless construction of every Selden car produced is guaranteed. We do not build cheap cars. The car shown above is the famous "Torpedo Tonneau."

## Here are some fresh ones just off the bat:

I have been so busy demonstrating my car that I have neglected to advise you what the car is doing. We can do anything that any other car can do, regardless of price or name, on hill climbing or on the level, and we have done things on the hills where other cars of twice the price have failed.

W. L. SIMPSON, Punxsutawney, Pa.

December 7th, 1909.

I have received and tried out to a certain extent the 1910 model. I will not criticize it in any point. I will congratulate you. After I have run the car 1,000 miles will give you my opinion of what I consider a remarkably fine car—your 1910 product.

F. A. NICKERSON, Portland, Me.

December 13th, 1909.

We ran your 1910 car from Saratoga Springs to Utica last Sunday over very rough and icy roads in five and one-half hours, never changing the gear the entire distance, which, as you know, is a very hilly country most of the way; the car is running better every day.

W. L. GEE, Utica, N. Y.

December 17, 1909.

I made a trip yesterday over very hilly country roads, and the car gave perfect satisfaction in every way. It was remarkable, the power it developed. The Torpedo has created quite a sensation.

J. H. VAN BRUNT, St. Joseph, Mo.

December 22, 1909.

Exhibitions will be made at Madison Square Garden, New York, January 8-15, and at Coliseum, Chicago, February 6-13.

## AGENCIES WANTED IN UNOCCUPIED TERRITORY.

**SELDEN MOTOR VEHICLE CO.,**

**GEO. B. SELDEN,**  
President.

**Rochester, N. Y.**

Licensed under Selden patent.

Members Association of Licensed Automobile Manufacturers.

## You can hammer the cross links of **THIS** Anti-Skid Chain with a sledge hammer, but you **CAN'T MAKE** them cut the tires.

The Fox Anti-Skid Tire Chain prevents skidding absolutely. It is the only chain which does. We stand behind this statement fully—it will keep your car from skidding. It will enable you to use your car on days when you would not dare take it out otherwise.

You are **SAFE**, your car is safe when equipped with Fox Chains, no matter what the condition of the roads—safe on slippery, greasy asphalt, on ice and snow covered macadam, on slimy cobbles, on car tracks—on any road or street. Fox Anti-Skid Chains will enable you to use your car sixty days—**two solid months**—more in a year than you can without them.

### The Fox Chain **WON'T** Hurt Your Tires

Of course you have had perfectly good shoes cut to pieces by chains. Of course you have had great holes gouged in them by the cutting links of the chains, and so ruined in one day's driving, shoe after shoe which would have been perfectly good for a thousand miles more, had not the chains cut them to pieces. Most

motorists dread to put on chains almost as much as they dread to skid.

### The Fox is **NOT** That Kind of a Chain

In the Fox, no edge, no cutting surface of any kind comes against the tire. Nothing except a broad, flat, perfectly smooth metal surface **without edges**, touches the tire. The broad, flat links fit the shoe as harmlessly and as closely as a piece of tire tape. If you should swing a heavy sledge hammer against the links of the Fox Cross Chain, not once, but **many times**, you **could not make it cut into the tires**. If you should do this with other chains, you would quickly drive the links into the rubber and cut a **great hole**, perhaps with the very first blow.

Fox Chains have proven by actual service of the hardest sort in the hands of private car owners that they wear for over three thousand miles where other chains go to pieces in three hundred miles. They cost a little more than other makes but they will wear many times as long and during their life will save you **several hundred dollars** in tire expense over other chains.

**EXHIBITING AT ALL SHOWS. COME AND SEE THE FOX FOR YOURSELF**

## TO THE TRADE

Would you like to have us **GUARANTEE** to you the sale of 1-2 dozen sets of Fox Chains?

Would you like to have us **SHARE** with you a profit we already have?

## METZGER ABSORBS HEWITT ENTIRE

**Detroit Company Finally Attains Its Ends—  
Gets Selden License and Now Will  
Build Trucks, Too.**

Despite the previous positive declaration of E. R. Hewitt, president of the Hewitt Motor Co., New York, that neither his company nor the Selden license which it held, would be sold to the Metzger Motor Car Co., Detroit, which was bidding for the license, both the Hewitt company and the license have been sold to the Detroit concern.

After a long period of negotiation the deal finally was closed late last Friday night and the Hewitt Motor Co. will pass out of existence, the Metzger people having acquired its entire assets. They will continue the manufacture of Hewitt trucks, however, in connection with the production of the Everitt touring car. In fact, the consummation of the deal portends a general development of not only commercial vehicles of all tonnages, but of taxicabs and sight seeing vehicles also.

When, a few months since, the Metzger company was organized by W. E. Metzger and his associates, B. F. Everitt and William Kelly, they anticipated little or no trouble in securing a Selden license, Mr. Metzger having been one of the earlier directors of the Association of Licensed Automobile Manufacturers and being "close" to many of its most influential members. They, however, refused to be swayed by their friendship or personal regard, but not to be denied Metzger, Everitt and Kelly opened negotiations with the Hewitt Motor Co., one of the early licensees, whose output, however, has been limited, and though the Hewitt principals at first declined to sell and instead suggested an alliance that would permit the Everitt car to be produced under their license, the Detroiters pressed their case until, as stated, they brought the Hewitt company to their way of thinking,

and absorbed all its possessions. The consideration involved has not become known.

### Reeves to Become A. L. A. M. Manager.

Alfred Reeves, at present occupying the same office in the American Motor Car Manufacturers Association, will become general manager of the Association of Licensed Automobile Manufacturers, on Thursday next, 13th inst. A meeting of the latter organization has been called to occur on that date "for the purpose of electing a general manager" and that Reeves is the man who will be elected there is no doubt. It is well known that the position was offered to Reeves some time since and that he declined it and had about decided to enter the trade on his own account. Meanwhile, the tender was so insistently repeated that Reeves was induced to change his mind, and it is generally understood that to his acceptance is due the call for next week's meeting. The office of general manager of the A. L. A. M. has been vacant for several years. M. J. Budlong was the last man to fill it, and since his resignation the duties have been performed by two successive assistant general managers.

### Michelin's New Manager Appointed.

Following the retirement several weeks ago of J. C. Matlack from the Michelin Tire Co., J. Hauvette-Michelin has been elected vice-president and general manager, with headquarters at the general offices and factory, at Milltown, N. J. The newcomer is a nephew of Edouard Michelin, head of the varied Michelin interests. He has had long experience abroad, both in the manufacture and sale of Michelin tires.

### Eisemann Magneto in New Hands.

The American rights to the Eisemann magneto have been transferred from Lavallette & Co., New York, to a new company, the Eisemann Magneto Co., which hereafter will handle the instrument in this country. The new concern, which will formally organize next week, already has leased the entire sixth floor at 225-227 West Fifty-seventh street, New York.

## M. A. M. RETAINS ALL OLD OFFICERS

**No Changes Made at Annual Election—  
Notes of Warning Sounded at Both  
Meeting and Banquet.**

At the meeting of the board of directors of the Motor and Accessory Manufacturers, Inc., held in the association's headquarters this (Thursday) morning, all of the incumbent officers were re-elected, as follows: H. E. Raymond, B. F. Goodrich Co., president; H. T. Dunn, Fisk Rubber Co., first vice-president; F. E. Castle, Atwood-Castle Co., second vice-president; Clarence E. Whitney, Whitney Chain Co., third vice-president; W. S. Gorton, Standard Welding Co., treasurer; Peter S. Steenstrup, Hyatt Roller Bearing Co., secretary. A new office was created for W. M. Sweet, who, in the capacity of assistant secretary, has been in charge of the New York headquarters. He has been made general manager of the association.

The annual meeting of the Motor and Accessory Manufacturers, Inc., and the banquet which followed it easily were the largest and most important trade gatherings of the week. Both occurred last evening (Wednesday) at the Waldorf-Astoria.

The most important transaction at the business session was the selection of four three-year directors, but the election resulted in no change being made, the incumbents being chosen to succeed themselves, as follows: D. J. Post, Veeder Mfg. Co.; L. M. Wainwright, Diamond Chain & Mfg. Co.; George Byrne, Byrne-Kingston Co.; H. Winfield Chapin, Brown-Lipe Gear Co.

The report of the secretary disclosed that there are 173 members on the roll, while the treasurer's report showed a cash balance of \$16,714. The total receipts of the fiscal year were \$71,512, and the total disbursements \$54,798.

The report, however, which was most warmly received, and which created the

greatest enthusiasm was that rendered by the president, Howard E. Raymond. It was crisp and to the point and was delivered in a vein which added to its effectiveness. Mr. Raymond sketched the work of the year, which included the establishment of well appointed offices in New York which, among other things, offers personal conveniences to all visiting members.

While the several standing and special committees had rendered notable services, Mr. Raymond said that no department of the organization had proved so satisfactory as its credit bureau. There are 140 members using it and the interchange of information, not between one or two members, but between different groups of members, had proven invaluable. The various credit reports obtained during the year are to be printed in book form.

The one committee which had nothing to do was the Conference Committee, due to the fact that relations with the car builders associations are on a solid basis and to the existence of "warm mutual respect and confidence."

Additional groups are to be added during the current year to those sub-divisions or committees—on tires, lamps, forgings, chains, etc.—which were created last season. Of the work of these groups, Mr. Raymond said: "This is going to be a most important subdivision of our membership for effective work some day. Ahead of this industry is a certain need for cohesive action among the parts makers. It may not be this year or next but it is ahead. Matter is in the making that will tax our ingenuity to meet and meet right. We have a necessity to insure that no hurdle is erected that we may not be able to jump over. It will, we believe, be possible through this organization, to prevent it."

The feature of Mr. Raymond's report, however, was his reference to the show situation, in which he remarked not merely the manner in which show promotion is being overdone, but sounded a note of warning regarding the danger of over-exploitation which menaces the industry.

"We now live in a show atmosphere," he said. "The situation is becoming acute. It is almost a question if we and our sister organizations are engaged in the manufacture of a product and its sale, or a show proposition to be exploited by the various elements who believe in shows for revenue or otherwise. I do not so much refer now to legitimate dealers shows even though they may be growing at an alarming rate until we have hardly a city of any size not on the calendar for one. . . . The board is endeavoring to be protective of your interests in proper restriction of the spread of the show spirit, not harmful. The industry is in greater danger of over-exploitation than under. There is a greater danger of waste in expenditure of money than undue saving. There is a spirit of menace abroad to the selling organizations that unless checked will leave on the shores of time the wrecks

## E-M-F SUES AND IS SUED AGAIN

**Charges Minority Directors with Misconduct and Studebakers Again Seek Injunction—Merger Project Aired.**

All the causes which led to the rupture between the E-M-F. Co. and its selling agents, the Studebaker Automobile Co., to which a few others have been added, are to be threshed out again in the United States Circuit Court at Cincinnati, Ohio, this afternoon, but this time before another judge, Hon. J. W. Warrington, who has consented to hear the case. Two others already have passed on it.

The new proceeding was instituted on Monday last by the Studebaker company and in effect seeks the same end as the previous actions, viz.: an injunction restraining the E-M-F. Co. from selling or delivering its cars to other than the plaintiffs, and from publishing such advertisements as have been published. The complaint practically is an amplification of the one which Judge Swan in Detroit permitted the Studebakers to withdraw last week, subject to certain conditions.

The most sensational feature of the new complain is an accompanying affidavit made by F. S. Fish, chairman of the Studebaker company's executive committee, who also is one of the minority directors in the E-M-F. Co. It confirms the story printed exclusively in the Motor World that a gigantic merger and floatation had been projected, Mr. Fish admitting that he had attempted to promote an enterprise of the sort, but he charges that Walter E. Flanders, president of the E-M-F. Co. was the author of the idea and that at his suggestion he had sought to interest at least one other E-M-F. director in the project. In his affidavit Mr. Fish also declares that Hayden Eames, general manager of the

Studebaker company, had no legal right to bind the company to take 15,200 E-M-F. cars as per the schedule or agreement arranged in August last year. It was the failure of the Studebakers to take the monthly allotments specified by this schedule that caused President Flanders to annul the contract or agreement and thus sever the relations existing between the two companies.

Meanwhile, the E-M-F. directors have held a meeting and by majority vote formally ratified Mr. Flanders' action; Messrs. Fish, Studebaker and Eames, the minority directors were present and sought to have the ratification deferred, but, of course, they were outvoted. But pending the result of the new proceedings, the Studebaker company has advised agents with whom it had executed contracts for E-M-F cars to protect themselves by signing up with the E-M-F Co.; these advices added that all deposits that had been made for such cars would be returned.

The E-M-F Co. has not been wholly idle in respect to aggressive litigation, having instituted suit designed to oust from its board of directors Messrs. Fish, Eames and Studebaker, who immediately after the rupture and in their capacities as minority stockholders, applied for and obtained a restraining order that temporarily tied up the E-M-F operations.

It appears that there is an old Michigan statute which gives circuit courts jurisdiction over the actions of directors in domestic corporations, where bad faith and gross misconduct are charged, and the E-M-F Co. has instituted an action under this law, alleging misconduct on the part of Messrs. Fish, Studebaker and Eames. The various causes leading up to and subsequent to the trouble are recited, and it is alleged that the actions of the three minority directors were parts of a plan by which they expected to get control of the E-M-F Co. and make it part of an \$80,000,00 merger, which they had been fostering.

of what might have been valuable and self-respecting young men. And this organization will have failed in one of its duties should it not strive to alter and amend this tendency."

The banquet which followed the business meeting was largely attended, probably 200 persons being present. Job E. Hedges served as toastmaster and was in rare good form. His wit and epigrams really were the feature of the occasion, of which he struck the keynote when he said: "So conduct and live your business life that when you put out the light and are alone in the dark, you will have no reason to feel uncomfortable." There were but five speakers. H. O. Smith, chairman of the American Motor Car Manufacturers Association, spoke of commercial honesty—honesty of competitors to each other and to the public, and appealed for a

closer understanding between the car manufacturers and the parts producers. Col. George Pope, treasurer of the Association of Licensed Automobile Manufacturers, spoke in behalf of that organization and received a spontaneous and almost affectionate greeting that must have warmed even his warm heart. He said that the A. L. A. M. stood for the good of the industry and against its exploitation, and he, too, told the parts makers that they owed it to themselves to watch their credits and not to assist mere speculation and exploitation. "Shape a safe course and keep to it," he urged. "Do not be carried away by the enthusiasm of today, which so often leads to the regrets of tomorrow." The other speakers were Lewis R. Speare, president of the American Automobile Association; John C. Wetmore, representing the press, and Senator Martin Saxe.

## NOVEMBER EXPORTS MOUNT HIGH

**Increase Amounts to Nearly \$400,000—  
Gains Made in All Directions, but  
Average Price of Cars is Lower.**

Exports of American cars during the month of November show no interruption of the increase noted in the preceding months. Fully five times as many cars were exported during this month as in November, 1908, the two quantities being 464 and 87, respectively.

The average value of the exported cars decreased from \$1,666 to \$1,001 per car. The aggregate value of the 464 cars was \$464,567; that of the parts, \$99,389; the total value of both being \$563,956, compared with \$187,920 in the same period of last year. The gain in car values over November, 1908, amounts to more than 230 per cent.; that in the value of parts to nearly 120 per cent.

The greatest actual gain is shown by Canada, which took \$141,647 worth, compared with last year's \$28,342. The greatest proportionate advancement was made in Australia, where a mere bagatelle of \$666 in November, 1908, had grown to \$54,700 a year later. South America also took a leading place among the buyers of American machines, increasing its quota from \$5,567 to \$52,965. The increase was general all along the line, Italy alone excepted; that country took \$7,000 less than a year ago.

For the eleven months ending November 30th, the aggregate gain amounted to \$2,502,159. During this interval 3,228 cars were exported, as against 2,005 in 1908, the gain in car values amounting to \$2,269,124, while parts values improved to the tune of \$233,035. Twelve of the fourteen countries stand on the plus side, with British North America leading and the United Kingdom, France and British Australasia following in the order named. Italy and the British East Indies are on the minus side, with an aggregate loss of only \$21,130. The report in detail:

	November 1908	November 1909	Eleven Months Ending November 1907	Eleven Months Ending November 1908	Eleven Months Ending November 1909

## More Additions to Licensed List.

Before the executive committee of the Association of Licensed Automobile Manufacturers adjourned on Thursday last, they granted Selden licenses to three more manufacturers, viz.: York Motor Car Co., Pullman cars; Regal Motor Car Co., Regal cars; Mora Motor Car Co., Mora cars. The Hewitt Motor Co.'s license was amended to include Everitt cars as well as Hewitt trucks. The following day, the Metzger Motor Car Co., makers of the Everitt cars, acquired the license and other assets of the Hewitt company. Those to whom licenses were granted at Wednesday's session of the A. L. A. M. executive committee, as exclusively stated in the Motor World last week, were the Brush, Bartholomew, Buckeye, Moline, Moon, National and Nordyke & Marmon companies.

## Detroit Men in Canadian Project.

To build automobile engines for the Canadian trade the Dominion Motors, Ltd., has been organized in Windsor, Ont., opposite Detroit, with A. J. Kinnucan, formerly purchasing agent of the Brush Runabout Co., as general manager. The concern has been incorporated under Canadian laws with \$150,000 capital and has commenced the erection of a fireproof factory in Windsor. The product will be a four cylinder car of 35 horsepower, designed by E. W. Winans, who is at present engineer of the Regal Motor Car Co., but who will be engineer and factory manager of the new company. The car will be styled the Royal Windsor and it is expected that deliveries will commence June 1st.

## Poole to Push Electrics in Europe.

John L. Poole, who has made a specialty of export trade and who in that capacity was stationed abroad for several years, first in the interests of the Olds and later for the Buick company, has engaged with the Babcock Electric Carriage Co., Buffalo, N. Y., and will at once organize an export department. Poole believes that there is considerable room abroad for American electrics, and his new mission, of course, is to put them there.

## WHITE'S OPINION OF OLYMPIA

**Afforded Unequalled Opportunities for  
Study, He Says—The Tendencies and  
Designs Very Clearly Defined.**

"As Paris and Berlin did not hold shows this winter the London show in Olympia Palace had no competition and was a much greater affair than many Americans may imagine was the case," says Walter C. White, second vice-president of the White Company, who returned from London a few days since.

"More automobiles were shown in Olympia than ever before were brought together in a single exhibition. To be specific, in last month's London show there were 597 complete cars and chassis, against 575 at the 1908 Paris show and 381 at the last Chicago show. In past years, some of the Continental makers have not exhibited their products in London, and on the other hand some of the English makers have not taken their machines over to Paris, with the result that one really had to visit both shows in order to see everything. This year at Olympia the world's greatest cars were all shown on one floor under one roof, and unequalled opportunities were afforded the critical visitor to study the latest tendencies in motor car construction.

"The car of moderate size, moderate power and moderate price was supreme. It is hardly an exaggeration to say that the leading car of every exhibitor was of that type. As regards details of construction, there was, of course, the widest possible divergence just as there is at any show, owing to the fact that different makers 'stand pat' at different points along the path of progress. But as soon as the visitor to Olympia limited his study only to the cars of world-wide reputation which have from year to year practically set the pace in design, the resemblance was so startling as to demonstrate that the leading designers, in their striving for the ideal car, have all been led by the logic of the situation toward a certain standard.

"The block engine construction—the casting of the four cylinders in one piece—has been adopted by every foreign maker who has brought out a newly-designed car in the last two years, and the same applies to the long stroke engine, as the advantage of these features have been thoroughly demonstrated. With the adoption of the block engine, there is a well-defined tendency to simplify the engine by reducing the amount of piping, wiring and other outside appurtenances. Those makers who have made the most progress along these lines have eliminated all external manifolds and have included the intake and exhaust passages within the engine casting. By this construction, they have gained the further important advantages of heating the intake

gases and water-cooling the exhaust gases, thus making a great stride forward in economy of fuel, besides increasing the amount of power obtainable from a cylinder of a given size. As regards ignition, the majority of the leading makers depend entirely upon the magneto. Another feature which has become practically standard construction is the use of a four-speed transmission in the high grade car of moderate power.

"It was naturally a source of much gratification to me that our new gasoline car was ranked with the five or six leading foreign makes as being of the most advanced design and that our steam car is maintaining its position as one of the most popular cars in England.

"The English industry is recovering from the depression of a year or two ago and has settled down to a stable basis. I visited a number of the English factories and found that most of the well-established makers were prospering, but there has been a great weeding out of the concerns which were launched during the boom times without adequate resources to do business and to look after their customers except in boom times."

#### **Parker Motors Ready for Marketing.**

The first product of the Parker Motor Co., Hartford, Conn.—a four-cylinder motor—has made its appearance on the market. It is of the 4 cycle, water cooled type, 4½ by 5 inches, developing 32.4 horsepower by A. L. A. M. rating. The L cylinders are cast in pairs, offset one inch, the valves all being arranged on one side. Lewis D. Parker, the president and general manager of the new company, formerly was the head of the Hartford Rubber Works Co., and is therefore not a stranger either to the automobile trade or its wants.

#### **Schwartz to Manage Metz's Sales.**

W. H. Schwartz has been appointed sales manager of the Metz Manufacturing Company, Waltham, Mass. Several years ago he was identified with Mr. Metz, when the latter was the head of the Waltham Manufacturing Company, but more recently Schwartz has been acting as manager of the Olds-Oakland Motor Company of Boston.

#### **Stoll Pressed Steel Organized.**

The Stoll Pressed Steel Co. has been organized in Buffalo, N. Y., for the manufacture of automobile frames and metal stampings. Articles of incorporation have been filed under New York laws, giving the concern a capitalization of \$50,000, the incorporators being Daniel H. Stoll, Charles C. Hornung and others.

#### **Connecticut Increases Capital to \$250,000.**

The Connecticut Telephone & Electric Co., of Meriden, Conn., has filed a certificate of increase of capital stock from \$40,000 to \$250,000. The new money will be used in extending the business.

#### **The Week's Incorporations.**

Detroit, Mich.—U. S. Auto Top Co., under Michigan laws, with \$20,000 capital.

• Saginaw, Mich.—Davis Draper Auto Co., under Michigan laws, with \$3,000 capital.

Brockton, Mass.—Pickard Bros. under Massachusetts laws, with \$100,000 capital; to manufacture automobiles.

Auburn, Ind.—Auburn Automobile Co., under Indiana laws; capital stock increased from \$25,000 to \$75,000. President, Charles Eckhart.

Terre Haute, Ind.—Haworth-Cole Auto Co., The, under Indiana laws, with \$1,000 capital. Corporators—A. B. Haworth, H. J. Cole and D. V. Miller.

Indianapolis, Ind.—Ricketts Auto Co., The, under Indiana laws, with \$30,000 capital; to manufacture auto parts. Corporators—R. Ricketts, L. F. Ricketts and E. Ricketts.

Chicago, Ill.—Enterprise Automobile Repair Co., under Illinois laws, with \$2,500 capital; automobile and repair business. Corporators—Charles G. Woll, C. W. Huck, J. E. Hurtubis.

Chicago, Ill.—F. E. Z. Auto Sales Co., under Illinois laws, with \$10,000 capital; manufacturing and merchandizing. Corporators—F. H. Ball, H. L. Blum and Gertrude Herschman.

Detroit, Mich.—General Motors Co., of Michigan, under Michigan laws, with \$10,000 capital. Corporators—W. C. Durant, Flint; W. J. Mead, Lansing; C. R. Hathaway, New York; C. R. Hathaway, trustee, New York.

Memphis, Tenn.—Memphis Automobile Co., under Tennessee laws; capital stock increased from \$50,000 to \$70,000. Corporators—S. T. Carnes, W. E. Perkins, A. H. Dorsey and William B. Gates.

Rochester, N. Y.—Rochester Drop Forge Co., The, under New York laws, with \$40,000 capital; to manufacture dies, plates, etc. Corporators—Louis M. Beattle, L. W. Hostettler and Fred K. Thompson.

Bayonne, N. J.—Bayonne Garage and Automobile Co., The, under New Jersey laws, with \$5,000 capital; general automobile business. Corporators—John C. Guise, Frederick G. Perkins and Arthur N. Hanson.

Milford, Del.—Milford Garage and Repair Co., The, under Delaware laws with \$5,000 capital; general automobile business. Corporators—William H. Robinson, William A. Webb and Louder N. Hearn.

Haverhill, Mass.—Central Garage, Inc., under Massachusetts laws, with \$10,000 capital; general automobile business. Corporators—Harry F. Small, William J. McDonald, Jacob W. Small, all of Haverhill, Mass.

Trenton, N. J.—C. P. Weeden Motor Co., under New Jersey laws, with \$100,000 capital; manufacturing automobiles, motorcycles and other vehicles. Corporators—Claudius P. Weeder, Jane B. Weeder, Jacob S. Valentine.

Grand Rapids, Mich.—Kent Motor Car

Co., The, under Michigan laws with \$2,000 capital; to manufacture and deal in automobiles. Corporators—Fred B. Clark, Roy L. Leigh and Nelson M. Abernethy, all of Grand Rapids.

Garrett, Ind.—Hoosier Auto Co., The, under Indiana laws, with \$80,000 capital; to manufacture automobiles. Corporators—J. A. Moore, T. C. Little, J. B. Mager, Leigh Hunt, A. C. Widmer, I. A. Gingery, W. W. Sharpless and E. C. Reyher.

Meriden, Conn.—The Connecticut Shock Absorber Co.; to manufacture automobile devices, under Connecticut laws, with \$10,000 capital, to begin business with \$1,000. Corporators—E. C. Wilcox, C. Rogers, R. L. Lawton and L. E. Wilcox, all of Meriden.

#### **General Motors Performs More Magic.**

If ever the Michigan authorities entertained serious notions that they would be able to collect a tax on the \$60,000,000 of paper held by the General Motors Co., of New Jersey, the mainspring of which is located in Michigan, they did not reckon on the joint resourcefulness and a near-Napoleon of the automobile business. For those quick-witted gentlemen apparently have found a way to meet the law's demands and emergencies and to relieve themselves of all but a trifling portion of the burden of taxation which threatened. They have organized the General Motors Co. of Michigan, which was incorporated last week, with a modest capitalization of \$10,000, 90 of the 100 shares being held by Wall Street interests. The corporators or "fathers" of this "little brother of the rich" \$60,000,000 trust are W. C. Durant, Flint, Mich., W. J. Mead, Lansing, Mich., and C. R. Hathaway, New York, each of whom holds one share of stock, the other 97 also being held by Mr. Hathaway, but in the capacity of trustee. Several months ago the Michigan authorities became inquisitive and the official machinery was set in motion to discover whether the stock of the General Motors Co., of New Jersey, properly was not subject to taxation. The last heard of the matter was that a conference of the interested parties had been arranged. The incorporation of the "little General Motors" evidently is the answer to the conference.

#### **Excelsior Established Branch in 'Frisco.**

The Excelsior Supply Co., Chicago, which long has done a considerable business in that part of the country, has opened a branch house in San Francisco at 361-363 Golden Gate avenue. It is in charge of T. A. Skinner, previously one of the company's travelers. The branch will carry a general line of automobile supplies and also the specialties of Excelsior manufacture.

#### **Morgan & Wright Add \$700,000 Capital.**

Morgan & Wright, Detroit, Mich., have certified to an increase of capital stock from \$1,800,000 to \$2,500,000. All of the increase has been subscribed and paid in.

**In the Retail World.**

N. D. Cass has a garage under construction in Athol, Mass.

I. W. Semans has a garage under construction on West Main street, Uniontown, Pa.

Michael Haely, of Bolivar, N. Y., is building a two story cement block garage at that place.

O. D. Sherley is having plans drawn for a modern garage to be built on Summit avenue, Hagerstown, Md.

George Brewer, of Athol Center, Mass., has given out a contract for the building of a garage on Main street.

F. T. Kitt has taken out a permit to erect in Sacramento, Cal., a one-story brick garage at Nineteenth and Twentieth streets.

Pawling & Howard have leased property at 1536-40 Race street, Philadelphia, for garage purposes. Extensive improvements will be made.

A. C. Lorce, of Pisek, N. D., and W. C. Palmer, of Grand Forks, have joined forces to build a garage and machine shop in Grand Forks.

The Maxwell-Briscoe Motor Co. has received a permit for the erection of a two-story brick garage at Illinois and Vermont streets, Indianapolis, Ind.

C. G. Carley and L. B. Warren have formed the Austin Co. in Boston, with headquarters at 94 Massachusetts avenue; they will handle the Austin car.

The F. B. Stearns Co. is the designation of the district agency which has been established at Dallas, Tex., to handle the Stearns product. It is located at 303 Commerce street.

Henry Guttman has accepted designs for a five-story garage building on 167th street, west of Amsterdam avenue, New York City. The building will be 50 by 85 feet and is to cost \$65,000.

W. A. Dunlap has invited bids for a contract to erect a three-story garage building at 5913 Baum street, Pittsburg, Pa. It will be 40 by 95 feet in dimensions, and of brick and stone construction.

The Parker Garage, at Tenth street and Mary Place, Minneapolis, Minn., is completed. It is a fireproof building, 125 by 167 feet, which will be devoted wholly to the storage and care of cars.

Insurance involved in a fire which visited the garage of the Lake View Automobile Co., Chicago, on Christmas day, is estimated at \$50,000. It covers upwards of 30 cars on most of which the loss was total.

Evander Williams & Co.; dealers in vehicles and implements at 48 and 50 South Front street, Memphis, Tenn., have decided to "take on" automobiles. They will handle the Oldsmobile and the Oakland cars.

George W. Hawkins, of Houston, Tex., is to occupy the entire ground floor of a handsome building, 100 by 125 feet, at Main and

Walker streets, to be erected by S. L. and F. L. Gender. He handles the Maxwell cars.

Harry R. Schoch has had plans prepared for a six-story concrete garage and office building at 144-146 North Broad street, Philadelphia. Its ground dimensions will be 51 by 83 feet and the cost is estimated at \$75,000.

Cambridge, Mass., is to have a new garage, erected by Messrs. Shotwell, Fiske and Sargent. It will be located on Wadsworth street, and is to be a brick and concrete structure, 166 feet long, 75 feet wide and two stories high.

Ted Anderson, one of the pioneers in the automobile industry in Minneapolis, Minn., has bought the interests of G. W. Caplin in the big brick garage at Fifth avenue and Fifth street. He had been in the Caplin employ since May, 1904.

B. M. Childress, of Dallas, who recently secured the Brush runabout agency for the State of Texas, has organized the Childress-Brush Motor Co., with himself as its president. C. W. Childress is vice-president, and R. M. Hardeman, secretary-treasurer.

The Lord Motor Car Co., of Los Angeles, Cal., has arranged to lease a new building at Pasadena which Dr. F. F. Rowland is to erect for their use. It will be located on South Marengo avenue, and is to be a brick structure, 66 by 215 feet.

R. L. Greene has bought the garage of the E. R. Clark Automobile Co., at Brattleboro, Vt., and has changed its name to the Brattleboro Garage. He will do some remodeling of the premises and will install a vulcanizing plant and new machinery.

Bailey and Watson have filed plans for a two-story brick garage on the west side of Williamsbridge road, Borough of the Bronx, New York. It will be located near Poplar street, will be 55.27½ by 150 feet in its ground dimensions, and will cost \$40,000.

George Brewer, of Athol, Mass., has bought the Woodis shop on Main street, used as a carriage and paint shop, and will remodel it for garage purposes. The improvements will include a one-story concrete building in front of the old structure.

The "Auto Inn" is the name under which the Connersville Auto and Supply Co. has opened a new garage and repair shop in Rushville, Ind. The company recently bought the business of the Rush Auto Co., in Rushville, and has placed John Kuecht in charge of it.

New Orleans is to have three new garages. A. Aschaffenberg will build a large one with a salesroom on St. Charles street; L. H. Fairchild also will build on the same street; and Emilien Perrin has closed a deal for the erection of a two-story fireproof building at Lafayette and Dryades streets.

Ground will be broken during the latter part of the current month for the new build-

ing which the American Locomotive Co. is to erect in Chicago on the southeast corner of Twenty-fifth street and Michigan avenue. The building will be of fireproof construction throughout, and will be four stories high.

The first really modern garage building in Lewiston, Me., is to be erected by a new corporation composed of Lewiston and Auburn men, who have incorporated with a capitalization of \$200,000, to deal in automobiles and agricultural implements. They will provide for the automobile end of their business first, and the building to be erected will be 50 by 100 feet in ground dimensions, and two stories high. Charles F. King, of Portland, Me., is president of the company, with Henri P. Bechard, of Lewiston, as treasurer and Napoleon Hamel, of Lewiston, secretary.

**Warner Adopts Profit Sharing Plan.**

Profit sharing with employees has been decided upon by the Warner Gear Co., of Muncie, Ind., in accordance with a plan long cherished by A. L. Johnson, the president. The board of directors has agreed to an annual distribution of profits by which the net earnings of the company will be shared by the employees in a graduated rate for one, two and three years' service, respectively, the three years rate being double the one year rate, and the two years rate intermediate. Approximately 200 men of the present force of 700 will share the present dividend distribution which amounts to about \$10,000 and is distinct from what is paid in wages and salaries.

**Accessory Jobbers to Meet Wednesday.**

The Motor Accessories Jobbers Association has decided to hold its general meeting on January 12, at 10 a. m., the Hotel Belmont, New York City, being the place selected for the gathering. The conference committee will hold its session with a committee of the Motor and Accessory Manufacturers, at the latter's New York headquarters, 17 West Forty-second street, on January 10, while the executive committee will hold its meeting on the following day at the Belmont.

**National Carbon Absorbs a Competitor.**

The National Carbon Co., Cleveland, O., has acquired the Eastern Carbon Works, of Jersey City, N. J., makers of the Eastern dry cells, and while the identity of the latter will be preserved, it will be operated under the direction of the National officials. The new arrangement becomes effective on the 15th inst.

**Dunn Back from Pacific Coast.**

H. T. Dunn, president of the Fisk Rubber Co., returned last week from a flying trip to the Pacific coast. He said he had no cause to complain of the results of his visit, and found the automobile trade on the coast full of optimism and good cheer.

# **SIMPLICITY—ACCESSIBILITY—ECONOMY**

are among the distinguishing features of the

# **White Gasoline Car**

The design of the White Gasoline Car is at least one year in advance of any other American machine. The White possesses all the desirable qualities to be found in other high grade cars and, in addition, it has certain advantageous features which are not yet embodied in the others. Among these features are simplicity, accessibility and economy.

- 1.—**SIMPLICITY.** There are fewer parts to the White than to any other car. Nothing essential has been omitted; well thought-out design has eliminated superfluous parts.
- 2.—**ACCESSIBILITY.** Any part can be reached without removing or disturbing any other part.
- 3.—**ECONOMY.** Low fuel consumption secured by the use of the "long stroke" engine, four-speed transmission and other refinements. Low cost of up-keep obtained because of simplicity and accessibility, and because the materials are the best ever put into a car of moderate price.

The White town cars are a revelation of luxury and refinement, combined with moderate cost.

### Overdoing the Popular Priced Car.

While the "big car" situation, which a year or two ago was a cause for concern, has pretty well settled itself, indications are not lacking that the so-called popular priced car is in danger, if not of being done to death at least of suffering grievous injury.

The faith of the men who are rushing into the manufacture of such cars is admirable, but unless they very considerably curtail their estimates and put more quality and less quantity into their efforts they are likely to reap harvests of barren regrets, to say nothing of the disappointment they will sow. A considerable portion of the public will buy anything "at a price," but it is not apt to buy the same article more than once when it falls short of claims and expectations. There are too many cars in prospect designed to appeal to this portion of the public, the extent of which is purely problematical, and reports from the Pacific coast serve as the first indication that they are

not moving and will not move as freely as their builders anticipated and anticipate will be the case.

There is a splendid selection of good "little cars" from which to choose, but the danger of a glut in the market caused by cars of the type built to "sell at a price," and which look the part, is such that even the established makers have cause for circumspection.

The automobile industry is no place for the "get rich quick" man. It is a serious business, full of pitfalls that will trap the unwary, and the newcomer who would remain and become a part of it had best build well rather than numerously.

### The Garage and the Chauffeur.

In these piping times of prosperity when everyone having anything to do with automobiles is supposed to be swimming in money, this advertisement in a New York paper has an odd sound:

Attention, Chauffeurs! Reward \$100.

Chauffeurs, owners or whosoever can influence the garaging of one or more automobiles we will reward with \$100, if the car remains in this garage for six months; we must fill up at once; we will take you for the first six months on your own terms; if our proposition does not fit your ideas, make your own terms; we must fill our immense modern garage.

While the anxiety of the owner of this "modern garage" and his public offer to "share" with the chauffeur is unusual, his announcement calls attention anew to the prevalence of that form of graft, which at one time was much discussed and vigorously aired. Although most chauffeurs are now rather circumspect in the manner in which they extend their palms, evidence is not lacking that they still are being quite generally "greased" and that the "rake-off" is as potent as ever it was, in the larger cities at any rate. The character of some of the places in which the practice prevails is the most remarkable part of the situation. Within the past week an instance of the sort came to our notice, the establishment being one that is well known and of good reputation and which is engaged in the sale of a high class car, as well as in the storage of such cars. Despite their good reputation, however, the owners are not above paying graft to chauffeurs. In one case, one of those worthies who is paid \$30 per week by his wealthy employer is also receiving \$5 per week for discreetly opposing the latter's inclination to transfer his two cars to a club garage, where graft is unknown. In this same reputable establishment a peep

into the boiler room disclosed eight chauffeurs engaged in a game of poker and about eighteen others "shooting craps."

Of course, man is not his brother's keeper nor the conservator of his morals, but for more or less direct promotion of vice and debasement of young manhood, the average garage-keeper in a large city has much to answer.

### Tire Inflation and Air Gauges.

Having brought their productions to that stage of perfection beyond which the improving hand cannot pass until undiscovered arts or materials shall have become available, it is not strange that some of the tire manufacturers now are lending themselves conspicuously to the prosecution of a campaign of education which ought to be unnecessary. For a campaign designed to teach users of pneumatic tires how properly to inflate them is calculated to bring smiles to the unthinking.

Of course, almost from the very beginning tire makers have laid more or less emphasis on the necessity for inflation of the sort and that the lesson remains so generally unlearned or unheeded at the end of ten years or more affords scope for striking commentary. To discover that the average tire is insufficiently inflated requires simply casual or every day observation. The tire in varying degrees of "softness" is so common that it scarcely excites remark; this is true, even of salesrooms in which high-priced automobiles are displayed or stored. Cars standing with tires "out of round," displayed on floors or in show windows, are numerous in evidence to bear witness that many of those whose very business requires they set a good example still are ignorant or indifferent.

That the bugaboos of tire trouble and tire costs largely are the products of underinflation does not admit of very much dispute and in laying more stress on this fact and in illustrating exactly how the lack of sufficient air in tires causes the trouble and increases the cost, the tire manufacturers are "following a lead" that is likely more effectively to produce the desired results.

There is no part of an automobile subjected to such great abuse as the tires, but hitherto insufficient inflation has not been generally recognized as an abuse within the accepted meaning of that term. But it is an abuse and the one which makes worse the abuses of actual use, which too seldom are attributed to the proper source. The

durability and the service rendered by a tire depends more on the manner in which it is used than is generally supposed and many otherwise careful users are prone to minimize the results of their carelessness by erring on the side of under-inflation. That it requires a sufficient amount of air just as the engine requires a sufficient amount of oil is or should be obvious. Both will perform service even when "starved," but it is not their best service, or service that adds to their longevity or that reduces the cost of their maintenance.

The campaign being conducted by the tire manufacturers should be supported and furthered by all who have to do with the production or sale of motor cars; it will redound to their advantage.

To avoid guess-work in the matter of inflation, the advice of that manufacturer who urges more general use of the air gauge is worth following. The gauge is an inexpensive little accessory of which more deserves to be known and of which very many more would be sold did dealers and garages but call it to the notice of their patrons. Its general sale and use would pay in more ways than one.

Madame Paladino certainly has nothing on the Motor Age. While that would-be sorceress may have called spirits from the vasty deep, our esteemed contemporary has proven itself able to call up and describe an automobile show held 1,000 miles distant long before the doors have opened or a single exhibit has been staged, and even was able to see and describe and picture things which no one saw after the show actually had been inaugurated, although he saw many things which it did not describe. Although it sadly mixed the tenses, Motor Age's alleged show number was as fine a bit of wand-waving as ever caused dollar bills to come from their hiding places. It was a splendid bit of catalog reviewing—so splendid that it is a pity it was marred by the designation "Show Number," even if that designation did give excuse for more than doubling the price. No good catalog reviewer should be ashamed of his work, and when he performs it so well it merits proper recognition and the right label.

Healthy and promising development is evident in the spirit of co-operation with which the various elements of the motor car industry are drawing together for reciprocal action and benefit. A broadened

## COMING EVENTS

January 8-15, New York City—Association of Licensed Automobile Manufacturers' tenth annual show in Madison Square Garden.

January 10, New York City—Conference committee meeting of the Motor Accessories Jobbers Association and the Motor and Accessory Manufacturers, at the latter's headquarters, 17 West Forty-second street.

January 11, New York City—Executive committee meeting of the Motor Accessories Jobbers Association at the Hotel Belmont.

January 12, New York City—General association meeting of the Motor Accessories Jobbers Association at the Hotel Belmont.

January 13, New York City—Second show meeting of the Society of Automobile Engineers at the Engineering Society's building, 25 West Thirty-ninth street. Dinner in the evening.

January 15-29, Philadelphia, Pa.—Automobile Trade Association's ninth annual show in Second Regiment armory.

January 17-22, Kansas City, Mo.—Motor Car Trade Association's show in Convention Hall.

January 24-29, Portland, Ore.—Portland Automobile Club and Dealers Association's show in Armory.

January 24-30, Washington, D. C.—Washington Automobile Dealers Association's fourth annual show in Convention Hall.

January 28-February 5, Edinburgh, Scotland—Scottish Motor Trade Association's annual show in Waverly Market.

January 29-February 5, Grand Forks, N. D.—Northwestern Implement Dealers' first annual automobile show.

February 4-6, New Orleans, La.—New Orleans Automobile Club's annual Mardi Gras speed carnival.

February 5-12, Chicago, Ill.—National Association of Automobile Manufacturers' ninth annual show in Coliseum.

February 14-19, Buffalo, N. Y.—Automobile Club of Buffalo's eighth annual show in Convention Hall.

February 14-19, Hartford, Conn.—Hartford Automobile Dealers Association's third annual show in Foot Guard Armory.

February 14-19, St. Louis, Mo.—St. Louis Automobile Dealers Association's annual show in First Regiment Armory.

February 19-26, Minneapolis, Minn.—Minneapolis Automobile Show Association's exhibition in National Guard Armory.

February 19-26, Newark, N. J.—Associated Automobile Clubs of New Jersey's show in Essex Armory.

February 19-26, Salt Lake City, Utah—Automobile show in Auditorium.

February 21-26, Binghamton, N. Y.—Automobile show in State Armory.

February 21-26, Cincinnati, O.—Automobile Club of Cincinnati's annual show in Music Hall.

February 21-27, Cleveland, O.—Cleveland Automobile Dealers Association's annual show in Central Armory.

February 22-27, Milwaukee, Wis.—Milwaukee Automobile Club's second annual show in Auditorium.

February 24-March 3, Toronto, Can.—Ontario Motor League's show in St. Lawrence Arena.

February 28-March 4, Omaha, Neb.—Omaha and Council Bluffs Automobile Dealers' show.

February 28-March 5, Kansas City, Mo.—Kansas City Automobile Dealers Association's fourth annual show in Convention Hall.

March 5-12, Boston, Mass.—Boston Automobile Dealers Association's eighth annual show in Mechanics Building.

March 12-19, Syracuse, N. Y.—Syracuse Automobile Dealers Association's annual show in State Armory.

March 21-28, Denver, Col.—Denver Motor Club's annual show, in Convention Hall.

March 26-April 2, Montreal, Can.—Fourth National Automobile and Sportsmen's show.

outlook has enabled each of the separate divisions of the manufacturing and merchandising branches to organize themselves to a greater or less degree into larger units for handling problems affecting their common good. A further extension of the principle is dawning in the communication and commerce of these organizations with one another, in relation to large trade matters involving their mutual interests. In the same sense that individual liberty and prosperity is best conserved by an organized commonwealth, the affair of the preponderating proportion of persons and

companies in the automobile industry will best thrive through the knowledge and action which intelligent and broad minded co-operation makes possible.

Sometimes it is necessary to go to Philadelphia to obtain news. A paper published in that city, which claims to be devoted to the interests of the automobile industry, is circularizing automobilists, informing them, among other things, that "the aeroplane is already as safe as the automobile," which necessary and timely assurance should cause a rush for aircraft.

## The Palace Show and What It Holds

THE FIRST VIEW OF THE SHOW FROM THE ENTRYWAY

Perhaps it was a trellis garden "effect" which the decorative experts planned for the American Motor Car Manufacturers'

Association's show, which now occupies Grand Central Palace, New York; their advance designs certainly made it so appear,

but between the designing and the fulfillment someone or something must have slipped and spilled a considerable portion

of the "effectiveness"; for as a matter of fact, it is only by closing all of one eye and most of the other, and breathing deeply, that the imaginative spectator entering the Palace is able to fancy himself transported to a trellis garden.

Reality does not very well match the advance pictures or preconceived notions; and yet the show and its "dressing" does not suffer because of the fact. The trellis garden idea suggested the theatrical or the strikingly spectacular, whereas the lattice work treatment of the Palace is striking in its simplicity and probably it is more effective because of this simplicity. Of course, if lattice work constitutes a trellis garden, Grand Central Palace just now is several varieties of such garden; the checkerboard effect is everywhere; the railings, the many pillars, the sign-posts and many of the walls all are hidden by lattice work; the roof of the central court is hidden by a canopy similarly treated and on which leaves suggestive of a garden are artistically scattered. It is a green and white show—green lattice work on a white ground. Where there is no lattice work, there is either green bunting or monochrome impressionistic paintings, the monochrome being green also. There are no flags or flowers; no festoonery or statuary. The only thing suggestive of the latter is the white fountain playing in front of the huge, lattice framed mirror, in the central court, which mirror and which frame lend to the court that appearance of "depth" which it does not possess and which so greatly "helps."

The whole effect is one of simplicity—one more in keeping with the character of the exhibition and one which causes wonder that the more theatric "properties" of previous years ever were employed.

The show formally was opened Friday evening—New Year's eve—by the Hon. Patrick F. McGowan, president of New York's board of aldermen, who delivered himself of some statistics pertaining to the industry with which he had been charged and who dropped his title and his office a few hours later. Opening night always largely is "paper night" and, of course, a big crowd was in attendance, but it was not so large as on similar occasions of previous years, and if the whole truth be told, the attendance on the succeeding days and nights plainly has shown a falling off; there has been no marked congestion in the aisles or around the exhibits and it therefore has been possible to traverse the big, many-angled building, and to "see things" with a degree of comfort and without fear of having one's clothes torn off his back or his pet corn trampled upon. There is a large trade representation present, however, and more agents are expected to-day and to-morrow. Most of those who already had not "signed up" for the new year have been "shopping" or "looking around" before closing contracts and as a result the transaction of no great volume of business is reported; to-day and to-morrow, when the show

closes, are expected to prove the real business days, although there are exhibitors of cars who came to the show "sold up" or so nearly sold up that they are exhibiting largely as a matter of form.

The Premier to the left, and the Reo to the right, are the two exhibits which first meet the eye on entering the main hall. There are eight of these central exhibits and as they occupy generous spaces the first effect is pleasing and is "doubled" by the reflections in the great mirror. The exhibits which share pride of place with the Premier and Reo are the Mitchell, Brush, Stoddard-Dayton, Ford, Panhard and C. G. V. These are flanked on four sides by a

number of other well known cars, among them the Jackson, Maxwell, Lambert, National, Marmon, Pullman and Hupmobile. The newer cars and the commercial vehicles are staged on the floors overhead.

The simplification of the decorative scheme is not the only indication of the changing character of the show. This also is observable in the comparative fewness of what may be called purely "show" cars and "show" chassis. Of the latter there are but two specimens, the Jackson and the Inter-State, both highly finished and Damascened or "mottled." Of "show" cars there also are but two, the American Simplex and the Black-Crow. Both are of the so-called honeymoon type, that is, finished in white with gold striping and with upholstery to match. The Simplex is festooned with ropes of flowers while on the top of the Black-Crow (which is the compounding of two family names) is perched a cupid which, with ribbon reins, is driving a black crow mounted on the radiator. Most

of the "action" is as unusually, contributed by the accessory exhibits, where literally sparks fly, that is, wherever there is a battery, or magneto or other ignition device being demonstrated, but even the snap and flame of the sparks and the movement of the speed indicators appear to hold less attraction than formerly for show goers; such displays did not appear to attract or to "hold" them in such numbers as in former years. The demonstration of Jones's "live map" probably is the center of the most curiosity and real interest; it scarcely requires the services of the negro who, wearing a uniform on which is printed a map of the United States, is employed to give point to the "live map" idea and incidentally to distribute circulars.

While many things connected with the show give evidence of changed or changing conditions, the incompetent or uninformed salesman or attendant remains a numerous attachment or incident of the automobile exhibits; for to their credit be it said, the men in charge of the accessory booths know their goods and know how to explain them and intelligently to answer inquiries. At too many of the automobile displays, however, there are in evidence the young men who, immediately more than general information is sought, express anxiety to have the inquirer "call again when Mr. — will be here." One member of this tribe when asked what changes had been made or what improvements had been effected in the car he was trying to sell, promptly was "stumped," and remarked anxiously that a reading of the catalog would impart the information.

"But that hardly will specify the changes between this year's model and last year's," was suggested.

"Then get one of last year's catalogs and compare them with this one," replied the prize salesman.

"Where can I get one of the old catalogs?"

"Maybe our agent uptown can find one for you."

This may sound like overdrawn fiction, but it really is very much underdrawn fact.

There also occurred another incident which serves to show the novel manner and extent to which salesmanship now is being prosecuted. The show-goer was busily intent on inspecting a particular car when he was approached by one of the attendants.

"Are you interested in the purchase of a car?" politely inquired the salesman. Promptly, undecieved as to the mission of the visitor, the salesman smilingly and in a half-apologetic tone remarked:

"I really thought you were a 'prospect' I've been expecting. You fit his description; in fact, our Philadelphia agent sent me his photograph and you look so much like it that I thought you were the man."

The idea of fortifying salesmen with photographs of prospective purchasers is startlingly novel, even though the shows themselves are growing old.

GENERAL VIEW OF THE CENTRAL COURT IN THE GRAND CENTRAL PALACE SHOW

## Cars Making Their Debut at the Show and Their Features.

Throughout the ten brief years of American automobile show history, pride of place has been accorded to the new cars on view. The number of such offerings fluctuates

from year to year. This year, the number of debutantes at the Palace is greater by four than the aggregation of one year ago, counting only the newly arrived pleasure vehicles. There are 15 newcomers all told, seven of which are newest of the new, in that they never have been exhibited publicly before. The remainder may be said to be new, in the sense that they have not before been exhibited at any New York show, and that they are cars of only recent introduction to the public.

In pianos, houses and lots, beds and books, masterly salesmanship long has thrived on an intricate though seemingly

elementary system of merchandizing known as the instalment plan. Many persons, doubtless have experienced an inclination to apply the same project to the distribu-

tion of automobiles at retail. But one vital objection prevailed against all early plans for putting the scheme into effect. Whereas, an instalment piano is fairly likely to remain in the front room until paid for—that is to say, making a few generous allowances for fires, strikes and acts of Providence—the purchaser of an instalment motor car might be considered something of a risk, in that, if of dishonest proclivities, he might make use of the portability of the machine in side-stepping the final issue. He also might smash the mortgaged car. Such objections to an otherwise acceptable and profitable project, however, were en-

tirely swept away with the conception of the Metz plan.

By the Metz plan, not only the purchase

GENERAL VIEW OF THE "UPSTAIRS" DISPLAY AND DECORATION

but the sale is made in instalments. That is to say, the buyer receives small portions of the car, neatly wrapped and labeled, in return for each advance made on the total purchase price of the vehicle. Directions supplied with the parcels enable him to become his own assembler, thus adding to the interest of the scheme in many quarters, while helping to reduce the cost to moderate proportions. An interesting proposition enabling dealers to assemble the machines for purposes of retail sale, also adds to the attractiveness of the system.

Although this plan has been working successfully for almost a year, the Metz car

has not before been exhibited in New York. Being a distinctive product, it is shown mounted on horses, thereby enabling the curious to twirl the wheels, asking questions as to its construction. A naked chassis in the rear of the booth also permits its mechanical features to be examined directly.

An opposed motor of  $3\frac{1}{2}$  by 3.3 inches cylinder dimensions, and rated at 12 horsepower, is placed cross-wise in the frame, in front. Magneto ignition, and a simple oiling device with a gravity sight-feed leading to each of the cylinders from the dash, complete the auxiliaries. Transmission is by a double disc friction system, drive from the fly wheel to the first disc being accomplished by means of a line shaft, with a flexible driving connection at the fly wheel which takes the place of a universal joint in the shaft. From the counter shaft to the rear wheels, drive is by side chains. Several novel and original devices are exhibited in the little machine, which, by the way, weighs but 650 pounds, among them being the emergency brakes. For braking purposes, the equivalent of a multiple disc clutch is mounted on each of the rear wheels. The discs are not large in diameter; but what they lack in individual surface is made up in numbers, and a most effective braking device is thus secured by simple means. Wire wheels are a stock feature, with good wood ones as an option.

Next larger than the Metz, but still a long way from rivalry with the "speed monsters" to be seen on the lower floor of the show, the Demotcar, another innovation, is displayed in all the glory of top, wind shield and generally elaborate equipment for so small a machine. Investigation reveals the fact that several of the more ornamental and less essential features are optional. This does not in the least detract from their value in "setting off" the lines of the vehicle itself, however, and to tell the truth, it presents a very prepossessing exterior indeed. A peep beneath the bonnet in front, however, discloses considerable unutilized space, and a diminutive opposed motor, which, because it is not only small, but set very low in the frame, produces an impression of inadequacy, which road experience with the car is said to dispel completely.

The cylinders are  $3\frac{3}{4}$  by  $3\frac{1}{2}$  inches, bore and stroke, and the rated output 8-10 horsepower. Magneto ignition is one of the boasted stock features of the machine, while a neat and compact form of unit power plant is used, housing the planetary change gear. Transmission is by double pointed cardan shaft, and the rear axle is modeled closely after a standard type employed in large car practice. Gear control is selective, and the arrangement is such that the single side lever also controls the emergency brakes, which are expanding in form, and mounted on the rear hubs. Service brakes also are provided, similarly mounted

on the hubs. They are controlled by foot pedal.

Novel, in being the only one of them to mount a two-cycle motor, the Paige-Detroit

is a third addition to the ranks of the new cars which are low in price and built with the definite intention of catering to the demand of economical motor car service. It is put up in neat form, as a racing runabout, that is to say, with a two-passenger body, behind which is mounted the gasolene tank.

Long mud guards, ample hood dimensions, and a hooded dash, serve to add considerable dignity to its outward appearance. The motor is of the three-cylinder vertical, three-port type. Its construction embodies no particularly radical departures from two-cycle precedent, but the assertion is confidently made that the proportion and position of the ports has been correctly achieved, which, as everyone knows, is the whole secret in the design of engines of this type. One point about the engine which is especially noteworthy, is the construction of the screens which are placed in the transfer ports. For convenience in cleaning and replacement, the gauze portion of the device is reduced to a simple sheet of fine screen wire, which is rolled up and slipped into a perforated copper cone, while a second cone correspondingly perforated, afterward is slid into the rolled screen, expanding it into contact with the first cone. Flanges on the large ends of the two cones enable them to be clamped in position beneath a screw cap, which is readily removed.

The flywheel, which is mounted on the forward end of the crank shaft, enables the unit power plant construction to be simplified, while necessary driving power is secured in the relatively small diameter clutch by the use of considerable width of face. Two speed selective gearset of the sliding type, shaft drive, expanding and contracting brakes, thermo-syphon cooling and magneto ignition, are up-to-date features offered. The horsepower rating is 25, on a  $3\frac{3}{4}$  by 4 inch cylinder basis.

Introducing an original form of block motor, not to mention a pressed steel chain housing which also serves as a distance rod for the final driving chains, the Empire, is a small car of several ingenious, and one or two surprising features. For example, the motor construction is such that the cylinder heads, valve pockets and water jacket tops are all closed by means of a single plate, which is held in place by means of 16 bolts, uniformly distributed over the perfectly flat top of the engine in such a way as to resist all possible strain. This makes tinkering with the valves a by no means convenient pastime, nor one easy of accomplishment. At the same time, the arrangement possesses the advantage that once the cover plate is removed, not only all the valves, but the piston heads and cylinder interiors as well are exposed, so that, for purposes of general overhauling, the scheme may be said to be essentially convenient.

The leather-faced cone clutch in the fly wheel is completely enclosed in an extension of the engine base, while the primary driving shaft is encased in a tube which extends well to the rear of the chassis and is joined rigidly to the gear box. The latter encloses a two speed, selectively actuated sliding gearset, which is arranged with the lay shaft parallel to the counter-shaft, and therefore lying transversely of the car. With the differential gearing, the

entire aggregation from the motor backward, is rigidly mounted in the frame. The driving chains, as already explained, are encased in rigid cases, which have a radial action about the axle, and which are flooded with oil. The machine is assembled in two models, differing principally in body mounting and wheel base, one being of the racing type, and the other of more conservative pattern. Magneto equipment is a standard feature, as is battery ignition as a standby. For a low priced machine of 20 horsepower rating, this is an unusual and commendable feature.

Much more familiar to the average showgoer, by reason of the fact that it has been on the market nearly a year, although never before displayed in the Palace, the Hupmobile is one of the most ingeniously designed of the small new cars. Designed primarily as a light speed car its four cylinder castings, unit type of power plant housing a neat two-speed selective gearset, shaft drive and other features, are especially well worked out. The propeller shaft is of the single jointed pattern, with the forward end of the enclosing torque tube supported in a universal joint on the rear of the gear box. Two diagonal struts, which preserve the alignment of the axle, instead of being jointed to the tube itself, as frequently is done with arrangements of this sort, are carried in independent sockets on either side of the principal universal, and also on the gear box.

Of larger machines, ranging around 30 horsepower, several are in the Palace. Perhaps the most discussed car in advance of the show, was the Everitt "30", of which great things were expected because of its prototype in the widely known E-M-F., two of the original producers of which now are allied in the production of the Everitt. Nor is it in any sense of the word a disappointment. Such features as its block motor, axle-mounted selective sliding gearset, double drop frame, and liberal spring mounting are drawn from the most widely sanctioned and modern practice.

The 4 by  $4\frac{3}{4}$  inch motor displays a most ingenious main casting, which includes in addition to the cylinders, valve pockets and intake and exhaust manifolds, the upper half of the crank case, the crank shaft bearings and the inner half of the housing for the timing gears in front. It is provided with the simplest form of lubricator imaginable, consisting only of a closed tank mounted on the right side of the cylinder casting, over the carburetter, and fitted with a single outlet in the base, running into the crank case, and equipped with a steel ball check.

Visitors who inquire how the vacuum system works, are referred to the neighboring drinking fountain which mounts an inverted bottle, said to deliver up its contents to the thirsting ones in just the same way. After meditatively sampling the contents of

the water bottle and returning to the chassis, non-plussed, the further explanation is given, that under normal conditions, the lower end of the pipe leading from the oil tank to the crank case, is sealed by the oil in the case. Therefore, as no air can en-

EVERITT "30" TRANSMISSION AXLE

ter the tank, no oil can leave it. When the level becomes too low, the end of the pipe is uncovered, air rushes in, and a sufficient amount of oil is delivered to the case to raise the level to the proper point.

The rear axle construction is strong and neat, and original in several respects. The outer housing is made in three separate castings only, one housing the change gears, the second enclosing the differential, mounting the rear end of the change gear shafts, and forming one-half of the axle housing proper, and the third completing the axle structure. The remainder of the axle, of course, is of plain tubular construction. A novel feature of the arrangement is that the brake rocker shafts, for the double expanding and contracting brakes, are mounted well in front of the axle, with the rockers and connecting rods well inside the frame. The ends of the rocker shafts are carried in the gear box, thus being afforded a simple and strong support.

So new that most of the show visitors readily plead ignorance of its very exist-

OTTO TORQUE TUBE MOUNTING

ance, yet produced by an experienced designer and an old engine building concern, the Otto, represents more than a year's

steady effort, it is claimed. It is equipped with a 35 horsepower motor of  $4\frac{3}{4}$  by  $5\frac{1}{4}$  inches bore and stroke; has the axle-mounted style of change gear, and a leather-faced cone clutch. Both in chassis and body design, its lines are pleasing and workmanlike, and for a machine of generally standard features, it reveals many distinctive qualities which promise well for its serviceability.

Special details which are noteworthy, are the method of mounting the clutch, which is so arranged that the engaging spring is completely housed, while the driving strain is taken up on the squared transmission shaft; the neat design of the rear axle, and the method of mounting the forward end of the torsion tube and the single universal joint which is introduced into the transmission line. The cross frame member which supports the very important universals of the torque tube and propeller shaft, is reinforced by means of a heavy vertical plate, extending entirely across the frame. Attached to this are the trunion bearings of the floating ring which forms the hook's joint by which the torsion tube is suspended, and which supplants the ball and socket construction which is found on so many cars.

The Fal car, another of the new ones, though not old enough to have weathered a previous show season, already has run through a first model, and now appears in slightly revised form, though not materially altered from the original concept of its builders. A well-built motor of 35-40 horsepower, multiple jet carburetter, forced lubrication through the hollow crank shaft, with overflow returned to the engine base; and dual ignition, are important points in its make-up. A wide faced cone clutch, selectively actuated gearset, and shaft drive, complete the essentials of the power plant.

Unquestionably the most pretentious of the new cars is the Speedwell, which, though not previously exhibited at a Palace show, is already well known, and has seen several years of actual service in the hands of the user. It is of 50 horsepower rating, original in several particulars of its design, and solidly built throughout. Specific mention may be made of the method of arching the frame over the rear axle in order to gain adequate clearance for spring action, and of the use of Timken bearing equipment for the wheels and change gear mounting. The use of a special feeding chamber for the carburetter, so placed as to afford a uniform supply regardless of grade inclination, is an exclusive feature.

A new car which has many points to recommend it is the Cole "30," which comes on the scene with a unit power plant, 4 by 4 inch cylinders, cone clutch, selective gearset and propeller drive with single universal construction. The gearset, including the clutch housing, is suspended from the

EVERITT "30" TOURING CAR

EVERITT "30" WITH TOY TONNEAU

engine base, the latter being carried on four points, and the entire load of the torsion tube is borne by the rear bearing of the transmission.

The Staver, product of a carriage building concern of many years standing, is directly successor to a light vehicle built for either solid or pneumatic tire service; that, in turn, being an outcome of several years endeavor in the high wheeled buggy field. The new car, however, reveals no traces of the abandoned carriage practice, but is thoroughly conventional in every respect, solidly constructed, and embodies many standard parts. It is of the 30 horsepower class, has selective change gear with multiple disc clutch, dual ignition and other modern refinements.

Founded on an entirely new corporation basis, but with a designer of well seasoned experience, the Klinekar possesses several features of noteworthy merit. In both 4-24 and 6-40 models the cylinders are cast separately, but are tied together, forming much the same effect as is obtained with the block method of casting, in that the water jacket runs the entire length of the battery. Each cylinder is cast with large open cored openings on either side of the jacket, the openings being flanged outwardly to form abutting faces. After being assembled, the series is tied together by through bolts, which reach from end to end forming a rigid construction. The other ends of the front and rear cylinders are closed by special cast plates, that in the rear carrying a

connection for the cooling water outlet, while it also is equipped with radiating flanges.

KLINE-KAR WATER OUTLET

Another original feature, is the method of heating the intake manifold on the six cylinder motor, to prevent recondensation of the gas. The manifold is of the triple

KLINE-KAR WATER JACKETED MANIFOLD

fork pattern, with closed loop inserted for the purpose of distributing the gas uniformly to all the cylinders. It is the horizontal section of this loop which occa-

sionally gives trouble in service. In the present instance, it is boxed in by means of cover plates, the entire enclosure thus forming a jacket, into which hot water from the cylinder jackets is introduced by means of a by-pass from the carburettor jacket.

In nearly all other respects the line is of standard form and build, though well proportioned and assembled in a clean manner. A variety of body and chassis combinations are offered, the most pleasing in many respects being the small runabout, which is a remarkably good looking affair, price and power taken into consideration.

Another carriage building concern which has produced a good looking product for which strong claims are made as to quality, and in which no experimental features have been introduced, is the Patterson. Like so many others at the show, it is of 30 horsepower rating. It has the unit type power plant, with three-speed selective gear-set, cone clutch, double jointed shaft drive, thermo-syphon cooling, and dual ignition. Although the first cars were produced early last summer, the vehicle now is exhibited for the first time, and with the same chassis, is presented in three several styles of body mounting. More familiar in the middle west than in the East, the Halladay makes its first invasion of a New York show at this time. The 30 horsepower model is new this year, though not differing materially in design from either of the other models produced by its builders. The larger model, which is of 40 horsepower capacity, like the 28 model, has been en-

EMPIRE "20" MODEL B

PAIGE-DETROIT ROADSTER

KLINE-KAR SIX CYLINDER MODEL

MITCHELL SIX CYLINDER TOURING CAR

larged as to wheel base, body sizes and tire specifications, in the course of preparation for the new year.

The Ohio is a car which reveals several exclusive features, though no untried principles are applied in its construction. The unit type of power plant is used, while the method of mounting the forward end of the heavy torsion tube is noteworthy. The rear end of the gear box, which otherwise is made of cast aluminum, uniform with the engine base, is of cast steel. It is shaped to form the female member of an immense ball and socket joint, which supports the forward end of the torsion member. The power plant is supported on three points, one on either side, at the rear of the engine. The pressed steel torsion member is unusually long, thus reducing the angular working of the joints to a minimum, while the selective gearset is reduced to small longitudinal dimensions, rendering the assemblage as a whole entirely characteristic.

#### NEW MODELS FROM OLD MAKERS.

Fine opportunity for nice distinction is offered in the "new models" presented by the established manufacturers. In some instances the adjective new, is applied merely as a matter of nomenclature, the vehicle itself actually showing few points of difference from previous machines of the same general class. In others, totally new cars have been developed. The Jackson, Maxwell, Pullman and National stands are among those on which are shown new cars which follow pretty closely the standard practice of the respective manufacturers.

The Jackson "30," which is the novelty

in that particular line, has the unit power plant and valve-in-the-head motor, which is now universal on all models. Inclined valve chambers in the heads, afford ready means of mounting the cam shaft over the tops of the cylinders and of actuating the valves by means of short and neat rocking tappets. In the new car, a slight divergence is introduced in the method of actuat-

BRUSH RUNABOUT

ing the cam shaft. Instead of a vertical shaft in front of the cylinders, with bevel driving gears, the timing gear is actuated from the rear of the motor, a chain and sprocket mechanism, completely housed, serving the purpose effectively, and permitting a most compact arrangement of the motor.

In practically all respects, the new Maxwell Model "O," which is produced with a variety of body equipments, including the "Sportsman," is essentially the same in unit power plant and other respects, as the older members of the line. It has the three-quarter elliptic rear suspension, and the new oiling system, which has been adopted for the entire line, and is essentially a remarkable product, price considered.

The new 28 horse power Pullman, while in many respects in close harmony with the remainder of its line, has a slightly different appearing motor, the effect being due to the method of casting the cylinders in pairs. As is well known, casting the cylinders individually with water jackets open on the ends, and bolting the group together in block style, has been a Pullman characteristic. It is retained in the other sizes of engine. The new model also possesses a number of cleanly designed features which add to the impression of its mechanical aptitude.

The new National is an exemplification of the sort of industrial progress which permits manufacturing economies, such that a large and pretentious looking car can be marketed at a figure formerly applicable only to machines of much lower grade. The characteristic T-head cylinder construction, cone clutch, selective gearset, and, as a matter of course, shaft driven, are among its outstanding features.

The new four-cylinder Reo, which is the first quadruple engined successor to the little twin cylinder car which has been such a successful product, is more than an average achievement in its class, judged on the basis of design alone. It is distinguished by the left-hand arrangement of the control, which still is a conspicuous feature despite the gradual increase in the number of makers applying it. As revealed by a sectioned moving model, the motor has inlet valves in the head and exhausts in offset pockets on the right; crank case lubrication, with plunger pump to ensure circulation; dual ignition, with low tension magneto; and multiple disc clutch, with universal connection to the selective gearset, which is

COLE "30" TOURING CAR

REGAL "30" TOURING CAR

MARMON "THIRTY-TWO" IN RUNABOUT AND CLOSE-COUPLED FORMS.

mounted in the waist from sub-frame support. Every line of the design reveals modern tendencies, though few radical departures. One possible exception is the steering gear, which is of the bevel gear and sector type, and which is left entirely unenclosed.

While the entire Mitchell line is new this year insofar as the design of the cars themselves is concerned, attention naturally centers about the \$2,000 six-cylinder model, which is one of several examples of close

tion for the propeller shaft housing, and an unusually sturdy method of mounting and articulating the forward of the tube on the central cross frame member.

The Pierce, another new car, is in much the same class, though radically different in construction, having the centrally mounted gear box, multiple disc clutch, and other standard features. Although directly a successor to the Pierce-Racine of former show exhibits, it is practically a new car from the ground up, and is produced by a reor-

type of vehicle, the extensive McIntyre product has now been standardized so far as visible features indicate. The 30 horse power model has such impressive specifications as selective gearset, 112-inch wheel base, full elliptic rear springs and 36 by 3½-inch tires.

Another graduate from the high-wheeled persuasion of former shows is the Black Crow. The white Black Crow, being presented to view directly on the front of the stand, the visitor is led around to the rear

PREMIER "4-40" ROADSTER.

MARMON ROADSTER WITH ROUND TANK.

calculation in production and high-grade construction, which the show acords. Coming in the six-cylinder class, however, it is somewhat out of the ordinary in this respect. It has 4½ by 5-inch cylinders, cast in pairs, selective gearset, 130-inch wheel base and 36 by 4½-inch tires. Technically, it possesses several ingenious and effective details.

The new Moon, another of the 30 horse power class, is of solid construction, possessing the rather uncommon band clutch, which is a distinctive feature; axle mounted change gear with torsion tube construc-

ganized and rejuvenated company of recent organization.

More or less prominent by reason of its Renault type hood and radiator, the newest Mora, which is of 20 horse power, is of the runabout order, designed for two passenger service of the modest and conservative order. The motor is quadruple, with cylinders cast in pairs and measuring 3¼ by 3½ inches. Expanding clutch, two-speed progressive change gear and three-quarter platform suspension behind, are its leading features.

Formerly produced only in the buggy

if he wishes to inspect the vital mechanisms intended for its propulsion. The motor is rated at 25 horse power. Axle mounted change gear and full elliptic rear suspension constitute the main "talking points"; it being explained that the machine is so thoroughly standardized that its specifications are the only points about it which need to be discussed in any way.

The Schacht, which also formerly was made in high-wheeled form, likewise is presented as an entirely new vehicle. It is made in several styles, the basic chassis details being practically the same in each case,

MARMON "THIRTY-TWO" FIVE-PASSENGER TOURING CAR.

NATIONAL "60" SIX-CYLINDER TOURING CAR

NATIONAL "40" FOUR-CYLINDER TOURING CAR

however. Original and unusual ideas are displayed in the arrangement of the power plant. The motor, which is of the double-opposed pattern, is placed under the hood in front, but fore and aft of the car, instead of transversely, as in the common rule with this type of motor. Transmission to the countershaft, well in the rear, is accomplished by means of a driving chain and sprockets. The clutch is of the "dishpan" type, which is to say that it is a combined cone and disc, the conical rim engaging first and softening the action of engagement. The driven sprocket is mounted on a sleeve loosely carried on the differential counter shaft. The sleeve itself constitutes the driving end of the planetary gearset, the inner shafts transmitting the final drive to the rear wheels through side chains. An unexpected though necessary feature of the forward section of the transmission is the rubber-covered idler, which prevents the chain from whipping and ensures constant working conditions. Although only with pneumatic equipment, solid tires are an option, said to be in considerable demand.

With one entirely new model, in addition to the considerably modified 30 horsepower car of last year, the Firestone-Columbus now appears in a particularly neat little 24 horsepower chassis, which is made either with left or right-hand control, the levers being placed outside the car in either case; and which is offered in a wide variety of body styles. The same selective sliding gearset and cone clutch are used on both types of car, but otherwise they are distinctive. The smaller, which is shown in torpedo runabout form, has a floating axle construction, embodying the use of duplex ball

bearings in such a way that, even with the effect of the usual hub cap drive, obtained

SCHACHT IDLER.

by a special form of clutch, the hubs are of small size and short length. The rear

BRUSH TRANSMISSION.

axle on this chassis also is equipped with an original form of shock absorber, which the

untutored visitor is apt to mistake for some sort of brake. When he has been set right on this point, he is made to understand that the location of the two drums, one on either side of the differential housing, is to resist the plunging of the chassis directly under the load, instead of at either side of it, while the big drums, pinch straps surrounding them, and levers linked to the under side of the body, are contrived to provide easy and adjustable resistance to shock, without necessitating repeated and frequent tinkering, or excessive wear. Several ingenious minor details are worked out on both cars, as in the mounting of the clutch throw-out yoke without the use of independent brackets bolted to the frame. The larger machine is equipped with a particularly strong and impressive looking axle equipment, which is one of its new features at this time.

Among the cars which, while exhibiting relatively few alterations, yet are known by new model designations, is the little Brush. Appearing for the first time with an extended line of body equipments, this peculiarly attractive little machine remains mechanically about as first designed. One new feature added at this time, which is of considerable importance, particularly in a single cylinder machine, is the addition of an extra balancing counterweight on a special shaft which is housed in the crank case. The device is the same as was applied a couple of years ago to a twin cylinder model, now obsolete. The crank shaft is counterweighted to balance the "beat" of the piston and a part of the connecting rod, as well as the vertical oscillation due to the crank itself. The extra balance weight is introduced for the purpose of overcoming

BLACK CROW MODEL "C."

MAXWELL MODEL "Q" SPORTSMAN.

the effect of the crank balance in a horizontal plane, and is not only highly scientific but practical as well. The transmission mechanism of these cars, like the helical spring mounting, all wood frame and axles and many other features, is notably ingenious. The housing for the planetary change gear, differential and countershaft, is in a neat casing, suggestive in a general way of the conventional rear axle mounted gearset. The change gear now has disc clutches for the low and reverse speeds, in

the crank shaft will be revolved through a sufficient arc to throw one of the pistons over the compression and firing point. Successive thrusts on the pedal, of course, permit any desired number of impulses of this sort to be given to the shaft.

That the device possesses an added feature of interest, is demonstrated to the skeptical by any willing demonstrator on the stand, who is able to prove that by the exercise of proper muscular effort and patience, it is possible to propel the car by

viously of original design throughout. Its two-cycle, four-cylinder motor, with cylinders of 5 by 5 inches dimensions, cast in pairs, so far as is known, is the largest two-cycle automobile motor now on the market, as well as one of the most striking and most successful.

The substitution of a selective gearset for the progressive system which has been used hitherto, constitutes the principle alteration in the Gaeth. The new gear-box, it may be mentioned, is so designed that its cover plate, which is inclined toward the left side of the car, may be removed, and the gears inspected, without removing the body. Midlands now are equipped with a unit power plant of new design, together with a three-plate, all-metal clutch, which includes a long torsion tube. The unit power plant of the Moline is retained, along with other characteristic features, as is the rear axle transmission system which is peculiar to the Regal.

New Premier models have longer stroke motors, longer wheel bases and sundry refinements of a minor nature. The method of supporting the motor and gear box on the sub-frame, is distinctive, the sub-frame being virtually a reinforcing plate applied to the side frame member. At its rear end, where the gearset is mounted, it is separated from the frame, but in front, it is brought close to the side member, and bent down and to one side to form a stay for the saddle on which the radiator is carried.

Continued application of the under-slung frame principle on the American, appears to be a matter of unquestioned assurance. The unusual form of the car entails end-

STODDARD-DAYTON "10-K" TOURING CAR.

addition to the high; the selective control mechanism has been revised; a universal coupling has been added to the transmission; an improved commutator installed, and the wheel base lengthened six inches.

Stoddard-Dayton cars, uniform in design throughout the three chassis sizes produced, have a redesigned motor now, with single rocking levers for operating both sets of valves, which, as before, are mounted in the head. The arrangement of the cylinders has been altered, changing the position of some of the auxiliaries, and otherwise improving the power plant. The gasoline tank now is hung in the rear of the chassis, bringing it entirely clear of any possible contact with the rear axle, while the cylindrical tank form with convex ends, has been adopted.

Such cars as the Marmon and the Glide reveal but few alterations. The former has a little longer stroke and a little longer wheel base than formerly, and otherwise is improved in a few minor respects. Its characteristic lubricating system, rear axle change gear and other features, however, are retained. The Glide has a new cut-under body design, drop sill frame, which lowers the body about 3 inches; larger tires, and, in the case of the roadster, longer wheel base.

Exclusive in exhibiting the only pedal motor starting device in the show, the now crankless Lambert is an object of considerable interest to the mechanically inclined. The motor starter, which is a clutch-lever device taking hold of a flange on the front side of the driving disc of the friction transmission, is so contrived that a release dog is tripped in the event of a back-fire from the motor. In operation, it is necessary merely to press forward on the pedal, when

foot power alone. This is done merely by engaging the friction drive and opening the engine petcocks, when little jabs at the pedal suffice to inch the car along the stand and out into the aisle. This exercise is not recommended for people with weak ankles or those who desire to exceed the speed limit.

Full elliptic springs now are employed on

JACKSON "40" TOURING CAR.

the standard chassis, which has otherwise been improved in a number of minor points affecting the transmission and control mechanism. In addition to this, the latest models are equipped with a new form of block motor, which has several interesting characteristics.

Among the cars of stable characteristics, in a general way are the Ford, Pennsylvania and the American Simplex. The latter vehicle, making its second appearance at the Palace this year, is of impressively solid and workmanlike construction, and ob-

less surprise among visitors who are experiencing their first show, but the structural details of the machine are such as to give every assurance that its arrangement is not the result of a mistake on the assembling floor, as some might suppose. Another car which is a trifle out of the ordinary in one or two particulars is the Atlas, which is now produced in three and four-cylinder form, and in outward proportions which annually grow more imposing. Its two-cycle motor is a promising member of that limited class.

SIDE AND FRONT VIEWS OF HUPMOBILE ROADSTER.

Universal joints on all connecting linkages, are a feature of the Coates-Goshen, as are also its rather unusual form of torque resisting mechanism and the double drop frame. Now produced in two models, which differ mainly in horsepower and wheel base, the larger of the two is driven by a 45 horsepower motor of original construction, which is entirely new this year. A new motor installed in the smaller of the Crawford models, brings its power rating up to 28 horsepower. Otherwise there are few material alterations in its construction. The larger model has been changed only to the extent of fitting a new set of special springs, and enlarging the body to unusually large dimensions, as a result of which it is made of eight-passenger carrying capacity; an extra seat being adapted to fit in between the two forward tonneau chairs on occasion.

A slight alteration in the construction of the valve enclosing piping on the inlet side, making for great convenience in repair work; a new engine oiling system; and enlarged truss rods on the rear axle system, constitute about the only modifications to the Cameron line. The Middleby is reproduced exactly from last year. Kisselkars have longer wheel bases, new brakes, lower frames, larger wheels and more roomy bodies. These are the more important alterations of a general nature. In addition to

this the motor sizes have been increased, and a four-speed gearset with direct drive on the third speed has been adopted.

The characteristic arrangement of the torsion tube and transmission mechanism of the Inter-State is retained. Sundry minor changes in its assembly, such as the rearrangement of the engine auxiliaries and the rear suspension of the three-quarter elliptic pattern which have been adopted, enhance its value to the user without affecting the characteristics of its design in the least.

Now equipped with a Parker motor, and mounting the peculiarly sturdy pressed steel rear axle, which is a boasted product of its builders, who long have been known as parts producers for the automobile and carriage trades, the latest McCue model embodies several original not to say striking features. Among other details which display considerable forethought is the method of mounting the brake equalizing levers in the frame. The levers in question are in the form of flat bars which extend entirely across the chassis. Their ends are guided in a slotted housing on either side of the car, which contains the releasing springs. The springs act in compression, and being completely housed in the manner indicated, are protected from any chance injury, while the release of the brakes is rendered certain.

Of the foreign cars displayed, there is but one that really merits the distinction "new"—the Isotta-Franchini Voiturette. It is the smallest four-cylinder car in evidence, if not in existence. It is every inch an automobile, however, but it is so small and so low that it appears like a toy or a vehicle for a rich man's child. It is of the racing or roadster type, and except that it employs a block motor, instead of one with independent cylinders, it incorporates all of the Isotta features. Despite its juvenile size and appearance it is listed at a full grown price, \$3,500. To many investigators the wire and lead seals attached to the gear boxes, carburettors and other parts of the Isotta cars appeared curious, indeed, and caused considerable inquiry. The seals, however, are due not to custom house practice, as some people supposed, but to the fact that the cars are sold under a maintenance agreement, that is, if anything goes wrong, it will be repaired without cost, provided the seals are unbroken.

The De Dion-Bouton exhibit is notable as containing the only eight-cylinder car, one with a V-shaped motor of 50 horsepower. The frame is flat or level, the rear axle being curved rearwardly to provide room for independent shaft transmission, the shaft being bolted instead of having universal joints.

STODDARD-DAYTON LIMOUSINE.

BRUSH COUPE.

The Panhard, for the first time in this country, shows a car having a block motor, a practice at variance with the makers' long championship of cylinders in pairs. The Panhard people have also cleared the steering wheel of all switches and levers, the ignition being stationary and the throttle being operated by a set lever on the dashboard and a pedal accelerator.

The Lancia is another car which has been converted to the use of block motors.

The C. G. V. models are distinguished as being the only imported cars having left-hand drive; the levers incidentally are positioned in the center of the cars.

#### Bodies and Striking Finishes.

Unless it be the so-called torpedo or gun-boat type, there is no radical development in bodies shown at the Palace, though the use of larger and roomier bodies is, of course, one of the most pronounced tendencies of the times. But the torpedo body really is the only new design in evidence, and it is fair to say that seated in some of them, a short person looks not unlike a pea in a quart measure.

Of this new type six examples are shown. A general description covering all of them would include: Sides higher than in the standard touring model; dashboard is curved forward and upward for about 12 inches to form an effective wind shield, and driver's seat is as completely enclosed as the rear seats. In several instances the doors on one side of the front seat have been omitted. Special features not included in this general description are: In the Marmion, the space above the running board on the left of the tonneau is utilized for the storing of spare rims and tires. In the Speedwell the double doors in front and rear are retained, and the levers arranged inside. In the Stoddard-Dayton the tool boxes, instead of being placed on top of the running board, are riveted to the underside of the same and opened the same as drawers in a desk. These boxes, or drawers, are very shallow (about 2 inches deep) and as nearly invisible as possible. In the Fiat the sides are very high, reaching above the shoulders of the passengers.

Among the "standard" touring cars that are much discussed at the show is the big Delaunay-Belleville, fitted with a Brewster body. This roomy seven-passenger car can be changed from an open touring model to closed landaulet in a minute merely by raising the front and side windows and letting down the pantasote flaps in the rear. It is luxuriously upholstered and has a wheel-base of 140 inches.

Another striking touring car is the brown finished Pullman, the effectiveness of the finish being heightened by upholstering to match. In limousines the tendency towards greater size is more pronounced than in any other type. The Stoddard-Dayton cars of this type easily can be recognized by their high doors and window casings, lending to them an air of marked distinction.

AMERICAN ROADSTER.

FIRESTONE-COLUMBUS.

SPEEDWELL TORPEDO.

MARMON TORPEDO.

The coffee-brown finish of one of them is extremely odd and said to be serviceable.

No really striking features are visible in the laudat type of cars. Greater luxury in the inner finishings and upholstery, larger tires and heavier body, are the slight changes apparent. But in another class of closed cars, the inside-driven coupe, a number of innovations are evident. In the Fiat coupe, for instance, there are two full-size seats and a small corner seat inside, and a small rumble seat in the rear for an attendant. It is one of the roomiest cars of this type. Another foreign coupe, the Lancia, offers a novelty in the folding back of the driver's seat so as to allow ingress from the right side as well as from the left. The body of this car was made in London for the Lancia chassis.

Among the roadsters there are a number which merit mention, among them the National, a powerful white roadster credited with 72 miles an hour. It probably is the raciest-looking machine in the Palace. The two seats are extremely roomy and comfortable—a factor not to be despised in a fast machine—and the gas and oil tanks in the rear are especially capacious, affording a great touring range.

The Inter-State roadster, though comparatively a small machine, provides a roomy rumble seat in the rear by a clever arrangement of the gasoline tank in the back of

folding rumble seat, complete cover and bright red finish make an attractive looking machine.

#### Springs and Their Mountings.

It had been supposed that the matter of spring suspension had been pretty well settled by the more successful designers. The general prevalence of the semi-elliptical system during the past two years seemed suf-

ficient, which, though already familiar as an element of cars which have appeared at former shows, is this year presented to a degree which, at any other time would be deemed sufficient to constitute a trend.

Without attempting to sift out the theory upon which this system of spring mounting is based, suffice it to indicate that with a given total length of spring to be accounted for, considerable economy in over all length

MCCUE TOURING CAR.

INTER-STATE TOURING CAR.

the permanent seats. The tank is long and high, but extremely shallow, barely  $3\frac{1}{2}$  inches thick. This compression of the tank gives an extra space of at least 12 or 15 inches to be used for the passenger's convenience.

An odd appearing roadster with an exaggerated buggy top is shown in the C. G. V. exhibit. Its construction is such that ingress must be very difficult to any but the most agile people, the peak of the hood and the top of the dash almost meeting. A

sufficient guarantee that in its action the required degree of cushioning effect had been secured. It is true, certain builders continued to adhere to the full-elliptical pattern, while still others, especially in the case of particularly heavy machines, preferred the use of the semi-platform system. From the newer models on view at the Palace, however, it appears that some of the makers are revising their views. This is evidenced most strongly in the increasing adoption of the three-quarter elliptical rear

is accomplished by the use of the "demi-pincette" as the foreign designers love to call it. The point which probably appeals most strongly to the builder, however, is that with the three-quarter elliptic arrangement, the tendency to prolonged oscillation is materially reduced. There are some designers, indeed, who insist that a practical effect of shock absorption is obtained where the suspension is not symmetrical in all its parts.

To be more explicit, the three-quarter elliptic suspension is composed of these elements: First, a flat, semi-elliptical base spring, which being generally arranged with equal lengths before and behind the axle, tends to vibrate harmoniously whenever displaced; second, a quarter-elliptical member, rigidly attached to the frame at its stub end, which when displaced, tends to regular oscillations, but at a different rate of vibration from that of the main member; third, a scroll end, formed by curving over the lower leaf of the quarter spring, which, at its very end, is subject to periodic vibration, more rapid than that of either of the other two elements. Theoretically, the combination may be said to be sufficiently yielding for all practical purposes, yet to have very little tendency to violent rebound, or to continued oscillation after the initial shock and recovery. Another point in its favor is that it permits the axle to be set well back, without involving the use of long dumb irons uselessly protruding in the rear.

A very good example of this construc-

tion as applied to the heavier type of car is displayed in the Stoddard-Dayton cars, wherein the quarter spring is firmly gripped between upper and lower extensions of the rear cross frame member, which is formed after a fashion which has proved particularly satisfactory in foreign practice. The upper and lower flanges of the rear cross

STODDARD-DAYTON.

member, instead of being trimmed flush with the side members, are broadened out to form heavy gussets for the corners, and also are extended beyond sufficiently to project a trifle outside the spring. The usual clips and central stay bolt are brought down through both the frame extensions and the spring leaves, clamping them firmly together, and also acting as a sort of binder for the frame itself, the clamps and the stiffening effect of the frame sides co-acting to prevent the quarter spring from prying its way out of its perch. Both semi and quarter springs have clips applied to the longest sustaining leaves, while the fact that the rear of the frame is dropped, affords ample room for spring action.

A neat detail of the same chassis, which may be alluded to in passing, is the manner of suspending the rear gasoline tank, which is cylindrical in form and carried entirely behind the frame. It is hung from an arched yoke, made in a form roughly suggesting a ship's davits, which is of T-section, but with its central web cut away to eliminate needless weight. The sustaining strap passing under the tank is bolted to the extremity of this casting.

Another application of the same principles is found in the Pennsylvania, in which

PENNSYLVANIA.

a very solid supporting bracket is affixed to the side of the frame, not at the extreme rear, but several inches in front of it. As a matter of fact, the spring support is brought just forward of the triangular gusset plate which stiffens the frame corner. This position for the quarter spring, permits a corresponding addition to the length

of the otherwise rather long upper member of the suspension, resulting in considerable added elasticity. The considerable length of the semi-elliptical member also is noteworthy in this connection, while one structural feature which should not be overlooked is the use of "kitten ears" on the leaf ends of the upper spring, whereby the leaves are prevented from losing their alignment.

In many respects similar to this system is that employed on the Glide cars, save that in the latter instance, an entirely different form of supporting bracket is used, which also serves the useful purpose of up-

GLIDE.

holding the rear mud-guard bracket. The top clamping plate which holds the spring leaves together, has a vertical extension, which is drilled out to receive the mud-guard supporting arm, which, in turn, is secured in place by means of a pinch bolt. The quarter spring member in this instance, is notably short and stocky, while the drop frame construction permits a large amount

PULLMAN.

of spring play, and also allows the axle to be brought back under the end of the frame.

The new model Pullman, on the other hand, has a rear suspension which is out of the ordinary in that the lower and semi-elliptical member is set very nearly flat, or with a low arch, while, as the vehicle is designed for a light load, the allowance for motion is comparatively small. Another point of distinction about this system is that the point of attachment of the quarter

MITCHELL.

spring member, instead of being directly over the axle, as is commonly the case, is placed slightly back of it, thus reducing the length of the upper member of the group considerably.

Three-quarter platform suspension, like the three-quarter elliptic pattern, appears to be gaining new converts. The Mitchell six-cylinder models are so equipped, among others, the method of hanging being notably free from the clumsiness which characterized some of the earlier attempts at platform suspension. A simple and sturdy cast-

JACKSON.

ing supports the rear cross member in the centre of the frame, a plain universal shackle fulfilling a very necessary function in connecting the cross and side spring members. Certain models of the Pennsylvania, National, Mora and Chadwick also display this type of mounting in varying form.

The full elliptic rear suspension, sometimes with the pivoted connection of the upper member elevated above the frame, as in the Jackson, is adhered to by not a few builders. This form of suspension always has been a stronghold of the Marmon constructors, while on one or more models of the Reo, Maxwell, Lambert and Moon, it is to be seen. The new Everitt "30" has it, as have the new Paige-Detroit and Black Crow cars, as well as the more familiar Cameron, Middleby and Regal.

The spiral mounting of the Brush long ago vindicated itself, though still remaining an object for amazed contemplation, so radical does it appear. The same, in a general way, applies to the under-slung models

EMPIRE

of the American, which still continues to refute the contention that it must be impossible to carry the frame below the axles without disaster. The new little Empire has a most remarkable example of full platform mounting in the rear, the cross member supporting a tapered extension of the

frame which is brought to a point in order to connect with the spring. The side members, it should be said, are slung beneath the axles. This car also has three-quarter elliptic members in front.

Perhaps the most unusual application of the spring drive principle appears in the

McCUE SPRING.

McCue car, wherein, contrary to ordinary practice the rear members are offset forward. The semi-elliptic side members are 54 inches long. Only about 18 inches or so

Gaeth, Ohio, Halladay and Demot car. Special forms of suspension worthy of individual mention, while not numerous, still are more or less remarkable. The Ford rear cross spring, is retained as a matter of course. The Hupmobile has the same device in a different form, while the triple action principle is displayed to advantage on the Pierce.

#### Magnetos and Their Mounting.

Evidence is not lacking that automobile designers have quite passed the hysterical stage in which, having completed a motor to their entire satisfaction, they proceeded to attach the necessary accessory devices, carburetters, lubricators and what-not, in the most hasty and extemporaneous fashion imaginable. Indeed, with the settle-

disappearing on the more elaborate machines, by reason of the growing application of the crank case, circulatory system.

The result of these various considerations is extremely varied, though practically independent of the type of motor employed. The Ford engine, for example, is simplified in respect to its auxiliaries, because of the concealment of the low tension inductor type magneto in the fly-wheel casing. Thermo-syphon cooling, as applied to the Maxwell, Brush, Premier, Moline and the new Ohio, further simplifies the problem by eliminating the pump from consideration; while in some instances some degree of apparent simplicity is obtained where the auxiliaries are divided, the magneto being placed on one side and the circulating pump on the other. As a matter of fact,

#### VARIED METHODS OF MOUNTING THE MAGNETO.

protrudes back of the axle, while the front portion affords a sort of radius-rod effect, in addition to carrying the traction load necessary to the propulsion of the machine. One advantage claimed for this arrangement is that it tends to offset surging in the springs, having, indeed, a sort of spring damping, or shock-absorbing tendency. The front members of this car also are offset, an unusually long wheel base thereby being gained.

For the front, few radical changes appear this year. Most of the makers adhere uniformly to the semi-elliptical pattern, and, truth to tell, it is difficult to see how it can be improved in most cases. With rear springing, there always is the complication of driving to contend with, and this is the real occasion for the great amount of variety to be observed.

The old reliable semi-elliptical mounting is retained by the makers of such cars as the Pullman, on certain models, at least; and the Midland, Coates-Goshen, Moline,

ment of many formerly perplexing questions of motor design, the American builders have reached a point where they have both the leisure and inclination to treat the problem of the engine auxiliaries from a more or less independent standpoint.

As a matter of fact, the neat and apparently simple exteriors of many of the motors directly reflects the result of much study in this direction. The carburetter, must bear a certain relation to the intake manifold, it is true, but many engineers find it possible to place it on either side of the car, according to contingent circumstances, and quite regardless of the position of the inlet valves. Similarly, the position of the water pump is determined to a greater or less extent by the arrangement of the piping, and the facilities for driving. In the case of the magneto, on the other hand, practically the only requirement is for a solid base and a convenient and cheaply constructed system of driving. External lubricators, it may be added, are fast

the auxiliary problem in its most perplexing phases, is reduced to the point of locating to advantage the pump and magneto, since it is they alone which require power as well as a secure and convenient location. The position of the ignition timer, it may be said in passing, has become of less moment than formerly, since in so many instances, dual ignition is employed, and the timer for the battery side of the system is the same as is contained in the body of the magneto.

Taking up a few random examples of magneto and pump location and drive, will suffice to show that practically no direct advantage has yet been found to center about any one method of mounting and connection. For the most part, power for the auxiliaries is derived from an extra spur gear meshing with one of the timing gears. Where the auxiliaries are divided, two such gears are necessitated. Occasionally a third source of motion is developed directly from one of the cam shafts by

means of spiral gearing. Such arrangements are found in more than one instance where an oil circulating pump is placed low down in the crank case.

One instance in which it is utilized in another way is in evidence on the Premier show chassis, where a force feed lubricator is mounted on the left side of the motor, midway of the crank case, and driven from a short cross-wise shaft, which protrudes from the side of the engine base, and takes its motion from the cam shaft. Directly forward of lubricator is the centrifugal fan, which is driven by a short length of shafting from a gear enclosed in the forward housing. On the opposite and right side of the chassis, the magneto is mounted. The driving shaft here employed is carried back from the gear housing in a specially long boss, which extends through to the rear web of the engine supporting arm, and is equipped with "dope cups." The universal joint, which is an accompaniment of all well-assembled magneto drives, is inserted in the short length of connecting shaft between the crank case arm and the armature itself.

On the Mitchell six, the magneto and pump are assembled very compactly on the left side of the chassis, together with the carburetter. As the engine sets rather low in the frame, relatively speaking, and as the entire engine unit is designed with a view to the maximum possible compactness, considerable ingenuity has been displayed in placing the auxiliaries in order to afford them ample room and still avoid unnecessary extension of the limits of engine space. Indeed, the result in a way suggests the close figuring which is evidenced in the engine room arrangements of a battleship. The centrifugal circulating pump is placed directly behind the gear housing, with the magneto behind it, separated by a flexible and readily demountable coupling. The carburetter, being placed directly back of the magneto, forward portion of the inlet manifold comes close down over magneto and pump, giving the impression of extreme compactness.

The new model of the Inter-State emphasizes clearly the advantage of giving thought to the arrangement of the accessory parts of the power plant. Both pump and magneto now are afforded ample space and good operating conditions by being supported on the left side of the engine, well toward the front. The centrifugal pump, indeed, is placed directly back of the timing gears, and in front of the forward engine supporting arm. The driving shaft is carried through this arm to the magneto, to which it is connected by means of the favorite Oldham coupling.

An example of the use of the auxiliary driving shaft for the actuation of the cooling fan back of the radiator is to be seen in the Pennsylvania chassis, in which the fan pulley is placed just behind the gear housing. The shaft extension from this point, is connected by means of a flanged

coupling, which facilitates dismounting the parts. The driven section of the shaft passes through the gear pump, and is joined to the armature shaft of the magneto by means of an Oldham connecting member.

MAXWELL.

Instanting the appreciation of certain designers of the need of more extreme flexibility in the magneto drive than is possible with the Oldham style of coupling, the National system is worthy of notice. The fan driving pulley, centrifugal pump and magneto all are mounted on the left of the engine, in the new four-cylinder 40 horsepower model. The magneto, instead of being set close behind the pump, however, is placed well to the rear of it—just in front of the dash, as a matter of fact. By way of connection between the pump and magneto, a special form of coupling is used, which is broadly suggestive of the double-jointed type of propeller shaft. A solid connecting

JACKSON.

bar, of six inches length or more, is grasped by the jaws of the two coupling members on the shaft and armature, respectively. The ends of the bar are flattened out, the flats being at right angles to one another, so that the effect of the true cardan shaft is secured. In this way, although there may be no apparent reason for any appreciable movement between the pump and magneto, all possibility of straining the armature shaft or its bearings from such a cause is eliminated. The arrangement also permits the magneto to be dismounted with very little difficulty.

Interest in the design of the new Everitt 30 car, does not permit the arrangement of

its magneto to be overlooked. It is placed on the left of the motor, along with the pump. But, contrary to the practice found in some other machines, the driving shaft does not pass through the supporting member for the front end of the crank case, but under it instead. This is due to the fact that the crank case is hung from separate engine supporting bars, instead of by integral arms. The pump, which is of the centrifugal type, is placed in front of the magneto in the conventional way.

Unlike the arrangement of any other car in the show, the new Maxwell chassis, possesses the unique feature of a magneto mounted on the clutch housing. The unit type of power plant is used on this, as on all the Maxwell cars, and this provides a ready and stable support for the ignition device beneath the incline of the floor board and in the very center of the car. The induction coil which is used with type of ignition system used, is carried on the left of the dash, but also concealed by the incline of the floor board.

Still another unique magneto arrangement is employed on the new Jackson 30 car. The unit power plant is a feature of this machine, and the magneto, instead of being tucked away low down on one side of the chassis, is carried by the unit, on top of the rear cylinder. By reason of the overhead valve gear of this motor, and the peculiar valve driving system employed, magneto drive is readily arranged for by means of a spur gear at the back of the magneto. The latter is placed on the rear cylinder, and hence, comes directly in front of the dash, and immediately beneath the hood. The induction coil also is housed under the hood, and is affixed to the dash.

#### COMMERCIAL VEHICLES.

With a total muster of 40 vehicles of varying types and sizes, the commercial vehicle section of the Palace show has come to assume more sizeable proportions than ever before. Four of the exhibitors are newcomers, one of the latter being an importation, namely the DeDion. This product is represented by a chassis, borrowed from one of the Fifth avenue 'busses which are in constant service in New York City, and said to have covered over 50,000 miles. The other is a stake truck of less massive proportions, but not remarkable for novelty of design. One rather striking feature about it is the use of the Bosch dual ignition system—a refinement ordinarily reserved for pleasure vehicles alone.

Quite the most ingenious mechanical novelty of the commercial section, and indeed, one of the remarkable devices of the entire show, is the transmission mechanism which has been adopted for the Carlson truck. It is of the planetary type, but is doubly distinctive in that but one planetary pinion is employed in its construction, or to be even more explicit, only three gears in the entire device; while its entire actuation is secured with the use of but a single brake band, in

addition to the high speed clutch. The single pinion is meshed constantly with the driving gear and with an annular gear cut in a floating ring. Braking the ring or the drum which carries the pinion, in turn serves to secure the low speed forward and reverse drives.

For the purpose of interchangeability the entire power plant, including the fuel and water tanks, and the driver's seat, may be slid out of the chassis, merely on the removal of six bolts, and without the necessitating the uncoupling of any joints. Both the driving and steering shafts telescope together, while the pedal braking mechanism is mounted entirely on the chassis. Because of this provision, the somewhat unusual device of mounting the steering gear back on the chassis, while the steering column is carried in front, in the usual position, is employed. Connection between the steering column and the steering gear is carried out by means of a horizontal shaft.

The motor is of the four-cylinder opposed type, and is constructed with definite regard to the economy of time in making adjustments. With this object, either of the sets of valve lifters may be removed by releasing a single plate, while the removal of four nuts, permits the crank case cover plate to be lifted off, bringing with it the valve lifters intact. A two-throw crank shaft is used, the connecting rods being attached to the cranks by means of hinged straps. Such is the arrangement, that upon removing the single bolt in either of the caps, the corresponding pair of pistons may be removed without further difficulty.

The third newcomer is the Martin, which appears in the form of a light delivery truck,

with opposed motor and planetary change gear in the form of a unit, the engine being on the left and the change gear on the right of the car. Drive is by side chains, from a counter shaft which is placed directly back of the power unit, and formed integrally with it. Full elliptic springs are used, those in the rear being of scroll and pattern. Thirty-six-inch wheels and 2½-inch

CARLSON STEERING GEAR.

solid tires are standard equipment. The machine is original throughout and reveals a number of unusual and novel devices.

Two-cylinder opposed motors are strongly in favor with the builders of the Randolph, which also has not been exhibited at the Palace before this year. In this machine, however, sliding gears, selectively actuated, with side chain drive, constitute the transmission mechanism. This machine

is built in the form of a delivery wagon—a type of commercial which appears to be gaining in numerical strength, despite considerable delay in its evolution.

Similar in general purpose also, is the Chase, which is distinguished by a three-cylinder, air-cooled, two-cycle motor mounted vertically in front. It has an original and ingenious transmission system and is mounted on large wheels equipped with solid tires. The Reliance is the other two-cycle adherent in the commercial section.

In addition to the DeDion, a second foreign importation, the Saurer, makes its reappearance. This solid and well-designed machine is equipped with such refinements as compressed air starter for the motor, compression brake, and magneto ignition, and is a magnificent piece of vehicle construction.

The Hart-Kraft, with its opposed motor and large, solid tired wheels, which is built for delivery purposes mainly; the Gromm-Logan, shown this year in light and heavy truck form; the ingenious Grabowsky, with its removable power plant; and the Mack and Rapid exhibits, complete the display of gasoline vehicles. The two last named are of the class which undergo few alterations from year to year, and are produced in great variety. Consequently these two exhibits nearly equal in volume the combined displays of all the other commercial vehicle people. The sole exhibitor of electric sizes for a variety of purposes, and also in a special dock and industrial transfer truck of unusual construction, with one pair of wheels in the centre and a single steering wheel in the centre at either end.

## Revelations of the Accessory Department

Getting directly at the matter of what new things are disclosed in the accessory section of the Palace show, the seeker of these is rewarded beyond reasonable expectation. So prolific has been accessory production in the past years that to ask for further novelties is demanding a good deal, but they are forthcoming nevertheless. Many of them are in the nature of neat little tricks of detail improvement and refinement but more important are those which are radical entireties quite different from anything heretofore disclosed.

A great proportion of the names in the accessory section are those of concerns already well known to the public and the trade, but a mere recognition of the firm and a knowledge of what it has been marketing in the past is no guarantee to the show visitor that he safely can pass its exhibit on the assumption that nothing new will be found in the space. In fact the veteran accessory manufacturers have been just as busy as the newcomers during the past year in developing improved forms and advanced ideas.

In the field of speed indicators and odo-

meters, for instance, two distinctly new things are sprung. One of these is a so-called "live map," which both in form and purpose is unlike anything previously put on the market in a practical commercial way, although the idea back of it has been embodied in one or two experimental models. The device, which is exhibited by the United Manufacturers, is the product of the Jones Speedometer Co., of New York, and has for its purpose the giving of automatic road directions for any given trip, these directions being printed on a disc which revolves according to the distance traveled by the car while a stationary indicator hand points to that portion of the "map" corresponding with the car's actual progress on the trip.

A speed indicator and odometer actuated pneumatically and not by centrifugal force or magnetic drag is the innovation put on view by the Troy Carriage Sunshade Co., of Troy, N. Y. The fact that it does away with the use of a flexible shaft is urged as a "talking point" and the pneumatic drive permits more than one instrument to be operated on the one line of air pressure.

At first glance even the most experienced electrician would have some difficulty in identifying the "igniter" which the Witherbee Igniter Co., of Springfield, Mass., is showing for the first time and which, while essentially a magneto in principle, is of such unusual form and operation that loosely speaking it is not a magneto at all, as ordinarily understood by the public. The use of snap-off cams and trigger arrangements for giving sudden movement to magneto armatures independent of the rotation speed of the engine is quite common, but the Witherbee device, which is designed for high tension ignition service, accomplishes the result in an extraordinary manner and by a most ingenious construction, so that the "igniter" is truly one of the newest and most original of the original things at the show.

On Monday there was installed at the Gray & Davis exhibit an electric lighting system for cars which the Amesbury (Mass.) firm has espoused, marking the branching out of a lamp manufacturing concern into the field of supplying the current generating equipment as well. The system,

while in some respects resembling others having the same object in view, has many minor features of difference and is the latest thing of its kind, both in respect to the electric current features and the lamp filaments.

For the first time the Connecticut Telephone & Electric Co., of Meriden, Conn., exhibits, in the United Manufacturers' space, a magneto of its own make, thus filling out an exceedingly complete line of ignition goods. The device is of what might be termed "conventional" general design, but is marked by an assembly and a care for detail which presents features of distinction from the common types.

A magneto for the astonishing price of \$10 retail is a new offering of the Motsinger Device Mfg. Co., of Pendleton, Ind., though the instrument is not suitable for high tension work and is intended only for make and break. The new Heinze magneto, made by the Heinze Electric Co., of Lowell, Mass., is marked by an arrangement for varying the position of the armature on the shaft so that with variations in the timing the spark always comes on the peak of the current wave.

Not on public view, but for private inspection and approval by customers in the trade is a new jack which just has been completed by the Oliver Mfg. Co., of Chicago, and of which only the one model in bronze has been made. It is remarkable in that there is not a bolt, spring, ratchet or screw in its construction and it consists of four simple pieces which go together and make a complete jack in a way which is surprising when it is shown.

In addition to bumpers and equalizing springs, a shock absorber has been given a place in the line produced by the J. H. Sager Co., of Rochester, N. Y. While resembling the best known friction type absorbers in appearance, its internal construction is quite unique, employing a triangle of plate springs and a locating cam, designed to give free action in the normal range.

A small edition of the Klaxon horn, called the Klaxonet, makes its trade debut in connection with the Klaxon exhibit of the Lovell-McConnell Mfg. Co., of Newark, N. J., and Klaxon Horn Co., of New York. The pitch is considerably higher than in the regular Klaxon and the horn may be worked on four dry cells.

As competitor in the non-skid chain field, the Fox Metallic Tire Belt Co., of Brooklyn, N. Y., has come out with the Fox chain, the links of which are of a pattern which presents broad flat surfaces to the tire and multiplicity of stout contact points to the roadway. The clamp for tightening up the circumferential side retaining chains around the tire is efficient in providing an adjustment for taking up slack.

When block type solid rubber tires were introduced for commercial vehicles it was found in some instances that it was difficult to avoid a series of bumps or jars as

#### WHERE ACCESSORIES ARE ON DISPLAY.

LOOKING DOWN THE ACCESSORY GALLERY IN THE CENTRAL COURT.

TYPICAL VIEW OF THE ACCESSORY DISPLAYS.

the various blocks came in contact with the roadway, and this despite an alternate placing of the rubber blocks around the periphery of the wheel. This trouble has not only been overcome by the Consolidated Rubber Co., of Akron, O., in the case of double rows of blocks, but the company even dares to exhibit a wheel with a single series of rubber blocks presented to the road, claiming that the bumping effect is eliminated by reason of the fact that the blocks instead of being rectangular as viewed from the side are divided by slots the sides of which are parallel from the wheel rim to the tread surface. For the first time the company also shows a steel studded pneumatic tire.

A six cylinder, two-cycle, air cooled rotating motor in which the pistons revolve around a common center is exposed for its first public inspection by the L. A. W. Motors Co., of Providence, R. I., the inventor being Oliver Light, superintendent of the R. L. Morgan Motor Truck Co.'s plant at Worcester, Mass. No connecting rods are employed and there is no stationary or movable crank. The pistons work outward on explosion and have ball bearing ends which

press against a circular track eccentric to the rotation of the cylinder group. This eccentricity permits in and out piston movement as the near and far sides of the circu-

L. A. W. MOTOR.

lar track are followed by the roller bearing piston ends. The cylinders themselves are offset from their axis of rotation. As they revolve, the ports in their heads register with openings in the central supply chamber

for blower-fed gas and after compression are supplied with flame ignition in a similar manner. The conditions imposed by the construction and principle have been met by resourceful detail design, as for instance in the disposal of the exhaust which after leaving the cylinders through side wall ports at the bottom of the stroke is centrifugally pumped out of the all-enclosing engine case by the revolution of the cylinders, which also draws fresh air in at the center of the case.

Much of the accessory display, while having its initial New York show appearance, already has become more or less familiar to the public and the trade through introduction and advertisement during the past summer and fall or through being staged at Atlanta in November. Another portion, while new in a sense, represents detail refinements on types or models already widely known and established as standard.

As an assistance in their consideration they probably are best taken up in groups.

#### Tires and Tire Accessories.

Non-skid treads of almost every conceivable pattern are to be found in the score or

more of pneumatic tire exhibits of established manufacturers, the treads ranging from steel studded leather to helixes of piano wire imbedded in the rubber, and including raised rubber lozenges, blocks, knobs, diamonds, corrugations, Maltese crosses, ribs, suction cups and round projections, not forgetting the alphabetical design employed in one instance to print the tire name in soft mud in reverse. Removable non-skid devices also are well represented, the Weed chains of the Weed Chain Tire Grip Co., New York, and the chains of similar appearance offered by the Garage Equipment Mfg. Co., of Milwaukee, Wis., constituting a type which is being chal-

lenged to competition by the Fox chain which the Fox Metallic Tire Belt Co., of Brooklyn, N. Y., has produced and which has peculiar pressed steel links for giving a flat surface toward the tire and a studded or multi-pointed surface to the road. The Traver non-skid device, made by the Philip C. Traver Mfg. Co., of Far Rockaway, N. Y., utilizes flat plates with flared and outwardly projecting edges instead of cross chains. The non-skid plates are attached to short chain links on either side, which in turn are attached to the side wire chain members that circle the wheel on either side. Another form of the device permits the use of the plates as units, one or more of which may be applied to a tire by a wire locking adjustment attaching to individual spokes of the wheel.

variety of small vulcanizers which may be heated by alcohol, gasoline, electricity and gas, respectively. The latter fuel is used in the Garage Equipment company's portable type, the claim being made that the device not only may be connected to an ordinary gas jet by means of a rubber tube, but may be used for roadside repairs if connected up with an acetylene generator or compressed gas tank.

"Airless" tires, having interior rubber bridging to take the place of air pressure, are not shown to the same extent as formerly, the Dayton being the only one of this kind that is represented. The Atlas Rubber Co., of Buffalo, N. Y., has a "punc-

breaker box, although the device gives high tension current in return for mechanical work. According to the demonstrating salesman the result is accomplished by "short-circuiting the magnetism," which expresses the idea fairly well. Reference to the illustration of the essential part of the igniter shows at the top the three plates which are the permanent magnets. The two curved pole pieces have extensions down through the two high tension coils. Between the coils is a movable I-shaped member having a "magnet keeper" at each end, but sufficiently long so that if the "keeper" at the bottom is up against the ends of the pole pieces, the "keeper" at the top is slightly raised from contact with the pole pieces. Stout spiral springs on the sides snap the "keeper" member down after it has been raised by a cam pressing upward on the projecting end at the bottom. The bottom "keeper" is by this action released from the pole pieces, while the "keeper" at the top comes into contact to connect the two, with the effect of making the magnetic flux extend from the permanent magnets at the top across the "keeper," leaving "dead" that portion of the pole pieces below it and which goes through the coils. This sudden demagnetization in the coil cores induces a powerful high tension current, which is sent to the various spark plugs through a high tension distributor that constitutes a part of the instrument. The cam which oscillates the armature bar with its "keepers," or armature, has helical drop-off edges and its position on the rotating shaft may be varied to change the time of the spark. Not only is a spark produced no matter how slow the rate of revolution of the cam-shaft, but it can be produced by manipulation of the spark or timing lever, which controls the cam position and which can make the latter move under the tappet end of the armature bar and snap it. Consequently, a motor may be started "on compression" by juggling the spark lever and without cranking. A price of \$60 has been placed on the four cylinder type. An accumulator of 100 ampere hours is shown, together with all Wico specialties.

Although it was exhibited last year, the Seeley ignition system of the High Frequency Ignition Coil Co., Los Angeles, Cal., is still something of novelty, both because it provides a small individual high tension coil on the top of each engine cylinder, close to the spark plug, and because it gives a spark of over a million oscillations per second without the use of a vibrator, the effect being obtained by electrical resonance when the condenser of the system discharges with an oscillating current through the primary of the individual coils or resonators on the cylinder tops. The company shows its new Seeley duplex low tension magneto, which is priced at \$35, and which can be used for the Seeley system, for vibrator coils or for make and break.

Magnets of round bar section are em-

DIAMOND DEMOUNTABLE AND QUICK DETACHABLE RIM.

lenged to competition by the Fox chain which the Fox Metallic Tire Belt Co., of Brooklyn, N. Y., has produced and which has peculiar pressed steel links for giving a flat surface toward the tire and a studded or multi-pointed surface to the road. The Traver non-skid device, made by the Philip C. Traver Mfg. Co., of Far Rockaway, N. Y., utilizes flat plates with flared and outwardly projecting edges instead of cross chains. The non-skid plates are attached to short chain links on either side, which in turn are attached to the side wire chain members that circle the wheel on either side. Another form of the device permits the use of the plates as units, one or more of which may be applied to a tire by a wire locking adjustment attaching to individual spokes of the wheel.

By a happy combination of the Marsh quick detachable and the Diamond demountable rim which also is quick detachable, in permitting the removal or replacement of a tire on the demountable section. Heretofore the Diamond demountable has had a plain clincher rim removable and replaceable on the wheel, but the application of the Marsh detachable to the demountable is revealed for the first time in the demonstrating sample on view at the Diamond stand.

For the repair of tires a great many kinds of "dope," mastic and "cold vulcanizing" preparations are presented, together with a

ture proof" inner tube. These are practically the only "unconventional" pieces of tire construction that are shown, with the exception of Newmastic filling.

Tire pressure gauges, tire tools, emergency patches and minor devices of like character are plentiful, and two new demountable rims, the Howard and the Dorian, are staged, but most of the exhibits relating to tires are of forms already familiar. There is small room for improvement in the better known tires of today.

#### Ignition Appliances.

Twenty-two different makes of magneto is "going some," even for so large a show as that at the Palace, and the fact that this is the number exhibited is in itself indicative of how dominant the magneto has become in motor car ignition. The well known American makes, such as Remy, Splitdorf, Heinze, Pittsfield, and Volta, not to mention the K-W and the W. & S., are supplanted by recent recruits in the Connecticut, the Seeley, the Kingston, the Wico igniter, the Osborn, the S-X, the National and the Motsinger, while the importations include the Bosch, Eisemann, the U. & H., the Herz, the Taunus, the Nilmelior and the Mea.

In the Wico "igniter," which the Witherbee Igniter Co., of Springfield, Mass., has developed, there is no revolving armature, no condenser, no primary winding and no

"TIRE GALLERY" IN THE CENTRAL COURT.

ployed for the Heinze magneto, of the Heinze Electric Co., of Lowell, Mass. The ends fit into recesses in the pole pieces in such a way that the union of the magnets and the pole pieces is very complete. A helical slot in the shaft of the magneto permits the variation of the armature relation so that the spark comes at the wave peak. A new kick switch has been added to the line of Heinze ignition goods, which includes coils and plugs.

The Pittsfield Spark Coil Co., of Dalton, Mass., discloses an improved dual ignition system, with the coil contained in the magneto. The Pittsfield magneto is the headliner of the company's offerings, but coils, timers, switches and plugs, for which the concern has been known for years, are prominent in the display.

An impressive showing is made by C. F. Splitdorf, Inc., of New York City, in the layout of Splitdorf magnetos, coils, plugs, switches and the like. The Splitdorf ignition system no longer requires that a switch coil be mounted on the dash, as those who prefer it may have a coil separate from the controlling switch, to be placed under the hood or elsewhere on the car.

To show the entire interior construction of the Remy magneto, the Remy Electric

WICO IGNITER.

Co., of Anderson, Ind., has sliced the various types down the middle, revealing the generous bearings and non-moving windings, which latter eliminate the use of brushes.

"Pivoting advance" by which the whole magneto rocks forward or back on its cradle with the shaft as an axis is disclosed in connection with Eisemann magnetos, exhibited by the Eisemann Magneto Co., of New York City, who now control the American rights. The object is to break the current when the armature is at the most favorable point for generating the current or, in other words, at the peak of the wave. The same intensity of spark is obtained at retard as at advance, and the rocking of the magneto from side to side does away with the use of a timer. The great range of advance which is obtained is suggested as being especially suitable for two-cycle engines, which require a much greater degree of advance and retard than the four-cycle type. As distinguished from models previously exhibited at the shows, the Eisemann magnetos now have helicoidal instead of straight pole pieces. While the magnetic field is being broken at one end of the arma-

ture it is being re-established at the other, giving a continuous circuit which prevents demagnetization of the magnets and causes the armature to revolve with ease.

No distributor is employed in the S-X ignition system, which comprises a low tension magneto and a dash coil for the high-tension. For a four-cylinder motor the magneto, which is made by the Lutz-Lockwood Mfg. Co., of Aldene, N. J., sends primary impulses alternately in two leads to the coils. Each of these leads induces high tension for two of the four plugs in the engine, one plug being on the working stroke and the other idle on an exhaust stroke. The working stroke is ignited by one of the two plugs which spark at every revolution.

Accumulators for ignition and lighting are present in great force, some of them in con-

A great decrease is observable in the number and variety of spark plugs that are offered, the Spit-Fire, the Soot Proof, Heinze and other veterans being supplemented chiefly by the Red Head, which if not a veteran is well matured, and by three or four others of lesser fame. Fred. W. Smith, of Aberdeen, S. D., revives the spark gap idea by equipping his plugs with small glass enclosed gaps at the top of the central electrode, giving a visible spark outside which is supposed to be a guarantee of a corresponding one inside the cylinder.

The Brown Co., of Syracuse, N. Y., shows a combination oil and grease gun. In a brass cylinder is a solid brass piston. The handle of the piston has a rack which in connection with a pinion, exerts great leverage when needed for heavy greases. For

and glare of automobile lamps of one kind or another equipped with electric bulbs. Some of the makers of storage batteries have launched into the lamp business from the electric side and lamp makers who heretofore have produced chiefly acetylene and oil lamps are placing their electric models right up on the front of the display counter. Not the least interesting development is the combination or convertible headlight, having an equipment by which the acetylene burner may be replaced by an electric bulb for city use. The Badger Brass Mfg. Co., of Kenosha, Wis., and Gray & Davis, of Amesbury, Mass., both show headlights so equipped, as does the C. M. Hall Lamp Co., of Detroit, Mich. Electric tail lights are not only in the lines of the big lamp makers, but in several cases have been

COMBINATION GAS-ELECTRIC LAMPS—SOLAR, GRAY & DAVIS, AND HALL.

nection with dynamo charging systems, like the Opico, exhibited by Charles E. Miller, the Motsinger system, and the Gray & Davis. The latter system, which has been perfected by Alex Churchward, has a dynamo driven by a friction clutch governor, with suitable means for controlling the cut-out when the battery is fully charged. The construction is such as to make the dynamo dustproof. At practically all of the stands where the storage batteries are shown, their utility in supplying electric lighting current for the car is dwelt upon quite as much as their availability for ignition purposes.

Dry cells have a much slimmer representation than formerly, but that they are by no means out of the running is indicated by the vigor with which they are talked at the four or five stands where they are shown. The National Carbon Co., of Cleveland, Ohio, again utilizes its extremely elaborate testing and demonstrating device to point out how proper ignition apparatus makes very long service possible from a few cells. Stanley & Patterson, of New York, present new models of the pattern battery holder for dry cells, the holders being equipped with switches by means of which different sets and combinations of cells in the box may be thrown into action without touching the cells themselves.

use with oil the T-handle alone is required.

Differing only in size and shape from the line of storage batteries which they have had on the market for the past three years the Geisler Bros. Storage Battery Co., of New York, are exhibiting a new cell which is radically different from any storage cell that has yet been shown. The new comer, which has been christened the "Midget" has all the outward appearance of the conventional dry battery. Of the same outward dimension as the ordinary No. 6 dry cell, it has the internal construction of the other Geisler storage batteries and like them is non-sulphating. The "Midget" batteries are two volt, 30 ampere capacity and are guaranteed by the manufacturers to retain their charge for months and not to deteriorate if left charged or discharged without being used for a long period of time. The concern also has a thermal alarm device, which, while not offered to the public is of much interest to the circle for which it is intended and is calculated to "wake them up."

#### Lamps.

Electric lighting for motor cars plainly has received an immense impetus since the shows of a year ago, because everywhere through the accessory section is the gleam

made an individual specialty of smaller concerns, who have worked out especially ingenious designs by which not only is a red rear signal displayed but the license number is shown as well.

In one model of the Badger company's Solar headlights a "dimming" effect for city use or for passing on country roads is obtained by providing a burner which is movable vertically and which through a Bowden wire control from the steering post may be raised above its normal focus point in relation to the lens mirror, so that instead of throwing a concentrated forward beam horizontally, the beam is deflected downward directly in front of the car and only the plain direct rays from the flame go forward. When released, the tip or flame is lowered by a spring to focus position and the lens mirror beam bends up to its original horizontal long distance position. The device is called the Solar "Raydebector."

Many of the gas headlights shown evince a certain similarity in the adoption of rounded and backward sweeping top hoods, which have been adopted by several of the lamp makers as a fashionable touch. Gun-metal finish has a place in the most of the lines, and one of the Hall models is unique in being of Russia iron, for commercial car equipment. Elaborate detail and fancy

shapes for both oil and electric side lights are the usual order.

#### Carburation Devices.

On the theory that by mechanically interconnecting the gasoline feed, the auxiliary air supply and the throttle to the engine it is possible to proportion the air and gasoline properly for all engine requirements, the Siro Carburetor Co., of Springfield, Mass., has produced a carburettor incorporating this mechanical interconnection. The butterfly throttle valve is joined to the auxiliary air control by a lever and at the same time governs the gasoline feed by means of gear wheel segment. A. R. Mosler & Co., of New York, enter the carburettor field with the "MB" carburettor, the two letters being the initials of Mosler, the manufacturer, and Breeze, the designer, respectively. The product is exceedingly compact, and the detail features have been evolved with no little ingenuity, particularly in the matter of the shape of the passages, the straining device and the priming provision.

The Bowers carburettor appears as made by the Gilbert Mfg. Co., of New Haven, Conn., which not long ago took over its manufacture. It is constructed on the Venturi tube principle with vertical draft direct through the center, the float chamber being concentric. Supplementary air is admitted through openings on an annular disc, these openings being controlled by phosphor bronze reeds of varying tensions. The Breeze, Stromberg, Byrne-Kingston and the imported G. & A. make the body of the other carburettors staged at the show.

No less than two concerns this year offer rotating fan wheel devices for attachment to carburettors, to assist the mixture of the gasoline vapor and the air. In each case the attachment is a ball bearing miniature turbine wheel which is revolved by the passage of the mixture on its way from the carburettor to the engine. The Erickson gas-vapor mixer is displayed by Raimés & Co., of New York, and the Homo by the Gasoline Motor Efficiency Co., of Jersey City.

#### Speed and Mileage Indicators.

Having been kept well under the hat until actually put on exhibition by the United Manufacturers at the show, the Jones "live map" comes as quite a surprise in its way, especially since it is quite out of the ordinary. The instrument, which is about 9 inches across, is an odometer in principle, but instead of giving its mileage readings in the usual way, it revolves a white paper disc on its face, the rim of the disc being marked off for 100 miles of readings. The divisions represent about 170 yards each, or a tenth of a mile. A stationary pointer on the rim of the instrument denotes the car's location. Discs for different trips are provided and as the markings come under the pointer the road directions for that part of the journey apply. When a new disc is inserted or a trip started at some intermediate point on the chart that is in the in-

strument, a resetting device permits the car's location to be set correctly.

Charts for about 160 different trips already have been prepared, and 600 route cards, covering every section of the country, are promised for distribution before spring. Popular trips in Europe also may be handled in the same way. Retail purchasers receive a six months' membership in the Touring Club of America, which has charge of the distribution of the route cards, and in addition a number of the cards, selected by the purchaser, are supplied.

The "map" is driven from the front wheel of the car by means of a long flexible shaft, and instead of being attached permanently on the dash or elsewhere it may be removed from its hook and leather holder for refer-

JONES LIVE MAP.

ence to the passengers in the front seats or the tonneau.

Pneumatic operation for a combined speed indicator and odometer is one of the few principles that have not had previous exploitation, but the Troy Carriage Sunshade Co., of Troy, O., discloses how it can be accomplished. A simple rotating pump geared to the wheel of the car pumps air through tubing of small diameter to a diaphragm increasing as the car speed increases and being converted into readings of miles per hour. A second line of tubing from the same pump gives a series of air impulses, a fixed number to the mile, and these impulses are recorded in terms of miles traveled by a ratchet on the odometer mechanism in the instrument. The two lines of tubing from the pump to the instrument are so small that they can be enclosed in the one flexible casing for the connection from the steering knuckle to the frame, and on the latter can be of fine copper tubing.

Formerly known as the Shipman, but now called the Cleveland, an instrument made in Sunbury, Pa., but marketed by the Cleveland Speed Indicator Co., of Cleveland, Ohio, attracts considerable show attention by reason of its construction. The speed readings result from the action of a clock mechanism in connection with a cam which determines the position of the indicating

hand at every thirtieth of a mile, there being no centrifugal or other balanced forces employed. A ratchet in the driving system from the steering knuckle prevents the device from being affected by running the automobile itself backward.

The Warner Instrument Co., of Beloit, Wis., not only mounts its magnetic Auto-Meters in numerous styles, but also lets visitors see the "horograph," the company's latest timing outfit for automobile races. The Stewart & Clark line is "multi-polar," the Veeder tachodometer represents the only liquid centrifugal instrument, while the Jones, Hoffer, Ever Ready and Star are mechanical centrifugal. The Casgrain operate on "liquid drag."

#### Signal Devices.

Reed horns operated by bulb pressure divide the field with signals operated electrically or by exhaust gas to a greater extent than ever before in the show representation. Three domestic makes of conventional bulb horns are on view as against half a dozen of the other types. The Klaxonet, a diminutive of the Klaxon and retailing at \$20, is the latest member of the ratchet diaphragm family produced by the Lovell-McConnell Mfg. Co., of Newark, N. J., and like its big brother is operated by a self-contained electric motor, although the company also makes manually operated Klaxons for special purposes. The Gabriel horns, which were pioneers in the exhaust horn division, have been further refined and improved by the Gabriel Horn Mfg. Co., of Cleveland, O., so that in a single tube a three-tone blend is secured, while keyboard equipment can be supplied for groups of single tone horns. The Jericho, of the Randall-Faichney Co., Boston, Mass., makes its first New York show appearance, being a simple exhaust horn of compact shape, while the Nightingale exhaust whistle, with variable tone according to how much a stop is pulled in or out, is a show veteran. The Sireno and the Jones exemplify the siren and the vibrating diaphragm types of electric horns.

#### Fittings and Supplies.

Five makes of shock absorber are demonstrated, including the Truffault-Hartford, Gabriel, Kilgore, Flentje and Sager, the last being new, while the others have been on the market for various periods. Two exhibits also have supplementary springs. A safety starting handle from Boston, made by the Hilton Mfg. Co., is shown, with the claim that it instantly releases in case of an engine backfire, but the demonstration is at times not so smooth as to be entirely convincing. Various forms of folding tonneau seats are disclosed by the Hill Mfg. Co., Buffalo, N. Y., and the Compact Co. New York.

Charles E. Miller, the New York jobber, importer, exporter and manufacturer, has a large square space with counters on four sides, all loaded with accessories and spe-

EXHIBIT OF THE UNITED MANUFACTURERS, INC.,

cialties, while the middle of the space is devoted to the more bulky displays of Brampton chains, shields and the like.

Hydraulic wind shields and Swivel-Action bumpers loom big at the space of the Emil Grossman Co., of New York City, where the Grossman ignition goods, including Red Head plugs and Red Rib cable also are found. Of greases, oils and special lubricants there is a surprisingly big array, almost a dozen exhibits of this nature being in evidence. These with valve grinding compounds, socket wrenches, small tools, renewal brake lining, packing and other goods of the same order serve to give great strength to the showing of supplies.

A worm effect-like that on some forms of taximeter drive marks the method used for raising and lowering the vertically moving rack member of the simple four-piece jack which the Oliver Mfg. Co., of Chicago, Ill., has brought to the show. The standard of the jack has an integral bearing stud for the worm wheel, the same stud also carrying the loose lever which turns the worm. Being loose, the lever can be thrown in or out of engagement with the teeth on the worm wheel. When the riser rack is inserted in the standard the worm and lever are prevented from moving inwardly off the stud which is their bearing. After the

four pieces of the jack have been assembled a small lug or tail on the standard is tapped with a hammer, being bent inward so that the rack cannot come out beyond its

OLIVER'S FOUR-PIECE WORM JACK.

fixed rise and therefore constituting a complete and permanent assembly.

A non-slop funnel, called the New Dover Automatic, is a new offering at the booth of the Dover Stamping & Mfg. Co., of Cambridge, Mass. It does not differ in ap-

pearance from other funnels save that at the bottom is a V shaped wire which extends the full length of the outside of the spout and continues a short distance beyond it, following the line of the funnel proper. From the lowest point of the wire to which it is attached, and passing upward through the spout is a rod having on its uppermost end a metal ball. Over the bottom of the funnel, at the point where the spout takes form, is a metal wall in which is contained the seat for the ball. The operation of the device consists only of inserting the funnel in a filler, which latter presses up on the wire and raises the ball from its seat. When the funnel is raised the weight of the various parts causes the ball to seat and stop the flow of the liquid, so that there is no flow or drip as the spout is removed from the filler opening. The funnel is made in three sizes, two, four and eight quart capacity, and is heavily copper plated.

To meet the demand for a storage stand which will relieve tires of the car weight during the winter months, when the car is out of service, there is being shown by the Elite Mfg. Co., of Ashland, O., a simple device, not unlike a jack, save that it has no lifting mechanism. The instrument consists of two parts, an upright stand with a ring at its top and an adjustable riser contain-

ing the arm. The riser, which passes through the ring, is toothed. When the car has been jacked up so that the tires are clear of the floor the stand is placed under it in such manner that the axle rests in the arm of the riser, which has been properly adjusted through the agency of the ring and teeth. The jack is then removed and when the same operation has been repeated at each wheel the tires are permanently relieved until the car is again in use. The stands are made of malleable iron, and sell

for \$3 for a set of four. Another form of the same device is shown which differs only in that the arm has a swivel and the saddle is leather faced and no jack is necessary as a lifting device is incorporated in the stand.

With a big plurality over every other class of exhibitor at the show, the concerns who primarily are seeking the business of automobile manufacturers for parts and materials are represented to the number of 50 or more. Their offerings range from en-

gines to Columbia locknuts and include, frames, axles, gears, radiators, brakes, clutches, brake linings, lubricators, dynamometers, hoods, levers, chains, bearings, bodies and all manner of castings and pressed steel work. Joseph Tracy, of New York, is the builder of the dynamometer, which is of the fan type and gives r.p.m. and direct horsepower readings on the indicator. The motor under test is mounted on a rocking cradle pulling against a spring balance as the crank shaft is revolved.

## Summary of Exhibitors and Their Exhibits

Allen-Kingston Motor Car Co., New York City.—A-K 4 cylinder shaft driven gasoline cars. One 35-40 h.p. torpedo, one 48 h.p. gun boat, one 15-20 taxicab. No radical change from last year.

American Motor Co., Brockton, Mass.—Near-makers of the Belmont gasoline car. Car not shown because of discovery that name conflicted with another car.

American Motor Car Co., Indianapolis, Ind.—American 4 cylinder shaft driven gasoline cars. One 50 h.p. chassis, one 50 h.p. roadster, one 50 h.p. traveler, one 50 h.p. touring car. New features: larger wheels on roadster, new spring suspension, new axles, larger brakes, flexible straight line drive. Distinctive features: underslung frame.

Atlas Motor Car Co., Springfield, Mass.—Atlas shaft drive gasoline cars. One 3 cylinder 20 h.p. taxicab, one 4 cylinder 60 h.p. touring car (new model), one 4 cylinder 30 h.p. touring car, one 4 cylinder 60 h.p. toy tonneau. Features: 2 cycle engine, built up crankshaft with counterweights.

Bartholomew Co., The, Peoria, Ill.—Glide 4 cylinder shaft drive gasoline cars. One 45 h.p. touring car, one 45 h.p. demi-tonneau. New features: 16 inches longer wheel-base on roadster, larger wheels, straight line drive, rear axle transmission, bevel steering gear, larger brakes.

B-C-K Motor Car Co., York, Pa.—Kline shaft driven gasoline cars. First time shown in New York City. One 6 cylinder 40-50 h.p. runabout, one 4 cylinder 24-30 h.p. pony tonneau, one 6 cylinder 40-50 limousine, one 6 cylinder 40-50 touring car. Features: separate cylinders united in block form, upswept frame, water jacketed inlet pipe.

Black Mfg. Co., Chicago, Ill.—Black-Crow gasoline cars. One 4 cylinder 35-40 h.p. chassis, one 4 cylinder 25-30 h.p. pony tonneau, one 4 cylinder 25-30 h.p. roadster. All new models. Features: Block engine one 25-30 h.p., cylinders in pairs of 35-40, long stroke motor, multiple clutch enclosed in fly-wheel, transmission on rear axle, upswept frame in rear with full elliptic springs, pressed steel front axle.

Sidney B. Bowman Co., New York City.—Clement-Bayard shaft driven gasoline cars. One 4 cylinder 20-30 h.p. chassis, one 4 cylinder 20-30 h.p. landaulet, one 4 cylinder 20-30 h.p. limousine, one 4 cylinder 15 h.p. town car, one 6 cylinder 25-35 h.p. touring car. New features: Bosch magneto standard.

Brewster & Co., New York City.—Delaunay-Bellville 6 cylinder shaft driven gasoline cars. One 15-25 h.p. chassis, one 25-40 h.p. semi-closed body, one 10-15 h.p. brougham, one 15-25 h.p. landaulet. No radical changes since last year.

Brush Runabout Co., Detroit, Mich.—Brush 1 cylinder chain drive gasoline cars. One

10 h.p. coupe, one 10 h.p. runabout, one 10 h.p. roadster, one 10 h.p. chassis. New features: six inches longer wheel-base, more power, larger clutch surface, selective control, balance gear in motor. Distinctive features: helical spring suspension and shock absorbers combined, wood axles, left hand steering, wood frame, unit transmission, double chain drive, vertical engine.

Buckeye Mfg. Co., Anderson, Ind.—Lambert 4 cylinder friction drive gasoline cars. One 28 h.p. touring car, one 28 h.p. chassis, one 35-40 h.p. touring car, two 35 h.p. touring cars. Features: Monobloc motor, greater braking surface, full elliptic rear springs, frame strengthened, heavier steering knuckles. Exclusive features: Mechanical motor starter operated from seat.

Cameron Car Co., Beverly, Mass., and New London, Conn.—Cameron air-cooled gasoline cars. One 6 cylinder 26 h.p. car, one 4 cylinder 24 h.p., "featherweight flyer," one 4 cylinder 24 h.p. surrey. New features: New valve actuating gear, new oiling system, full elliptic double scroll rear springs.

Cartercar Co., Pontiac, Mich.—Cartercars, 4 cylinder shaft drive. One 30-35 h.p. touring car, one 25 h.p. chassis, one 25 h.p. runabout, one 2 cylinder 24 h.p. taxicab, one 25 h.p. touring car. New features: Four cylinder engines, chain-enclosed running in oil. Distinctive features: Friction drive.

C. G. V. Import Co., New York City.—Charlton Limited gasoline cars. One 4 cylinder 12-14 h.p. chassis, one 4 cylinder 12-14 h.p. runabout, one 4 cylinder 16-20 h.p. chassis, one 4 cylinder 12-14 h.p. coupe and one 4 cylinder 12-14 h.p. inside driven coupe (new model). New features: Incased valves, thermo-syphon circulation, exclusively left side drive, with control levers in centre.

De Dion Bouton Selling Branch, New York City.—De Dion Bouton shaft driven gasoline cars. One 8 cylinder 50 h.p. chassis, one 4 cylinder 14 h.p. taxicab, one 4 cylinder 40 h.p. chassis, one 4 cylinder 10 h.p. runabout. New features: New carburetter, and new model V-type 8 cylinder engine.

Delahaye Import Co., New York City.—Delahaye 4 cylinder shaft driven gasoline cars. Two limousines.

Demot Motor Car Sales Co., Detroit, Mich.—Demot gasoline cars. First time shown in New York. One 2 cylinder opposed 10 h.p. runabout. Features: Unit power plant, planetary transmission of selective system, single lever control of speeds and brake.

Empire Motor Car Co., Indianapolis, Ind.—Empire 4 cylinder double chain drive gasoline cars. First time shown in New York City. One 20 h.p. roadster, one 20

h.p. runabout. Features: Block motor, incased driving chains, platform, rear springs, three-quarter elliptic front springs, gear shifting lever inside of frame.

Fal Motor Co., Chicago, Ill.—Fal gasoline cars. One 35-40 4 cylinder touring car. First time shown in New York City. New features: Wheel-base increased six inches to 116, rear spring suspension improved, transmission redesigned, and suspension changed, tilting steering post, heavier axles, larger rear tires and new motor, new force feed oiling system. Exclusive features: Motor suspension and tilting steering post.

Fiat Automobile Co., New York City.—Fiat gasoline cars. One 4 cylinder 15 h.p. shaft drive, four passenger runabout, one 4 cylinder 15 h.p. shaft drive, two passenger runabout, one 4 cylinder 15 h.p. shaft drive landaulet, one 4 cylinder 45 h.p. shaft drive Newport folding landaulet, one 6 cylinder 45 h.p. chain drive Newport body, one 6 cylinder 45 h.p. chain drive touring car, one 4 cylinder 45 h.p. shaft drive toy tonneau, one 4 cylinder 45 h.p. shaft drive gun boat, one 4 cylinder 200 h.p. chain drive racing car. Changes not found necessary.

Ford Motor Co., Detroit, Mich.—Ford 4 cylinder shaft drive gasoline cars. One 20 h.p. coupe, one 20 h.p. town car, one 20 h.p. runabout, one 20 h.p. tourabout, one 20 h.p. touring car. New feature: Thermo syphon cooling. Distinctive features: Block engine, magneto in fly-wheel, unit power plant, three point suspension, oiler in engine, transverse front and rear springs, left hand steering with wheel reduction gears.

Chadwick Engineering Works, Pottstown, Pa.—Chadwick 6 cylinder chain driven gasoline cars. One 60 h.p. chassis, one 60 h.p. touring car, one 60 h.p. racing runabout, one 60 h.p. close coupled, one 60 h.p. limousine. Features: New internal clutch, new oiling system, larger brakes, new steering gear, spiral magneto advance. Distinctive features: Copper jackets and chain cases, safety front spring leaf.

Coates-Goshen Co., Goshen, N. Y.—Goshen gasoline cars. One 4 cylinder 40-45 h.p. chassis (new model), one 4 cylinder 30-32 h.p. baby tonneau. New features: 30-32 h.p. car—heavier rear axle, double ignition, heavier drive shaft; 40-45 h.p.—straight line drive, with one slip joint instead of universal; transmission in waist, but integral with rear axle.

Cole Motor Car Co., Indianapolis, Ind.—Cole gasoline cars. One 30 h.p. 4 cylinder touring car, one 30 h.p. 4 cylinder runabout, one 30 h.p. 4 cylinder chassis. First time shown in New York City. Features: Unit power plant, full elliptic rear

springs, Firestone demountable rims, auxiliary gas and oil tanks, optional on runabout.

Columbus Buggy Co., Columbus, Ohio.—Firestone-Columbus gasoline and electric cars. One 4 cylinder 26 h.p. torpedo roadster, one 4 cylinder 35 h.p. touring car, one 5 h.p. electric coupe, one 5 h.p. electric victoria. Gasolene cars new models. Exclusive features: Design and application of rear shock absorbers, double drop frame. Features: One 25 h.p. model: Left hand steering, simplicity and accessibility.

Conte, Caesare, New York City.—S. P. A. gasolene cars. One 4 cylinder 18-25 chassis. New features: Two running brakes fore and aft of transmission, emergency differential locking device. Never shown before in New York City.

Crawford Automobile Co., Hagerstown, Md.—Crawford gasolene cars. One 4 cylinder 50 h.p. touring car, one 4 cylinder 24-28 h.p. touring car. New features: One 23-28 h.p.—longer wheel base, new motor; one 50 h.p.—longer wheel base, larger engine, shaft drive instead of chain, one additional speed, and larger wheels.

Dayton Motor Car Co., Dayton, Ohio.—Stoddard-Dayton 4 cylinder shaft drive gasolene cars. One 40 h.p. chassis, one 50 h.p. torpedo, one 50 h.p. touring car, one 50 h.p. limousine, one 30 h.p. landaulet. New features: Heavier frame construction throughout, two cam shafts with individual rocker arms for overhead valves on 40 and 50 h.p. models; 30 h.p. remains the same.

Fry, V. H., Detroit, Mich.—Seitz gasolene cars. Not shown.

Gaeth Automobile Co., Cleveland, Ohio.—Gaeth 4 cylinder gasolene cars. One 40-45 h.p. touring car, one 40-45 h.p. chassis, one 40-45 h.p. tourabout. New features: Six inches longer wheel-base, selective transmission.

Hol-Tan Co., The, New York City.—Lancia 4 cylinder shaft drive gasolene cars. One 20 h.p. chassis, one 20 h.p. touring car, one 20 h.p. landaulet, one 20 h.p. touring landaulet, one 20 h.p. limousine, one 20 h.p. inside driven coupe, one 12-18 h.p. town car. Features: On 20 h.p.—monobloc engine, oiling system contained in lower half of crankcase instead of on dashboard.

Hotchkiss Import Co., New York City.—Hotchkiss 4 cylinder gasolene shaft drive cars. One 20-30 h.p. touring car, one 16-20 touring landaulet. Features: Block motor on 16-20 h.p. car.

Hupp Motor Car Co., Detroit, Mich.—Hupmobile 4 cylinder shaft drive gasolene cars. One 20 h.p. chassis, one 20 h.p. runabout and one 20 h.p. fully equipped runabout. Features: Unit construction, larger radiator, multiple disc clutch.

Inter-State Automobile Co., Muncie, Ind.—Inter-State gasolene cars. One 4 cylinder 40 h.p. runabout, one 4 cylinder 40 h.p. toy tonneau, one 4 cylinder 40 h.p. chassis. Features: More power and longer wheel base, gear driven oil pump, improved clutch, larger brake drum surface, three-quarter elliptic rear spring. Novel features: Ball and socket joint transmission suspension, gear shift through flexible shaft.

Jackson Automobile Co., Jackson, Mich.—Jackson 4 cylinder shaft drive gasolene cars. One 30 h.p. touring car, one 40 h.p. touring car, one 40 h.p. 4 passenger roadster, one 50 h.p. chassis, one 50 h.p. touring car. New features: Ten inches increased wheel base in 50 h.p. model, overhead valves on 40 and 30 h.p. models.

Kissel Motor Car Co., Hartford, Wis.—

Kissel gasolene cars. One 4 cylinder 50 h.p. touring car, 4 cylinder 50 h.p. tonneau, one 4 cylinder 30 h.p. touring car. New features: Increased power, larger brakes, longer wheel base, foot throttles, gear shifting levers outside frame, one additional speed, new type radiator, new type foot accelerator double ignition, rear frame upswept, new method rear spring suspension.

Lion Motor Car Co., Adrian, Mich.—No models shown.

Maxwell-Briscoe Motor Co., The, Tarrytown, N. Y.; New Castle, Ind., and Providence, R. I.—Maxwell shaft drive gasolene cars. One 4 cylinder 22 h.p. toy tonneau, one 4 cylinder 22 h.p. chassis, one 4 cylinder 22 h.p. "Sportsman," one 4 cylinder 22 h.p. runabout, one 4 cylinder 30 h.p. detachable toy tonneau, one 4 cylinder 30 h.p. touring car, one 2 cylinder 12

THE FOUNTAIN IN THE PALACE.

h.p. chassis, one 2 cylinder 12 h.p. runabout. Features: 22 h.p. cars, new models—unit power plant, thermo syphon cooling system, multiple force feed oiler, double ignition; on 30 h.p. models—new multiple force feed oiler, wheel base lengthened from 104 to 110 inches, 34-inch wheels, refinement of body line. Distinctive features: Unit construction, three point suspension, thermo syphon cooling, double trussed rear axle.

McCue Co., The, Hartford, Conn.—McCue 4 cylinder shaft drive gasolene cars. One 40 h.p. chassis, one 40 h.p. touring car. Features: New engine, more power, brake equalizers, steering gear housing placed far forward with very short reach rod, radiator filler cap interchangeable with hub cap.

McIntyre, W. H., Auburn, Ind.—McIntyre gasolene cars. One 4 cylinder 30 h.p. chassis, one 4 cylinder 30 h.p. touring car, one 2 cylinder 20 h.p. runabout. New features: Larger engine, sliding transmission, pressed front axle, valves in head, adjustable pedal. New feature of 20 h.p. car: Water instead of air cooling. Exclusive feature: Air or water cooling optional.

Metz, C. H., Waltham, Mass.—Metz-Plan gasolene cars. One 12 h.p. 2 cylinder chassis, two 12 h.p. 2 cylinder runabouts. New features: Horse power increased, longer rear springs. Exclusive features: Detachable reversible wire wheels, giving double tread; group assembling construction of parts.

Metzger Motor Car Co., Detroit, Mich.—

Everitt 4 cylinder shaft drive gasolene cars. One 30 h.p. toy tonneau, one 30 h.p. chassis, one 30 h.p. touring car. First time shown in New York City. Features: Block motor, double drop frame, selective transmission integral with rear axle, cylinders and upper half of crank case integral.

Middleby Automobile Co., Reading, Pa.—Middleby air cooled cars. One 4 cylinder 25 h.p. toy tonneau, one 4 cylinder 25 h.p. runabout. New features: Heavier wheels, longer front and rear springs, new type steering knuckles, three speeds, progressive transmission, new carburetter, larger oiler and larger auxiliary exhaust ports. Exclusive feature: Auxiliary exhaust.

Midland Motor Co., Milone, Ill.—Midland 4 cylinder shaft drive gasolene cars. One 40 h.p. toy tonneau, one 40 h.p. touring car. New features: Unit power plant, pressed front axle, straight line drive, flexible trunion motor suspension, large brakes, pressed rear axle, self-finding inter-locking change gear.

Mitchell Motor Car Co., Wis.—Mitchell gasolene shaft drive cars. One 4 cylinder 30-35 h.p. 5 passenger touring car, one 4 cylinder 30-35 h.p. three or four passenger roadster, one 6 cylinder 50 h.p. 7 passenger touring car, one 6 cylinder 50 h.p. chassis. New features: Improved engine construction, making for more silent running; design altered, shape of radiator changed, three-quarter elliptic springs and full platform springs on 7 passenger 6 cylinder car, which is a new model; full floating rear on 5 passenger car instead of semi-floating axle, larger brake drum surface, no universal joints in driving shaft, which is enclosed; transmission integral with rear axle. General refinements, among which might be mentioned change of color from light blue to blue-black with cream running gear.

Moline Automobile Co., East Moline, Ill.—Moline 4 cylinder shaft drive gasolene cars. One 30 h.p. toy tonneau, one 30 h.p. touring car. New features: Larger engine, three inches longer wheel base. Features: Unit power plant.

Moon Motor Co., St. Louis, Mo.—Moon 4 cylinder shaft drive gasolene cars. One 30 h.p. toy tonneau, one 30 h.p. touring car, one 30 h.p. chassis, one 45 h.p. toy tonneau; 30 h.p. cars are new models. Features: Expanding metal to metal clutch, rear axle transmission, drive with ball and socket joints, straight line, universal joints. Changes on 45 h.p.: Larger engine and longer wheel base, overhead cam shaft.

Mora Co., The, Newark, N. Y.—Mora 4 cylinder shaft drive cars. Two 35 h.p. touring cars, one 35 h.p. tourer, one 35 h.p. limousine, one 35 h.p. chassis, one 4 cylinder 20 h.p. runabout (new model). Features: Valves in the head, dash radiator, thermo syphon cooling, frame upswept rear, rear platform springs. Features of 35 h.p.—Longer springs, two independent systems of ignition, platform rear springs. Distinctive features: Unit power plant, adjustable pedals.

National Motor Vehicle Co., Indianapolis, Ind.—National shaft drive gasolene cars. One 40 h.p. chassis, one 40 h.p. toy tonneau, one 40 h.p. Speedway model, one 40 h.p. touring car. New features: Larger engine, longer wheel base, three-quarter elliptic rear springs, heavier axles, larger brakes, larger wheels.

Nordyke & Marmon, Indianapolis, Ind.—Marmon 4 cylinder shaft drive gasolene cars. One 32 h.p. chassis, one 32 h.p. touring car, one 32 h.p. torpedo, one 32 h.p. Vanderbilt racer. New features: Four inches longer wheel base, I-beam front axle. Exclusive features: Oiling system.

pressed steel rear axle, transverse attachment of rear shock absorbers.

Oakland Motor Car Co., Pontiac, Mich.—Oakland 4 cylinder shaft drive gasoline cars. One 40 h.p. touring car, one 40 h.p. touring car, one 40 h.p. runabout, one 30 h.p. runabout, one 30 h.p. touring car, one 30 h.p. chassis, 30 h.p. new model. Features: Unit power plant, full elliptic springs, straight line drive with slip instead of universal joint. Features of 40 h.p.: Rear full elliptic springs, straight line drive without universal joints, removable cylinder caps for cleaning piston.

Ohio Motor Car Co., Cincinnati, Ohio.—Ohio 4 cylinder shaft drive cars. First time in New York City. One 35-40 chassis, one 35-40 h.p. touring car. Features: Unit power plant, straight line drive, large brakes, pressed front axle.

Otto Gas Engine Works, Philadelphia, Pa.—Otto gasoline cars. One 35 h.p. 4 cylinder chassis, one 35 h.p. 4 cylinder runabout, one 35 h.p. 4 cylinder touring car. First time shown in New York City. All new models. Features: Transmission on rear axle, double ignition, floating drive shaft throughout, novel torque rod arrangement, relieving possible cramping of the transmission; distinctive clutch and gear-shifting linkage; Firestone demountable rims.

Paige-Detroit Motor Car Co., Detroit, Mich.—Paige-Detroit gasoline cars. One 3 cylinder 2 cycle 25 h.p. chassis, one 3 cylinder 2 cycle 25 h.p. runabout. First time shown in New York City. Features: Unit power plant, 2 cycle engine, very large water manifolds, fly-wheel in front.

Panhard & Levassor, New York City.—Panhard gasoline cars. One 4 cylinder 13 h.p. shaft drive chassis (new model), one 6 cylinder 35 h.p. double chain drive touring car, one 4 cylinder 25 h.p. shaft drive brougham, one 4 cylinder shaft drive collapsible brougham, one 4 cylinder 25 h.p. shaft drive collapsible brougham. New feature of 14 h.p.: Motor cast in block.

Paterson Co., W. A., Flint, Mich.—Paterson gasoline cars. One 30 h.p. 4 cylinder touring car, one 30 h.p. 4 cylinder demi-touring car, one 30 h.p. 4 cylinder double-rumble runabout. First time shown in New York City. All new models. Features: Unit power plant, double ignition, thermo syphon cooling.

Pennsylvania Auto Motor Co., Bryn Mawr, Pa.—Pennsylvania shaft drive gasoline cars. One 6 cylinder 75 h.p. chassis, one 4 cylinder 25 h.p. chassis, one 4 cylinder 25 h.p. touring car, two 4 cylinder 50 h.p. touring cars. Features on 75 h.p.: Valves in head, upswept rear frame, three-quarter rear elliptic springs, transmission on rear axle, large brakes. On 25 h.p.: Longer wheel base, new engine suspension.

Pierce Motor Co., Racine, Wis.—Pierce-Racine 4 cylinder shaft drive gasoline cars. First time in New York City. One 30 h.p. chassis, one 30 h.p. touring car, one 30 h.p. runabout. Standard construction.

Premier Motor Mfg. Co., Indianapolis, Ind.—Premier shaft drive gasoline cars. One 6 cylinder 60 h.p. touring car, one 4 cylinder 40 h.p. roadster, one 4 cylinder 40 h.p. chassis, one 4 cylinder 40 h.p. Clubman, one 4 cylinder 40 h.p. touring car. New Features on 60 h.p.: Larger engine, 15 inches longer wheel base, new front springs and method of suspension, larger wheels. New features of 40 h.p.: Larger engine. Distinctive features: Make and break ignition.

Quinby & Co., J. M., Newark, N. J.—Isotta Fraschini 4 cylinder chain or shaft drive gasoline cars. One 45 h.p. chassis, one

SIMPLEX MOTOR CAR CO.'S EXHIBIT.

30 h.p. chassis, one 20 h.p. toy tonneau, one 14 h.p. Voiturette, one 30 h.p. limousine, one 4 passenger "Quinby Limited" body with top and glass front. No radical changes from last year.

Regal Motor Car Co., Detroit, Mich.—Regal 4 cylinder gasoline cars. One 30 h.p. chassis, one 30 h.p. touring car, one 30 h.p. toy tonneau, one 40 h.p. touring car (new model). Changes on 30 h.p.: Two inches longer wheel base, transmission on rear axle, upswept rear frame, thermo syphon cooling.

Renault Freres Selling Branch, New York City.—Renault shaft drive gasoline cars. One 4 cylinder 25-35 h.p. chassis (new model), one 4 cylinder 20-30 h.p. limousine, one 4 cylinder 35-45 h.p. touring car, one 6 cylinder 18-24 h.p. chassis (new model), one 4 cylinder 10-12 h.p. chassis (new model), one 4 cylinder 12-16 h.p. chassis, one 2 cylinder 8-10 h.p. inside driven voiturette. Features: 25-35 h.p. model especially built for American roads, with 10 inches front axle clearance, liquid shock absorbers, dash radiator with thermo syphon cooling. On 18-24 h.p. 6 cylinder: Cylinders cast in triple, four speeds with direct drive on high speed. On 10-12 h.p.: Monobloc engine. On 12-16 h.p.: Curved frame.

Reo Motor Car Co., Lansing, Mich.—Reo gasoline cars. One 1 cylinder 10 h.p. runabout, one 2 cylinder 20 h.p. touring car, one 4 cylinder 30-35 h.p. touring car (new model), one 4 cylinder 30-35 h.p. roadster (new model), one 4 cylinder 30-35 h.p. chassis (new model), one 4 cylinder 30-35 h.p. limousine (new model). Changes in 1 and 2 cylinder machines: Longer stroke engine. Features of 30-35 h.p.: Valves in head, bevel steering gear on left side, long stroke motor, mechanically driven pump oiler in engine.

Schacht Mfg. Co., Cincinnati, Ohio.—Schacht 2 cylinder chain drive gasoline cars. One 22-24 h.p. runabout, one 22-24 h.p. half ton delivery wagon (new models). Features: Horizontally opposed motor lengthwise in frame, interchangeable high or low wheels, cone and disc clutch, planetary transmission on jacket-shaft amidship, triple chain drive, with independent adjustment.

Simplex Motor Car Co., Mishawaka, Ind.—American Simplex 4 cylinder shaft drive gasoline cars. One 30-50 h.p. chassis, one 30-50 h.p. touring car, one 30-50 h.p. limousine, one 30-50 h.p. pioneer roadster, one 30-50 h.p. close coupled. New feature:

Radiator. Other features: Continuation of design without change from original model, 2 cycle engine, rear axle transmission.

Speedwell Motor Car Co., Dayton, Ohio.—Speedwell 4 cylinder shaft drive gasoline cars. One 50 h.p. chassis, one 50 h.p. torpedo, one 50 h.p. roadster, one 50 h.p. 7 passenger touring car. New features: Larger wheels and springs, drop frame, split rear axle housing, permitting removal of differential.

Staver Carriage Co., Chicago, Ill.—Staver gasoline cars. One 30 h.p. 4 cylinder touring car. First time shown in New York City. Standard design throughout.

Streator Motor Car Co., Streator, Ill.—Halladay 4 cylinder shaft drive gasoline cars. One 30 h.p. touring car, one 40 h.p. touring car, one 24-28 h.p. roadster. New features: Six inches longer wheel base on roadster, new front axle, three speed selective transmission, double instead of single brakes, larger engine, lower frame suspension; 30 h.p. car new model. Some of the features are pressed steel front axle, unit clutch and transmission, inclosed brakes, full floating rear axle.

Sultan Motor Co., New York City.—Sultan 4 cylinder shaft drive gasoline cars. One 12-15 h.p. town car, one 12-15 h.p. power plant. Features: Interchangeable quick detachable power plant, new oiler, large water capacity, telescopic quick detachable venturi tube carburetter.

York Motor Car Co., York, Pa.—Pullman 4 cylinder shaft drive gasoline cars. One 35 h.p. limousine, one 28 h.p. runabout (new model), one 50-60 h.p. touring car, one 35 h.p. toy tonneau, one 35 h.p. touring car. New features on 50 h.p.: Larger engine, also on 35 h.p., cylinders cast in pairs and joined in block form. On 28 h.p. car: Cylinders cast separately and joined in block form.

#### Commercial Vehicles.

American Motor Truck Co., Lockport, N. Y.—American gasoline commercial vehicles. One 4 cylinder 60 h.p. 5 ton chassis, one 4 cylinder 45 h.p. 1½ ton express wagon. Features: Larger engine, larger brakes, double ignition, new brake equalizers, unit clutch and transmission, optional sliding or planetary transmission, three point transmission suspension, platform rear springs, interchangeability of parts, armored frame.

Carlson Motor & Truck Co., Philadelphia, Pa.—Carlson gasoline commercial ve-

THE NORDYKE &amp; MARMON DISPLAY.

hicles. First time in New York City. One 4 cylinder 30 h.p. 3 ton chassis. Features: Interchangeable and quick detachable power plant, 4 cylinder horizontal double opposed engine, hinged connecting rods in pairs on two throw cranks quick detachable, steering gear amidship with double reach rods, reducing vibration on steering wheel; double chain drive, combination planetary sliding transmission, provision for sealing governor to prevent driver exceeding predetermined speed.

Chase Motor Truck Co., Syracuse, N. Y.—Chase gasoline commercial vehicles. One 3 cylinder 20 h.p. delivery wagon, one 3 cylinder 25 h.p. delivery wagon. Features: Air cooling, two cycle engine, accessibility.

DeDion Bouton Selling Branch, New York City.—DeDion Bouton 4 cylinder commercial vehicles. One 4 cylinder 18 h.p. 4 ton truck, one 4 cylinder 24 h.p. 42 passenger Fifth avenue bus chassis. Features: Rear axle transmission.

Grabowsky Power Wagon Co., Detroit, Mich.—Grabowsky 2 cylinder double chain drive commercial vehicles. One 30-35 h.p. 1 ton delivery wagon, one 30-35 h.p. 1 ton chassis, one 30-35 2 ton chassis, one 40-45 3 ton stake truck. Features: Interchangeable and quick detachable power plant, accessibility.

Gramm-Logan Motor Car Co., Chillicothe, Ohio.—Gramm-Logan 4 cylinder shaft drive gasoline commercial vehicles. One 35 h.p. 1½ ton chassis, one 45 h.p. 3 ton refrigerator wagon, one 25 h.p. 1½ ton delivery wagon. Features: Sliding spring shackle rolls, multiple disc clutch, new engine in 45 h.p.; 25 h.p. new model.

Hart-Kraft Motor Co., York, Pa.—Hart-Kraft chain drive gasoline commercial vehicles. One 2 cylinder 16 h.p. delivery wagon, one 2 cylinder 16 h.p. hotel bus, one 2 cylinder 16 h.p. closed delivery wagon. Features: Unit power plant on ball bearings, accessibility.

Lansden Company, The, Newark, N. J.—Lansden electric commercial vehicles. Three 1½ ton delivery wagons, one 2 ton warehouse truck. Features: Sectional chassis construction, non-leakable non-destructible batteries, triple chain drive. Exclusive features: Dock truck with hinged central platform, two wheeled dock truck with auxiliary balance wheels, removable steering apparatus for either end.

Mack Bros. Motor Car Co., Allentown, Pa.—Manhattan gasoline commercial vehicles.

One 4 cylinder 50 h.p. 16 passenger bus, one 50 h.p. 5 ton stake truck, one 50 h.p. 3 ton stake truck. Standard construction. Martin Carriage Works, York, Pa.—Martin gasoline commercial vehicles. Two 18 h.p. 2 cylinder delivery wagons, one 14 h.p. 2 cylinder delivery wagon. First time in New York City. Features: Opposed engine unit power plant, combination radiator and gasoline tank on dash, accessibility of mechanism and ease of dismounting power plant.

Otto, Albert T., New York City.—Saurer gasoline commercial vehicles. One 4 cylinder 30 h.p. double chain drive 4 ton truck. Features: Self-starter, air brake, 42 inch rear twin driving wheel, governor. Randolph Motor Truck Co., Chicago, Ill.—Randolph gasoline commercial vehicles. One 2 cylinder 22 h.p. 1 ton chassis, one 2 cylinder 22 h.p. 1 ton delivery wagon. Chassis model new. Drop frame, selective transmission, full elliptic springs. Delivery wagon: More power, longer wheel base, double ignition and new clutch.

Rapid Motor Vehicle Co., Pontiac, Mich.—Rapid gasoline commercial vehicles. One 2 cylinder 24 h.p. 1 ton chassis, one 4 cylinder 45 h.p. 3 ton chassis, one 4 cylinder 60 h.p. 5 ton stake truck, one 2 cylinder 24 h.p. ambulance, one 2 cylinder 30 h.p. Pullman wagon, one 2 cylinder 24 h.p. 1 ton delivery wagon, two 2 cylinder 24 h.p. 3 ton express wagons, one 2 cylinder 24 h.p. 2 ton furniture wagon. Features: Heavy construction, two cylinder horizontal opposed engines, and four cylinder vertical engines, accessibility of power plant.

Reliance Motor Truck Co., Owosso, Mich.—Reliance gasoline commercial cars. One 3 cylinder 45 h.p. 3½ ton truck. Features: 2 cycle engine, simplicity and accessibility of mechanism.

## ACCESSORIES.

### First Balcony.

Ajax-Grieb Rubber Co., New York City (188)—Ajax tires.

American Ball Bearing Co., Cleveland, O. (124)—Ball bearings and axle equipments.

American Electrical Novelty & Mfg. Co., New York City (161)—Ever Ready batteries, lamps and tire specialties.

Atwater-Kent Mfg. Works, Philadelphia, Pa. (143)—Igniters and timers.

Atwood Castle Co., Amesbury, Mass (173)—Lamps.

Auto Improvement Co., New York City

(162)—Self starting devices and motor specialties.

Badger Brass Mfg. Co., Kenosha, Wis. (117)—Solar lamps and acetylene generators.

Baldwin Chain Mfg. Co., Worcester, Mass. (165)—Baldwin chains and recoil checks.

Batavia Rubber Co., Batavia, N. Y. (108)—Batavia tires.

Bowser & Co., S. F., Ft. Wayne, Ind. (121)—Gasolene and oil storage systems.

Breeze Carburetter Co., Newark, N. J. (152)—Carburetters.

Briscoe Mfg. Co., Detroit, Mich. (128)—Radiators and fittings.

Brown-Lipe Gear Co., Syracuse, N. Y. (107)—Transmissions, differential and steering gears.

Byrne, Kingston & Co., Kokomo, Ind. (136)—Kingston carburetters, mufflers and pumps.

Chase & Co., L. C., Boston, Mass. (199)—Top and cover leathers.

Coes Wrench Co., Worcester, Mass. (170)—Adjustable wrenches.

Columbia Nut & Bolt Co., Bridgeport, Conn. (123)—Lock nuts.

Consolidated Rubber Tire Co., New York City (174)—Tires.

Continental Caoutchouc Co., New York City (191)—Continental tires and rims.

Cook's Sons, Adam, New York City (140)—Lubricants and lubricators.

Cramp & Sons, Wm., Ship & Engine Building Co., Philadelphia, Pa. (146)—Bronze and bearing metal castings.

Dayton Rubber Mfg. Co., Dayton, O. (201)—Airless tires.

Diamond Chain & Mfg. Co., Indianapolis, Ind. (129)—Chains and sprockets.

Diamond Rubber Co., Akron, O. (110)—Diamond tires.

Dietz & Co., R. E., New York City (180)—Lamps.

Dixon Crucible Co., Joseph, Jersey City, N. J. (171)—Graphite and lubricants.

Driggs-Seabury Ordnance Corp., Sharon, Pa. (185)—Crank shafts and frames.

Edmunds & Jones Mfg. Co., Detroit, Mich. (153)—Lamps and specialties.

Electric Storage Battery Co., Philadelphia, Pa. (184)—Accumulators.

Empire Tire Co., Trenton, N. J. (183)—Empire tires, brake lining and steering wheel grips.

Excelsior Motor Mfg. Co., Chicago, Ill. (176)—Motors.

Firestone Tire & Rubber Co., Akron, O. (113)—Firestone pneumatic and solid tires.

Fisk Rubber Co., Chicopee Falls, Mass. (120)—Fisk tires.

Fox Metallic Tire Belt Co., Brooklyn, N. Y. (203)—Non-skid chains.

G & J Tire Co., Indianapolis, Ind. (103)—G & J tires.

Gabriel Horn Mfg. Co., Cleveland, O. (175)—Gabriel exhaust horns and Foster shock absorbers.

Gemmer Mfg. Co., Detroit, Mich. (177)—Steering gears and parts.

Gilbert Mfg. Co., New Haven, Conn. (164)—Tire jackets, lamp covers and rubber cloth specialties.

Goodrich Co., B. F., Akron, O. (118)—Goodrich clincher tires.

Goodyear Tire & Rubber Co., Akron, O. (101)—Goodyear tires and compressed air inflators.

Gray & Davis, Amesbury, Mass. (102)—Lamps.

Hall Lamp Co., C. M., Detroit, Mich. (167)—Lamps.

Hartford Rubber Works Co., Hartford, Conn. (115-116)—Hartford tires.

Hartford Suspension Co., Jersey City, N. J. (196)—Truffault-Hartford shock absorbers.

Goodrich Co., B. F., Akron, O. (118)—Goodrich clincher tires.

Goodyear Tire & Rubber Co., Akron, O. (101)—Goodyear tires and compressed air inflators.

Gray & Davis, Amesbury, Mass. (102)—Lamps.

Hall Lamp Co., C. M., Detroit, Mich. (167)—Lamps.

Hartford Rubber Works Co., Hartford, Conn. (115-116)—Hartford tires.

Hartford Suspension Co., Jersey City, N. J. (196)—Truffault-Hartford shock absorbers.

Duffy Grease Co., New York City (375)—Lubricants.

Ducasse & Co., Henry, New York City (333)—Repair cabinets.

Elite Mfg. Co., Ashland, O. (324)—Jacks and pumps.

Flentje, Ernest, Cambridge, Mass. (329)—Shock absorbers.

Fried, Ostermann & Co., Rockford, Ill. (403)—Gloves and gauntlets.

Frasse & Co., P. A., New York City (402)—Tubing, forgings and nickel steels.

Garage Equipment Co., Milwaukee, Wis. (365)—Specialties, timers, cut-out valves.

Gasolene Motor Efficiency Co., Jersey City, N. J. (340)—"Homo" mixer.

Geisler Bros., New York City (320)—Storage batteries.

Gibney & Bro., J. L., Philadelphia, Pa. (302)—Gibney wireless tires, electric vulcanizers.

Grossman Co., Emil, New York City (315)—Red Head spark plugs, Red Rib ignition cable and hydraulic wind shields.

George A. Haws, New York City (352)—Panhard oil.

High Frequency Ignition Coil Co., Los Angeles, Cal (336)—Ignition systems.

PREMIER "6-60" SEVEN-PASSENGER TOURING CAR.

TWO-CYCLE AMERICAN SIMPLEX TOURING CAR

Hill Mfg. Co., Buffalo, N. Y. (377)—Tops, seats and wind shields.

Hilton Mfg. Co., Boston, Mass. (396)—Safety starting device.

Howard Demountable Rim Co., Trenton, N. J. (397)—Howard demountable rims.

Hydraulic Oil Storage Co., New York City (339)—Fuel and oil tanks.

Ideal Windshield Co., New York City (334)—Wind shields.

International Engineering Co., New York City (406)—Annular ball bearings.

Johns-Manville Co., H. W. New York City (358)—Asbestos packing and gaskets.

Johnson & Co., Isaac G., Spuyten Duyvil, N. Y. (368)—Steel and nickel copper alloy forgings and castings.

Kells Mfg. Co., New York City (386)—Radiators.

Keystone Lubricating Co., Philadelphia, Pa. (301)—Lubricants.

Kilgore Mfg. Co., Boston, Mass. (385)—Shock absorbers.

Lavalette & Co., New York City (344)—Magnetos.

L. A. W. Motors Co., Providence, R. I. (378)—Rotary 2-cycle motors.

Livingston Radiator & Mfg. Co., New York City (314)—Radiators.

Lavigne Mfg. Co., Detroit, Mich. (372)—Lubricators.

Lutz-Lockwood Co., New York City (353)—S-X magnetos and dry cells.

Merchant & Evans Co., Philadelphia, Pa. (328)—Multiple disc clutches and automobile fittings.

Metal Stamping Co., New York City (364)—Wind shields, radiators, lamp brackets, tool boxes, horns and top hardware.

Meyers, A. J., New York City (359)—G. & A. carburettors.

Miller, Charles E., New York City (322)—Brampton chains, supplies and accessories.

Morrison-Ricker Co., Grinnell, Ia. (410)—Gloves and gauntlets.

Miller, Sons, W. P., Long Island City, N. Y. (326)—Lubricants.

Moller & Schumann Co., Brooklyn, N. Y. (398)—Varnishes.

Motor Parts Co., Plainfield, N. J. (381)—Auto-Cle wrenches and metal steps.

N. J. Car & Spring Co., Jersey City, N. J. (360)—Carpringo tires.

Newmastic Tire Co., New York City (383)—Tire filling compound.

New York Coil Co., New York City (390)—Spark coils.

Nightingale Whistle Co., New York City (332)—Nightingale whistles and circulatory pumps.

Nilmelior Electrical Co., New York City (404)—Magnetos.

Nonpareil Horn Mfg. Co., Brooklyn, N. Y. (338)—Horns.

Noonan Tool & Machine Co., Rome, N. Y. (379)—Tools.

Osborn Electric Co., Detroit, Mich. (400)—Coils.

Perfection Spring Co., Cleveland, O. (401)—Springs.

Polson, W. F., Buffalo, N. Y. (356)—Wind shields.

Prosser & Son, Thomas, New York City (337)—Krupp steel, gears and parts.

Raimes & Co., New York City (374)—Globe metal polish.

R. I. V. Co., New York City (347)—Annular ball bearings.

Rothstein Mfg. Co., New York City (341)—Hercules valve lifting tools and iron and brass specialties of all kinds.

Rushmore Dynamo Works, Plainfield, N. J. (349)—Acetylene lamps and generators.

Rutherford Rubber Co., Rutherford, N. J. (354)—Sterling tires.

Salman, John A., Boston, Mass. (387)—Brass monograms.

Shipman Instrument Co., Sunbury, Pa. (317)—Speed indicators.

Sireno Co., New York City (388)—Electric horns.

Siro Carburetter Co., Springfield, Mass. (399)—Carburettors.

Smith, Fred W., Aberdeen, S. D. (382)—"Point" spark plugs.

Standard Leather Washer Co., Newark, N. J. (369)—Leather washers, blow out patches and leather specialties.

Standard Metalwork Co., Thompsonville, Conn. (373)—Pipe coils and manifolds.

Stanley & Patterson, New York City (345)—Battery holders.

Star Speedometer Co., Danville, Pa. (346)—Speedometers.

Stevens Co., New York City (395)—Keno tire pump connections and rotary tire pumps.

Stewart Automobile Academy, New York City (342)—School.

Supplementary Spiral Spring Co., New York City. (391)—Supplementary spiral springs.

Touring Club of America, New York City—Tours and Jones' live map.

Tracy, Joseph, New York City (331)—Testing instruments.

Traver Mfg. Co., P. C., Far Rockaway, N. Y. (392)—Traver non-skid device.

Troy Carriage Sunshade Co., Troy, O. (351)—Tops and Troy pneumatic speedometer.

Tuttle Co., D. M., Canastota, N. Y. (405)—Transmissions.

Union Battery Co., Belleville, N. J.—Batteries.

Vanadium Metals Co., Pittsburg, Pa. (355)—Vanadium alloys.

Vehicle Apron & Hood Co., Columbus, O. (409)—Tire trunks and cases.

Wayne Oil Tank & Pump Co., Ft. Wayne, Ind. (363)—Gasolene storage tanks.

Westinghouse Companies, Boonton, N. J. (367)—Electric motor, battery and charging outfits.

Y. M. C. A., New York City (394)—School.

MAXWELL MODEL "G" RUNABOUT.

MAXWELL MODEL "E" TOURING CAR.

## The Garden Show and What It Will Offer

In one day New York's automobile show scene of action will be transported from a "trellis garden" to a "Roman amphitheatre," where a \$30,000 decorative layout is provided as a setting for the exhibits. The change takes place in the interval between the closing of the Palace show on Friday night and the opening of the show in Madison Square Garden on Saturday. It is best

tion of the almost severely simple arrangement which prevailed a year ago, subordinating the exhibits themselves, which in the majority of instances have become beautiful enough to compensate in the total. Ornamental lamp posts on the main floor and elevated platform again serve as signs giving the exhibitors' names.

What is described as "one of the most

ranged for at the Palace, but last week the Metzger company acquired the Hewitt Motor Co., of New York, a licensed member, and will utilize the Hewitt space again to put the Everitt on view, thus accomplishing something unparalleled in the history of New York's automobile shows.

The gasoline and steam pleasure cars occupy the main floor and part of the elevated

DECORATIVE TREATMENT OF MADISON SQUARE GARDEN FOR THE A. L. A. M. SHOW.

referred to as the "Garden show," since there is not the same reason for distinguishing it as the "Licensed" show that once existed. "Licensed" cars no longer being unknown at the Palace, owing to the many recent additions to the "Licensed" ranks. Nevertheless, the Garden is "Licensed" from stem to gudgeon in relation to its exhibits of gasoline cars.

This year the Garden will hold 323 exhibits as against 298 a year ago, there being 54 cars as against the 40 of last January. The accessory exhibitors, too, are greater in number than ever before, the ranks being 243 strong, which exceeds by 4 the record established then. Similarly the "motor-cycle section" embraces 23 exhibits as compared with the 19 of twelve months ago.

It is such a big show and so taxes the Garden's capacity, that no bulky or massive decorative effects are practicable, and this year's scheme is a white and gold modifica-

pretentious displays of automobile trophies ever given in America" has been prepared as an exhibit of a general nature which is likely both to gratify the eye and give visitors the satisfaction of feeling that they know by observation the actual appearance of many famous race prizes. Among the latter are the Vanderbilt cup, the Glidden tour prizes, the Indiana trophy, the Massapequa cup, the Merrimack Valley cup, Brighton Beach trophies, the Dewar cup, the Sewell-Alden, Tanforan, Thermoid, Lowell, Fairmount Park, Detroit trophies and the Dead Horse Hill Climb cup.

With one interesting exception, the cars all are making their first actual 1910 show appearance. The exception is the Everitt car, which through unusual circumstances enjoys the distinction of appearing at the Palace and the Garden successively. Its makers were the Metzger Motor Car Co., and were unlicensed when space was ar-

ranged for at the Palace, but last week the Metzger company acquired the Hewitt Motor Co., of New York, a licensed member, and will utilize the Hewitt space again to put the Everitt on view, thus accomplishing something unparalleled in the history of New York's automobile shows. The gasoline and steam pleasure cars occupy the main floor and part of the elevated

platform, while the electric pleasure vehicles again are grouped in the exhibition hall at the right of the entrance corridor. The commercial vehicles are in the basement, as before, sharing it with the motorcycle section and with those of the accessory exhibitors who could not be accommodated in the concert hall, and in the balconies and galleries around the main arena. The basement has a further attraction in a "Dutch Colonial Inn," the interior of which represents an old tavern, the semblance being carried out in kind of entertainment the inn provides.

The show committee consists of Col. George Pope and Charles Clifton, with Merle L. Downs, its secretary. Its work is hardly ended for one show when it commences preparations for that of the succeeding year, and this year's exhibition is graced by the fruition of hard work that started months ago.

Sensational developments in the way of new cars, new models, or new ideas applied to cars which already are familiar, no longer are listed among the expectations which foreshadow the Garden show. Products of the veteran manufacturers are displayed in refined and standardized form, thus lending to the exhibition a character peculiar only to itself among the entire list of automobile fixtures. Refinements, alterations in style, capacity and general character, as well as abundant tokens of fashion in the external elements of the vehicles are features of the show. Liquid-air engines, turbine mufflers, folding bodies and flying attachments, however, are barred. Basically,

COL. GEORGE POPE.

the Garden furnishes a show, not of promise, but of accomplishment.

At the same time, visitors will not be permitted to carry away the impression that standardization, of which much will be heard, has been permitted to run riot to the complete and everlasting extinction of variety. On the contrary, practically every conceivable shape and style of car which use has sanctioned or changing conditions demanded, will be on view. Despite the assertion that "world-beating" achievements of the gold-from-the-sea-water order will be lacking, not a few radical developments will be on view.

For example, among the disclosures in body construction will be several examples of the new and striking torpedo style. Whether yclept gunboat, battleship, bath, torpedo or bomb, these new bodies reveal distinctive lines, suggestions of speed and security, freedom from dust and immunity from flying mud. They range in form all the way from the true man-o-war type, to the modified touring car with high-sided body and side doors enclosing the front

seats. Some of them as well, offer more or less intricate problems as to the polite and graceful means of entrance and egress. For the most part, they are regarded as a hopeful development of a useful though somewhat restricted nature.

In mechanical developments, probably the most striking feature will be the new cool-

CHARLES CLIFTON.

ing system which has been applied to the Franklin power plant. In conjunction with the concentric valve and auxiliary exhaust principles, which have been standard elements in this distinctive product for several years, it may be considered the most radical, as well as one of the most staunchly upheld of all the licensed products. The Elmore, an old-time, and frequently almost solitary adherent of the two-cycle principle of engine operation, not only continues to prosper in that line of effort, but now is to disclose a new power unit of improved pattern and designated inspiringly as a high duty engine. Among minor improvements of noteworthy significance, may be mentioned the first appearance at any show of the dry plate clutch, so-called. This is a variation of the multiple disc principle, from which the sometime troublesome element of lubrication difficulty has been eliminated, as is thought, by the adaptation of special combinations of material. Stearns and Packard cars will show this feature among other improvements. In other lines, striking ingenuity and high engineering skill will be manifest in new directions. Indeed, it is known that one or two of the better-known manufacturers have been experimenting along strikingly radical lines, though no announcement to the effect that the fruits of such efforts will be exhibited at the Garden has yet been "released" to the public.

Sundry changes and additions in the membership of the A. L. A. M. which have occurred since the last show will result in a number of changes in apparent status, as well as provide for the appearance of several cars which have not before been exhibited at licensed shows. Although White steamers have occupied stands at several of the Garden exhibitions, they will now appear on a slightly different basis, together with the new White gasoline cars, through the production of which the White company has been enabled to secure membership in the association. Palmer & Singer cars will be exhibited under their own li-

MERLE L. DOWNS.

cense, instead of under that of the Hewitt Motor Co., this change being incidental to the chain of events which will bring the Everitt "30" cars to the Hewitt booth.

New "membership cards" also provide individual spaces for the Overland and Marion cars, as well as the Hudson. The former are products of several years' standing, and fill in very acceptably the gap below the very high priced products, which at one time threatened to mar the symmetry of the entire licensed aggregation from the marketing standpoint. The Hudson is an entirely new car, built and introduced within the year, and is intended to cater to the popular fancy both in price and style, being of the runabout and small touring car order, the latter at \$1,000 being a model that will be for the first time "unveiled" at the show.

Among the heavier and more elaborate cars exhibited will be such well-known products as the Pierce-Arrow, Stevens-Duryea, Thomas, Matheson, Locomobile and Alco. For light touring purposes and also in the realm of the runabout, there will be the Chalmers-Detroit, Apperson, Selden,

Haynes, Pope-Hartford, Corbin and E-M-F cars. As in previous years, the Studebaker products will be distributed over three different stands, one in the gasoline, one in the electric and one in the commercial vehicle departments, respectively. Knox, Franklin, and Autocar name-plates on stands in the arena and in the basement as well, also will serve to confuse the visitor who does not comprehend thoroughly the car which the management has taken in segregating vehicles intended for different classes of service. The same applies to the Columbia products, which will be shown in both the gasoline pleasure and electric vehicle sections.

Because of the entire separation of the exhibition hall on the Madison Square front of the Garden from all other departments of the show, the electric vehicle annually is given its nearest approach to an independ-

ent show of its own, by the licensed association. This year, accommodations have been arranged for nine exhibitors, instead of the eight who were included one year ago. Being a highly specialized art, electric vehicle construction does not permit of many changes which appeal to the untutored show-goer. Body equipments are subject to just enough variation to counteract for any seeming lack of variety.

Clever mechanical contrivances for controlling the motive power and neatly enclosed motors and transmissions will be found on the Waverley, the R. & L., and the Anderson vehicles. The Columbia, for the first time shown under the aegis of the Columbia Motor Car Co., though a product older than any other at the show; the Woods and the very original Bailey, are among others on view.

In the near-seclusion of the basement

oval, commercial products, ranging from the Thomas public service cab to the massive electric truck, will be arranged twelve strong. Mainly continuations of previous models, there will be at least one newcomer in the 3-ton Alco truck, which, although well-known in the market, was launched in a commercial way just too late to be seen in the Garden last year. This, with the Knox trucks and fire apparatus, the Franklin light truck and the Pope-Hartford products, the latter also displayed in commercial form for the first time; the Studebaker and General Vehicle electrics, will constitute the more varied products. The Hewitt and Sampson trucks are of original conception in many respects, while the Packard gasoline, and Baker electric vehicles, have not before been classed in this section of the show and therefore may be reckoned among the new things to be seen.

## The Exhibits and Where They Will be Located

### AUTOMOBILES.

#### Gasolene Cars.

##### Main Floor.

American Locomotive Co., New York City (13)—Alco.

Autocar Co., The, Ardmore, Pa. (7)—Autocar.

Buick Motor Co., Flint, Mich. (23)—Buick.

Cadillac Motor Car Co., Detroit, Mich. (16)—Cadillac.

Chalmers-Detroit Motor Co., Detroit, Mich. (17)—Chalmers-Detroit.

Columbia Motor Car Co., Hartford, Conn. (6)—Columbia.

Corbin Motor Vehicle Corporation, New Britain, Conn. (8)—Corbin.

Elmore Manufacturing Co., Clyde, O. (1)—Elmore.

Everitt-Metzger-Flanders Co., Detroit, Mich. (2)—E-M-F.

Franklin Mfg. Co., H. H., Syracuse, N. Y. (19)—Franklin.

Knox Automobile Co., Springfield, Mass. (5)—Knox.

Locomobile Co. of America, Bridgeport, Conn. (12)—Locomobile.

Lozier Motor Co., New York City (11)—Lozier.

Matheson Motor Car Co., Wilkes-Barre, Pa. (9)—Matheson.

Packard Motor Car Co., Detroit, Mich. (14)—Packard.

Peerless Motor Car Co., Cleveland, O. (22)—Peerless.

Pierce-Arrow Motor Car Co., Buffalo, N. Y. (15)—Pierce-Arrow.

Pope Mfg. Co., Hartford, Conn. (10)—Pope-Hartford.

Stearns Co., F. B., Cleveland, O. (4)—Stearns.

Stevens-Duryea Co., Chicopee Falls, Mass. (21)—Stevens-Duryea.

Studebaker Automobile Co., South Bend, Ind. (3)—Studebaker.

Thomas Motor Co., E. R., Buffalo, N. Y. (18)—Thomas.

Winton Motor Carriage Co., Cleveland, O. (20)—Winton.

#### Elevated Platform.

Apperson Bros. Automobile Co., Kokomo, Ind. (30)—Haynes.

Hewitt Motor Co., New York City (26)—Hewitt.

Hudson Motor Car Co., Detroit, Mich. (32)—Hudson.

Mercer Automobile Co., Trenton, N. J. (28)—Mercer.

Olds Motor Works, Lansing, Mich. (29)—Oldsmobile.

Selden Motor Vehicle Co., Rochester, N. Y. (24)—Selden.

Waltham Mfg. Co., Cleveland, O. (31)—White gasoline and steam.

Willys-Overland Co., Toledo, O. (25)—Overland.

#### Electric Cars.

##### Exhibition Hall.

Anderson Carriage Co., Detroit, Mich. (56)—Detroit.

Babcock Electric Carriage Co., Buffalo, N. Y. (53)—Babcock.

Bailey & Co., Inc., S. R., Amesbury, Mass. (51)—Bailey.

Baker Motor Vehicle Co., Cleveland, O. (55)—Baker.

Columbia Motor Car Co., Hartford, Conn. (54)—Columbia.

Rauch & Lang Carriage Co., Cleveland, O. (57)—R. & L.

Studebaker Automobile Co., South Bend, Ind. (58)—Studebaker.

Waverley Co., The, Indianapolis, Ind. (52)—Waverley.

Woods Motor Vehicle Co., Chicago, Ill. (50)—Woods.

#### Commercial Vehicles.

##### Basement.

American Locomotive Co., New York City (80)—Alco, (gasolene).

Autocar Co., The, Ardmore, Pa. (81)—Autocar, (gasolene).

Baker Motor Vehicle Co., H. H., Syracuse, N. Y. (79)—Franklin (gasolene).

General Vehicle Co., New York City (82)—General, (electric).

Hewitt Motor Co., New York City (86)—Hewitt (gasolene).

Knox Automobile Co., Springfield, Mass. (75)—Knox, (gasolene).

Packard Motor Car Co., Detroit, Mich. (83)—Packard, (gasolene).

Pope Mfg. Co., Hartford, Conn. (84)—Pope-Hartford, (gasolene).

Sampson Mfg. Co., Alden, Pittsfield, Mass. (85)—Sampson (gasolene).

Studebaker Automobile Co., South Bend, Ind. (77)—Studebaker, (electric).

Thomas Motor Co., E. R., Buffalo, N. Y. (76)—Thomas, (gasolene).

### ACCESSORIES.

#### Elevated Platform.

Ajax-Grieb Rubber Co., Trenton, N. J. (120)—Ajax tires.

American Ball Bearing Co., Cleveland, O. (155)—Ball bearings.

American Ever Ready Co., New York City (126)—Ever Ready batteries, lamps and tire specialties.

Atwater-Kent Mfg. Works, Philadelphia, Pa. (104)—Igniters and timers.

Atwood-Castle Co., Amesbury, Mass. (168)—Lamps.

Auto Improvement Co., New York City (127)—Self-starting devices and motor specialties.

Badger Brass Mfg. Co., Kenosha, Wis., and New York City (157)—Solar lamps and acetylene generators.

Baldwin Chain & Mfg. Co., Worcester, Mass. (110)—Baldwin chains and recoil check.

Bowser & Co., S. F., Ft. Wayne, Ind. (170)—Tanks, measuring pumps and gasoline storage systems.

Briscoe Mfg. Co., Detroit, Mich. (165)—Radiators and fittings.

Brown-Lipe Gear Co., Syracuse, N. Y. (152)—Transmission, differential and steering gears.

Byrne-Kingston & Co., Kokomo, Ind. (148)—Kingston carbureters, mufflers and pumps.

Coes Wrench Co., Worcester, Mass. (131)—Wrenches.

Connecticut Telephone & Electric Co., Meriden, Conn. (114)—Spark coils, switches and ignition specialties.

Consolidated Rubber Tire Co., New York City (174)—Tires.

Continental Caoutchouc Co., New York City (177)—Continental tires.

Continental Rubber Works, Erie, Pa. (136)—Continental tires.

Cook's Sons, Adam, New York City (164)—Lubricants.

Cook's Standard Tool Co., Kalamazoo, Mich. (132)—Standard jacks.

Cowles & Co., C., New Haven, Conn. (135)—Lamps, monograms and bouquet holders.

Cramp & Sons, William, Ship and Engine Building Co., Philadelphia, Pa. (109)—Bronze and bearing metal castings.

Premier Motor Mfg. Co.  
*Indianapolis, Ind.*

Pope Mfg. Co.  
*Hartford, Conn.*

Steven-Duryea Co.  
*Chicopee Falls, Mass.*

REPRESENTATIVE AMERICAN MOTOR CAR FACTORIES.

Diamond Chain and Mfg. Co., Indianapolis, Ind. (181)—Chains, sprockets, transmissions, axles.

Dietz Co., R. E., New York City (108)—Lamps.

Dixon Crucible Co., Joseph, Jersey City, N. J. (160)—Graphite and lubricants.

Duff Mfg. Co., The, Pittsburg, Pa. (139)—Barrett jacks.

Edmunds & Jones Mfg. Co., The, Detroit, Mich. (134)—Lamps.

Empire Tire Co., Trenton, N. J. (122)—Empire tires.

Firestone Tire and Rubber Co., Akron, O. (141)—Firestone pneumatic and solid tires.

Fisk Rubber Co., The, Chicopee Falls, Mass. (178)—Fisk tires, quick detachable and demountable rims.

Fox Metallic Tire Belt Co., Brooklyn, N. Y. (134 A)—Non-skid chains.

G & J Tire Co., Indianapolis, Ind. (105)—G & J tires.

Gabriel Horn Mfg. Co., Cleveland, O. (159)—Gabriel exhaust horns and shock absorbers.

Gilbert Mfg. Co., The, New Haven, Conn. (166)—Tires, jackets, lamp covers and rubber cloth specialties.

Globe Machine and Stamping Co., The, Cleveland, O. (129)—Metal stamping specialties.

Goodrich Co., B. F., The, Akron, O. (100)—Goodrich clincher tires.

Goodyear Tire and Rubber Co., The, Akron, O. (103)—Goodyear tires and compressed air inflators.

Gray & Davis, Amesbury, Mass. (106)—Lamps.

Ham Mfg. Co., C. T., Rochester, N. Y. (162)—Lamps.

Hardy Co., R. E., The, New York City (123)—Spark plugs.

Harris Oil Co., A. W., Providence, R. I. (140)—Lubricants.

Hartford Rubber Works Co., Hartford, Conn. (182)—Hartford tires.

Hartford Suspension Co., Jersey City, N. J. (121)—Truffault-Hartford shock absorbers.

Heinze Electric Co., Lowell, Mass. (161)—Magnetos, coils and ignition equipment.

Herz & Co., New York City (169)—Timers, plugs and ignition specialties.

Hoffecker Co., The, Boston, Mass. (133)—Speed indicators.

Janney-Steinmetz & Co., Philadelphia, Pa. (124)—Spark plugs, tanks and wrenches.

Jones & Co., Phineas, Newark, N. J. (111)—Rims, wood wheels.

Jones Speedometer Co., The, New York City (113)—Speedometers, annunciators, odometers, horns and specialties.

Leather Tire Goods Co., Niagara Falls, N. Y. (130)—Adjustable tire treads and non-skid bands.

Light Mfg. and Foundry Co., Pottstown, Pa. (112)—Aluminum parts and castings.

Mezger, C. A., New York City (115)—"Sootproof" spark plugs and automatic windshields.

Michelin Tire Co., Miltown, N. J. (172)—Michelin tires.

Morgan & Wright, Detroit, Mich. (180)—Morgan and Wright tires.

Mosler, A. R., New York City (158)—Spark plugs, timers and rear signal devices.

Motsinger Device Mfg. Co., Pendleton, Ind. (146)—Ignition systems.

Motz Clincher Tire and Rubber Co., The, New York City (138)—Tires.

N. Y. and N. J. Lubricant Co., New York City (117)—Lubricants.

National Carbon Co., Cleveland, O. (119)—Dry batteries.

Oliver Mfg. Co., Chicago, Ill. (142)—Peerless jacks.

Pennsylvania Rubber Co., Jeannette, Pa. (107)—Pennsylvania tires.

Pittsfield Spark Coil Co., Dalton, Mass. (150)—Ignition systems.

Randall-Faichney Co., The, Boston, Mass. (147)—Jericho exhaust horns, B-Line grease guns, Bing spark plugs.

Remy Electric Co., Anderson, Ind. (173)—Magnetos.

Republic Rubber Co., Youngstown, O. (118)—Tires.

Sager Co., J. H., Rochester, N. Y. (125)—Supplementary springs.

Spicer Universal Joint Mfg. Co., Plainfield, N. J. (149)—Universal joints.

Splitdorf, Inc., C. F., New York City (102)—Timers, distributors, coils and ignition specialties.

Springfield Metal Body Co., Springfield, Mass. (171)—Bodies and tops.

Standard Welding Co., The, Cleveland, O. (156)—Tubing, electrically welded parts and rims.

Stewart & Clark Mfg. Co., Chicago, Ill. (175)—Speed indicators.

Swinehart Clincher Tire and Rubber Co., Akron, O. (153)—Swinehart solid tires.

Timken-Detroit Axle Co., The, Detroit, Mich. (143)—Timken axles.

Timken Roller Bearing Co., Canton, O. (144)—Roller bearings.

Vacuum Oil Co., Rochester, N. Y. (167)—Lubricants.

Valentine & Co., New York City (163)—Varnishes.

Veeder Mfg. Co., Hartford, Conn. (179)—Tachometers and tachodometers.

Warner Gear Co., Muncie, Ind. (154)—Gears and parts.

Warner Instrument Co., Beloit, Wis. (145)—Warner speed indicators and clocks.

Weed Chain Tire Grip Co., New York City (116)—Non-skid tire chains.

Wheeler & Schebler, Indianapolis, Ind. (175)—Carburetors and magnetos.

Whitney Mfg. Co., The, Hartford, Conn. (151)—Whitney chains and keying systems.

Witherbee Igniter Co., Springfield, Mass. (128)—Batteries, plugs and magnetos.

#### Balcony.

Allen Auto Specialty Co., New York City (234)—Tire jackets and specialties.

Batavia Rubber Co., The, Batavia, N. Y. (207)—Tires.

Bretz Co., J. S., New York City (226)—F. & S. Imported ball bearings and U. & H. high tension magnetos.

Carpenter Steel Co., The, Reading, Pa. (231)—Parts.

Champion Ignition Co., Flint, Mich. (211)—Ignition systems.

Driggs-Seabury Ordnance Corporation, Sharon, Pa. (208)—Crank shafts and frames.

Eastern Carbon Works, Jersey City, N. J. (217)—Dry batteries.

Electric Storage Battery Co., The, Philadelphia, Pa. (200)—Accumulators.

Flentje, Ernest, Cambridge, Mass. (233)—Shock preventers.

Franklin Mfg. Co., H. H., Syracuse, N. Y. (221)—Die castings.

Frasse & Co., Peter A., New York City (224)—Tubing, forgings and nickel steels.

Geiszler Brothers' Storage Battery Co., New York City (235)—Batteries.

Havoline Oil Co., New York City (205)—Lubricants.

Haws, George A., New York City (227)—Panhard oil.

High Frequency Ignition Co., Detroit, Mich. (222)—Ignition systems.

High Wheel Auto Parts Co., Muncie, Ind. (203)—Motor buggy parts.

Hoffnung & Co., S.

Jeffrey-Dewitt Co., Newark, N. J. (215)—Reliance spark plugs.

Johnson & Co., Isaac C., Spuyten Duyvel, N. Y. (219)—Forgings and castings.

Johns-Manville Co., H. W., New York City (239)—Asbestos packing and gaskets.

K-W Ignition Co., Cleveland, O. (228)—Magnetos, spark plugs.

Keystone Lubricating Co., Philadelphia, Pa. (212)—Lubricants.

Lavalette & Co., New York City (225)—Magnetos and ignition specialties.

Link-Belt Co., Philadelphia, Pa. (202)—Reynold chains.

McGraw Tire and Rubber Co., East Palestine, O. (238)—Tires.

Miller, Charles E., New York City (209)—Brampton chains, supplies and accessories.

Miller's Sons, William P., Long Island City, N. Y. (237)—Lubricants.

Morrison-Ricker Mfg. Co., Grinnell, Ind. (229)—Gloves and gauntlets.

Mutty Co., L. J., Boston, Mass. (220)—Rubber cloth and imitation leathers.

New York Sporting Goods Co., New York City (230)—Accessories.

Noera Mfg. Co., The, Waterbury, Conn. (304)—Oilers.

Pierson Motor Supply Co., Brooklyn, N. Y. (232)—Supplies.

Perfection Wrench Co., Port Chester, N. Y. (213)—Wrenches and tools.

Prosser & Sons, Thomas, New York City (216)—Krupp steel, gears and parts.

R. I. V. Co., New York City (214)—Annular ball bearings.

Shaler, C. A., Waupun, Wis. (201)—Electric vulcanizers.

Sireno Co., The, New York City (210)—Electric horns.

Standard Leather Washer Mfg. Co., Newark, N. J. (236)—Leather washers and lugs.

Simms Magneto Co., New York City (218)—Magnetos.

Warner Mfg. Co., Toledo, O. (206)—Transmission gearing.

#### Balcony Extension, Madison Avenue.

American Vanadium Co., Pittsburg, Pa. (254)—Vanadium alloy.

Automatic Headlight Co.

Burn-Boston Battery and Mfg. Co., Boston, Mass. (251)—Sealed liquid batteries.

Cross, Frank H.

Elite Mfg. Co., Ashland, O. (244)—Jacks and pumps.

Grossman Co., Emil, New York City (240)—Red Head spark plugs, Red Rib ignition cable, and hydraulic wind shields and buffers.

Hopewell Brothers, Cambridge, Mass. (246)—Tire cases, covers, robes.

McCue Co., The, Hartford, Conn. (241)—Parts and fittings.

Motor Car Equipment Co., The, New York City (247)—Blanchard horns, Pirelli tires and supplies.

New Jersey Car Spring and Rubber Co., Jersey City, N. J. (253)—Carsprings tires.

Novelty Mfg. Co., The, New York City (248)—Metal goods.

Riley-Klotz Mfg. Co., Newark, N. J. (245)—Horns.

Stein Double Cushion Tire Co., Akron, O. (242)—Stein tires.

Tray Plate Battery Co., Binghamton, N. Y. (243)—High efficiency storage batteries.

#### Balcony Extension, Fourth Avenue.

Barnard Specialty Co.

Bosch Magneto Co., New York City (225)—Ignition systems.

Cox Brass Mfg. Co., Albany, N. Y. (263)—Clear Vision wind shields.

Detroit Motor Car Supply Co., Detroit, Mich. (270)—Bodies and tops.

Howard Demountable Rim Co., Trenton, N. J. (261)—Howard demountable rims.  
 Lavigne Mfg. Co., Detroit, Mich. (264)—Lubricators.  
 Livingston Radiator and Mfg. Co., Inc., New York City (267)—Radiators.  
 Metal Stamping Co., New York City (258)—Radiators, rails, wind shields and ball bearings.  
 Perfection Spring Co., Cleveland, O. (269)—Springs.  
 Reilly and Son, P., Philadelphia, Pa. (268)—Lap robes.  
 Stackpole Battery Co., St. Mary's, Pa. (257)—Dry batteries.  
 Stevens & Co., New York City (266)—Keno tire pump connections.  
 Traver Mfg. Co., Philip C., Far Rockaway, N. Y. (263 A)—Traver non-skid device.  
 Wayne Oil Tank and Pump Co., Ft. Wayne, Ind. (271)—Gasolene storage tanks.  
 Zeglen Bullet-Proof Cloth Co., Chicago, Ill. (260)—Non-puncturable tires and fabrics.

#### Concert Hall.

Briggs & Stratton, Milwaukee, Wis. (321)—B. & S. igniters.  
 Chase Co., L. C., Boston, Mass. (301)—Top cover leathers and plush robes.  
 Columbia Lubricants Co. of New York, New York City (303)—Lubricants.  
 Dayton Rubber Mfg. Co., The, Dayton, O. (314)—Airless tires.  
 Excelsior Motor and Mfg. Co., Chicago, Ill. (324)—Motors.  
 Federal Rubber Co., Milwaukee, Wis. (310)—Federal tires.  
 Gemmer Mfg. Co., Detroit, Mich. (325)—Steering gears and parts.  
 Hayes Mfg. Co., Detroit, Mich. (311)—Radiators, hoods and fenders.  
 Hancock Mfg. Co., Charlotte, Mich. (315)—Oilers.  
 Hall Lamp Co., Detroit, Mich. (317)—Lamps.  
 Hess-Bright Mfg. Co., The, Philadelphia, Pa. (326)—Bearings.  
 Lebanon Steel Casting Co., Lebanon, Pa. (320)—Steel castings.  
 Lovell-McConnell Mfg. Co., Newark, N. J. (322)—Klaxon horns.  
 McCord Mfg. Co., Detroit, Mich. (319)—Radiators and oilers.  
 National Coil Co., Lansing, Mich. (313)—Spark coils.  
 Pantasote Co., The, New York City (309)—Top and upholstery imitation leather.  
 Rands Mfg. Co., Detroit, Mich. (323)—Tops and wind shields.  
 Royal Equipment Co., Bridgeport, Conn. (318)—Brakes and lining.  
 Seamless Rubber Co., The, New Haven, Conn. (316)—Rubber goods, inner tubes and tubes.  
 Smith Co., A. O., Milwaukee, Wis. (304)—Gears and parts.  
 Sprague Umbrella Co., The, Norwalk, O. (300)—Tops and wind shields.  
 Standard Roller Bearing Co., Philadelphia, Pa. (306)—Ball bearings and parts.  
 Stromberg Motor Devices Co., Chicago, Ill. (307)—Carburetors.  
 Thermoid Rubber Device Co., Trenton, N. J. (305)—Tires, tubes and brake lining.  
 United States Light and Heating Co., New York City (309).  
 Vesta Accumulator Co., Chicago, Ill. (312)—Accumulators, electric lamps and spark plugs.  
 Victor Auto Supply Mfg. Co., New York City (302).

#### Second Tier.

Allers & Co., Harry A., New York City (413)—Metal polish.  
 Calmon Asbestos and Rubber Works of

America, New York City (407)—Tires and brake lining.  
 Columbia Nut and Bolt Co., Bridgeport, Conn. (414)—Lock nuts.  
 Dover Stamping and Mfg. Co., Cambridge, Mass. (405)—Drip pans, funnels and measures.  
 Grimm-Plaut Construction Co.  
 Hilton Mfg. Co., Boston, Mass. (404)—Safety starting cranks.

#### Where Ramblers are Being Exhibited.

Following a custom established two years ago, the New Rambler is exclusively shown during the New York show at the Rambler Building, Broadway and Sixty-second street, New York. The Rambler Automobile Co. of New York, has arranged for the reception of Rambler dealers, owners and friends in a way which would be impossible at any show and is providing conveniences that are in keeping with the reception.

## RECENT PATENTS.

933,367. Governor or Speed Regulator. Alberd de Dion and Georges Bouton, Puttaux, France, assignors to Etablissements de Dion-Bouton (Societe Anonyme, Pateaux, France, a Corporation of France. Filed Feb. 9, 1909. Serial No. 476,917.

1. In a governor or speed regulator, the combination of a pump case, an impeller rotatable in the case, an inlet through which fluid is sucked into the case by the impeller, an outlet through which fluid is pumped out of the case, and an adjusting disc in the case which is moved angularly through different distances by the rotating body of fluid.

933,496. Wind Shield. James H. Sprague, Norwalk, Ohio. Filed Jan. 28, 1909. Serial No. 474,649.

A wind shield, comprising a lower stationary section, a bracket extending substantially horizontally from said lower section adjacent the upper edge thereof and having a slot extending longitudinally thereof, an upper section hinged to said lower section and movable to a position substantially parallel to the lower section and upon the side thereof opposite to said bracket, a link having one end pivoted to the upper section, a bolt extending through the opposite end of said link at substantially right angles thereto and through said slot and constituting a pivotal and sliding connection between the link and bracket, and a supporting brace for the lower section independent of the bracket.

933,684. Hydrocarbon Burner. George E. Whitney, Boston, Mass., assignor, by mesne assignments, to Stanley Motor Carriage Company, a Corporation of Massachusetts. Filed Aug. 9, 1900. Serial No. 26,432.

1. In an apparatus of the class described, a main burner and its liquid fuel supply conduit heated thereby, combined with a torch also to apply heat to a portion of said conduit, a branch connecting said conduit with said torch, and means to apply heat thereto, a source of gaseous supply for said torch, and means to supply the latter from said source, said several means of sustaining the torch flame being available separately, as desired.

933,686. Block for Vehicle Springs. Thomas Wright, Jersey City, N. J. Filed April 6, 1909. Serial No. 488,288.

1. A spring block comprising spaced plates, a spacing block interposed there between, and means for holding the plates and block together.

933,748. Tire Protector. Dufferin Day, Hume, Ohio. Filed May 11, 1908. Serial No. 432,257.

In a tire protector in combination, a member of substantially U shaped form in cross section adapted to surround and completely inclose a tire and having a portion of greater internal width than said tire to permit lateral expansion of the latter within said protector, and of substantially the same or less depth than the combined depth of the tire and rim; a pair of lugs or flanges adjacent each end of said member; a nut or plate arranged in the rear of and engaging each pair of said lugs or flanges; and a right and left handed screw engaging threaded apertures in each of said nuts or plates for drawing said lugs or flanges toward each other, whereby said protector may be directly attached to said tire.

933,870. Change Speed Gearing. Austin M. Wolf, New York, N. Y. Filed Nov. 13, 1908. Serial No. 462,414.

1. A change speed gearing comprising a driven shaft, a pair of separate bevel gears in axial alignment with and rotatably independent of said driven shaft, and each provided with a clutch portion, clutch members shiftable longitudinally on said driven shaft, a counter shaft, an intermediate shaft parallel thereto, a bevel gear secured to each of the counter and intermediate shafts and adapted to mesh with the said pair of separate bevel gears, a driving shaft in axial alignment with said intermediate shaft, and power transmitting means between said counter intermediate and driving shafts, substantially for the purposes set forth.

933,960. Internal Combustion Engine. David H. Coles, Brooklyn, N. Y. Filed Oct. 16, 1908. Serial No. 458,058.

1. In an internal combustion engine, the combination of an engine cylinder having a piston therein, a crank casing forming a rear compression chamber and having a gas receiving port, two gas compression chambers each communicating with said engine cylinder and casing on opposite sides of said piston, and valve means for permitting gas to pass under pressure from said casing into said chambers alternately, to hold said gas under pressure therein during an exhaust stroke and to deliver said gas to the engine cylinder and an igniter located in the engine cylinder to explode the gas thereupon the face of the piston on a working stroke.

Town and Country Car  
15-30 H.P.

## The Stearns— “The Car Luxurious”

The Stearns is just what these words imply—a car designed and built throughout to embody the extreme of richness, elegance and convenience for urban and suburban use.

Equipped with a motor so flexible as to take smoothly the short, sharp corners and curves of city streets, yet powerful enough for any road conditions encountered in in town or country. So constructed as to permit of easily turning in narrow streets.

### The Sturdiest Car

No man knows how long a Stearns will last, for no Stearns has ever worn out.

Stearns cars have been made continually for the past 13 years, and as far as we know every Stearns ever built is in actual use today.

Stearns cars have more reserve power than any car of like rating of any make—the reserve force in a Stearns engine is what has made Stearns power famous.

### Therefore the Ultimate

Most Stearns owners have owned other makes. It has seemed natural for them to progress gradually through varying grades of quality until they reached the Stearns—the ultimate of excellence.

But once Stearns owners, they have settled down into a contented pride of ownership, for the Stearns is the ultimate car—the car to keep.

The car shown above is the famous 15-30 H.P. Stearns Limousine Town and Country Car. It can also be had in landaulet, touring car or toy tonneau body.

A more powerful car, of equal quality and luxury, will be found in the 30-60 H.P. chassis with limousine body.

Licensed under the Selden Patent

**The F. B. Stearns Company, Cleveland, Ohio**  
“The White Line Radiator Belongs to the Stearns”

934, Coupling for Power Transmission in Motor Vehicles. Howard E. Coffin, Detroit, Mich., assignor to Chalmers-Detroit Motor Company, Detroit, Mich., a Corporation of Michigan. Filed Nov. 6, 1908. Serial No. 461,418.

1. The combination with a drive shaft and a transmission shaft having their adjacent ends in normal alignment and spaced from each other, of a clutch having its movable member sleeved on the end of said drive shaft, a member detachably secured to said movable member forming an extension thereof beyond said drive shaft, and being of a length no greater than the distance between said drive shaft and transmission shaft, and a coupling sleeve for said extension member and transmission shaft telescopically engaging the former, for the purpose described.

933,960. Internal Combustion Engine. David H. Coes, Brooklyn, N. Y. Filed Dec. 3, 1908. Serial No. 465,794.

1. In an automobile, a pair of axles, a chassis, a body supported directly upon the chassis, flat metal springs arranged in separated sets at approximately opposite ends of the chassis, each spring being rigidly connected to the chassis at one end and engaging with one of the axles at the other end, all the springs being disposed at a downward and rearward angle of approximately 45 degrees relative to the axial line of the chassis.

## GARDEN SHOW SAFE FOR NEXT YEAR

**Reports Concerning Early Demolishment of Building Set at Rest—Reeves Elected General Manager of A. L. A. M.**

As stated by the Motor World would be the case, the general meeting of the Association of Licensed Automobile Manufacturers this (Thursday) morning, resulted in the election of Alfred Reeves as general manager. In addition to settling all doubts as to the incumbency of the general managership, the meeting also served to set at rest the questions revolving around whether or not there would be another Madison Square Garden show.

Reports of the sale of the Garden and projected plans for the property which would involve the destruction of the present building have been in active circulation for some time, putting an uneasiness into the tentative plans for a Garden show in 1911. Investigation and inquiry by the association resulted in an official and authoritative assurance that the Garden will not be torn down this year and that it will be ready to house the next show.

It was the sense of the meeting that the automobile show should be continued, but the difficulty of providing room in the Garden for the greatly increased list of licensed exhibitors is such that considerable thought will have to be given to the problem. The matter of finding room for the new exhibitors was turned over to the show committee and the general manager.

### Hardy to Remove to Chicago.

During the current month the R. E. Hardy Co. will remove its Sta-rite spark plug business from New York to Chicago, where it will occupy the top floor of a new \$300,000 building at 1735 Michigan avenue, corner of Eighteenth street. Mr. Hardy states that an increasing western business has convinced him that a more central location will prove of advantage. The Motor Parts Co.,

of Chicago, of which he is president, already has removed to the Michigan avenue address.

### Pioneer Motor Buggy Maker Goes Broke.

The Holsman Automobile Co., of Chicago, the pioneers in high wheel motor buggy manufacture, were petitioned into bankruptcy on Friday last, 7th inst. The American Trust & Savings Bank was appointed receiver. The failure of the company was in the nature of a surprise as until recently it was generally supposed to be doing a good business. It is stated, however, that much of the profits that had been made had been sunk in an effort to develop a freak motor. The company started from the proverbial shoestring, and made headway in the face of much ridicule. According to reports, the Harvester Trust once offered \$300,000 to Holsman if he would get out of the business, which offer, the same story adds, was refused. The petitioning creditors place the concern's assets at \$40,000 and its liabilities as exceeding \$100,000.

### Grossman in Another Wind Shield Deal.

The Emil Grossman Co., of New York City, has entered a contract with the Standard Co., of Torrington, Conn., to handle the latter's entire output of Standard wind shields. The arrangement provides, also, that the Standard Co. shall make the Hydraulic and the Springaction wind shields of the Grossman company. The Grossman factory for wind shields in Newark, N. J., has proved inadequate for the demand and eventually will be given up.

### Revere Man Now Heads Rubber Goods.

E. C. Williams, of Boston, has been elected president of the Rubber Goods Mfg. Co., succeeding J. J. Watson, who has returned to his post of treasurer of the United States Rubber Co., the parent company. The new president was the head of not only the Revere Rubber Co., which a few weeks since was acquired by the United States Rubber Co., but of the Continental Caoutchouc Co., whose tires are produced by the Revere factory.

## LICENSE WILL CEASE ITS GRINDING

**Shuts Down After Issuing Selden Franchises—Many Applications Refused and Many Suits Brewing.**

Hints and indications have not been lacking during the past two weeks that immediately following the Garden show in New York the "fur would fly" in Detroit and elsewhere in connection with automobile companies which have started business since the rendering of the Selden patent decision and which are operating without license under the patent. While the Association of Licensed Automobile Manufacturers has been busy enrolling succeeding batches of licensees from the ranks of the established manufacturers, it also has been preparing to move aggressively on the new concerns, whose action in starting up in the face of the Selden decision is regarded as a species of "contempt of court."

As a preliminary warning, official statements have been printed in the Detroit newspapers, as emanating from "the Detroit patent attorney of the association," declaring that "suits will shortly be brought against some or all of the new unlicensed manufacturers, as well as against dealers, and, if necessary, against the users of infringing automobiles."

At a meeting of the executive committee of the A. L. A. M. held at the New York headquarters yesterday (Wednesday), it was indicated that while the association purposes to be as lenient as possible with unlicensed makers who have been in the business some time and who began operations before the rendering of the Selden decision, short shrift is to be given the concerns which have sprung into being since the decision.

A great number of suits, therefore, are to be started at once, to take in the unlicensed makers who so far have escaped service.

The Licensed sessions also served to correct a growing impression that the "doors

were open" to any manufacturer who might choose to apply for a license and accept the association's terms. From a shief of applications three were accepted, these being Mo., the Atlas Motor Car Co., Springfield, the Dorris Motor Car Co., of St. Louis, Mo., and the Mack Bros. Motor Car Co., of Allentown, Pa., builders of trucks. Out of the list several other applicants were politely informed that their applications will not be considered under any circumstances, while the remainder were put aside for further consideration. The three new licensees join with the Hupp Motor Car Co., of Detroit, and the Pierce Motor Co., Racine, Wis., who late last week received licenses, in swelling the total licensed list to 57 names.

With the granting of these licenses, the door of the A. L. A. M. closed with a bang and while it has not been locked, it hereafter will require some pressure to open it. It is understood that some forty-odd applicants for licenses have been told that their applications will not receive favorable consideration.

With the recent additions, the complete list of licensees under the Selden patent, including members of the A. L. A. M., and those who have license without membership, now is as follows:

American Locomotive Co., Alco; Apperson Bros. Automobile Co., Apperson, Autocar Co., Autocar; Bartholomew Co., Glide; Atlas Motor Car Co., Springfield, Mass., Atlas; Brush Runabout Co., Brush; Buckeye Mfg. Co., Lambert; Buick Motor Co., Buick; Cadillac Motor Car Co., Cadillac; Chalmers-Detroit Motor Co., Chalmers-Detroit; Corbin Motor Vehicle Corporation, Corbin; Columbia Motor Car Co., Columbia; Dayton Motor Car Co., Stoddard-Dayton; Dorris Motor Car Co., Dorris; Elmore Mfg. Co., Elmore; Everitt-Metzger-Flanders Co., E-M-F. and Flanders; H. H. Franklin Mfg. Co., Franklin; Haynes Automobile Co., Haynes; Hewitt Motor Co., Everitt and the Hewitt truck; Hudson Motor Car Co., Hudson; Hupp Motor Car Co., Hupmobile; Jackson Automobile Co., Jackson; Knox Automobile Co., Knox.

Locomobile Company of America, Locomobile; Lozier Motor Co., Lozier; Mack Bros. Motor Car Co., Mack trucks; Matheson Motor Car Co., Matheson; Maxwell-Briscoe Motor Co., Maxwell; Mercer Automobile Co., Mercer; Mitchell Motor Car Co., Mitchell; Moline Automobile Co., Moline; Moon Motor Car Co., Moon; Mora Company, Mora; National Motor Vehicle Co., National; Nordyke & Marmon Co., Marmon; Olds Motor Works, Oldsmobile; Packard Motor Car Co., Packard; Palmer & Singer Mfg. Co., Palmer-Singer; Peerless Motor Car Co., Peerless; Pierce-Arrow Motor Car Co., Pierce-Arrow; Pierce Motor Co., Pierce-Racine; Pope Mfg. Co., Pope-Hartford; Premier Motor Mfg. Co., Premier; Regal Motor Car Co., Regal; Reo Motor Car Co., Reo; Royal Tourist Car Co., Royal Tourist.

Alden Sampson Mfg. Co., Sampson

## STUDEBAKERS LOSE THIRD SUIT

**Another Court Refuses to Enjoin E-M-F., and Criticizes Procedure—E-M-F. Wants a Pool Dissolved.**

Little was accomplished in the controversy between the E-M-F. Co., of Detroit, Mich., and its former selling agents, the Studebaker Automobile Co., of South Bend, Ind., by the action of the Studebaker Company in again instituting proceedings in Cincinnati, Ohio, for an injunction against the E-M-F. The hearing, which took place on Monday before Judge Warrington, of the United States Circuit Court, resulted in his refusing to go into the case or pass upon it. He referred the complainants back to Judge Swan, in Detroit, who two weeks ago permitted them conditionally to withdraw a similar complaint in that court.

"When this matter was first presented to me," Judge Warrington said, "I stated distinctly that I should consider myself open to investigate and pass upon the question of whether I ought to hear the cause. There are two considerations which press upon me. One is a matter of comity. Certain proprieties must be observed in the practice of the law, at the bar and in the administration of justice on the bench, and that is what I mean when I speak of the rules of comity.

"The other consideration partakes largely of the first, and that is whether I ought under any circumstances to attempt to revise the action of another judge, when I am sitting with no more power, in no different capacity from the position he occupied when he was called upon to act."

Continuing, he pointed out that a suit begun by the complainants had been brought before Judge Swan and that the exercise of a restraining power had been asked but was denied. The impropriety of a second judge of like power granting what the first refused, he declared, was obvious.

Attorney for the Studebakers called the Court's attention to the fact that in the case before Judge Swan the Studebakers made a motion for an injunction and, pending that motion, had asked for a restraining order. The latter was not granted, and before the hearing for the injunction was held the motion was withdrawn and was not determined by Judge Swan. Consequently, in the attorney's view, Judge Harrington would not be revising Judge Swan's judgment.

trucks; Selden Motor Vehicle Co., Selden; Simplex Automobile Co., Simplex; F. B. Stearns Co., Stearns; Stevens-Duryea Co., Stevens-Duryea; Studebaker Automobile Co., Studebaker-Garford; E. R. Thomas Motor Co., Thomas; Waltham Mfg. Co., White; Willys-Overland Co., Overland and Marion; Winton Motor Carriage Co., Winton; York Motor Car Co., Pullman. For

This view, however, failed to convince, and the Court ordered an entry indicating only a refusal to hear the case. The complainant's attorney then asked if such action bound up the case "to the judge who has taken no action."

"It does with me," replied the Court. "It is not for me to say that in this case he will not assume jurisdiction and exercise the power in the circumstances that have been described. Now let the case take care of itself in the course in which it was started."

As a result of the Court's attitude, the likelihood of a restraining order preventing the E-M-F. Company from selling or delivering cars to others than the Studebakers is exceedingly remote. The latter, however, yesterday filed a new motion before Judge Swan, the motion being along the same lines as their previous bills. It now is probable that the injunction will be fought to a finish before that court.

Additional legal entanglement has been introduced into the situation by the alarm of a number of the E-M-F. stockholders over a pool which it transpires was entered into last April by holders of approximately 70 per cent. of the shares. The Union Trust Co., of Detroit, was made the trustee, the agreement being that all of the shares should be voted in accordance with the wishes of the majority in the pool. Since the trouble with Studebaker has arisen, some of those in the pool do not care to have their shares tied up in such an arrangement any longer and have decided to their own satisfaction that the pool is illegal. A fear is expressed that under the pool the Studebaker interests could gain control by having a majority of the pool, so that 36 per cent. of the total company stock would serve as well as 51 per cent. without the pool. Such pressure has been brought to bear that the trust company has filed a bill in the Wayne County Circuit Court, asking a judicial opinion as to the legality of the pool, in order that the company may know where it stands.

### Profit Bonuses for Ford Forces.

Repeating the profit distribution plan that was started a year ago, the Ford Motor Co., of Detroit, Mich., has given a bonus of \$79,502 to employees, divided according to salary and years of service. Those who have been employed one year received 5 per cent. of their year's earnings; for two years, 7 per cent., while for three years service the bonus netted the factory "veterans" 10 per cent.

practical purposes it is to be remembered that the Hewitt license applies to the Metzger Motor Car Co., of Detroit, Mich., through the latter's purchase of the Hewitt Motor Co., and the Waltham Mfg. Co.'s license applies to the White Co., of Cleveland, O., which some time since acquired that franchise though the White Company's name has not yet been formally substituted.

## ACCESSORY JOBBERS IN SESSION

**Conference with Manufacturers Produces Satisfying Assurances—Initiation Fee and Annual Dues are Increased.**

Because of a meeting of the cycle jobbers held on the same day, the general meeting of the Motor Accessories Jobbers Association scheduled for yesterday (Wednesday) at the Hotel Belmont, did not develop a quorum at the first gathering, but upon the meeting being adjourned a number of late arrivals were encountered and those present reconvened. Matters relating to the future activity of the association were discussed in an informal way and a call was issued for another meeting on Thursday morning when those who had been absent by reason of attendance at the cycle jobbers conference could be on hand.

The latter meeting resulted in the raising of the initiation fee from \$25 to \$50, and the annual dues from \$20 to \$50. The committee consisting of Messrs. Loomis, Willis and Baum, which on Monday conferred with a committee of the Motor and Accessory Manufacturers, composed of Messrs. Raymond, Byrne and Wainwright, reported the results of its conference, these indicating that the accessory manufacturers are eager to co-operate with the jobbers in efforts to curb price abuses and in other trade matters affecting them both. Several accessory manufacturers were present by invitation, and they spoke on different aspects of the relationship between the jobber and the manufacturer. Assurances were given of no antagonism between the United Manufacturers and the jobbers, but considerable spice was added to the proceedings by a more or less open defiance of the jobbers by an Indianapolis concern. One new member was added to the rolls.

### Franklin Opening Two More Branches.

The Franklin Automobile Co. this week is opening a branch in St. Louis under the management of W. E. Brearley and will open one in Cincinnati about February 1st. They now are seeking a suitable location in the Ohio city.

### York Company to Take Its Car's Name.

The York Motor Car Co., York, Pa., is preparing the necessary legal formalities to change its corporate title to Pullman Motor Car Co. When the change is made the company and its product will bear the same name.

### Hudson Company Chooses Officers.

Following its separation from the Chalmers-Detroit Motor Co., under whose guidance and protection it originated, the Hudson Motor Car Co. has elected the list of officers slated at the time of the first announcement of the separation. The new

officers are as follows: J. L. Hudson, chairman of the board of directors; R. D. Chapin, president; H. E. Coffin, vice-president; F. O. Bezner, secretary, and R. B. Jackson, treasurer and general manager.

### Tincher to Manage Economy Company.

R. L. Tincher, of Chicago, who built a massive \$6,000 touring car that led to his financial undoing, has engaged with the Economy Automobile Co., of Joliet, Ill. He will become its manager and designer and as such will perfect the popular priced Economy car which during last year was made on a limited scale.

### White to Open in New Orleans.

The White Company, of Cleveland, O., shortly will open a branch in New Orleans, La. It will embrace both a show room and a garage. L. H. Wise, from the Cleveland factory, is assisting Abner Powell, the local White agent, in preparing the establishment for an early opening.

### Woodruff Made a Chalmers Director.

C. A. Woodruff has been appointed purchasing agent and a member of the board of directors of the Chalmers-Detroit Motor Co., of Detroit, Mich. He was with the National Cash Register Co. before he some time ago joined the Chalmers forces.

### Hartford's Little Strike Settled.

The so-called strike of the Hartford Rubber Works Co.'s operatives has been entirely settled. The strike, which was participated in by a very small part of the company's large force, was greatly exaggerated by some of the printed reports of it.

### Doherty Goes from East to West.

Harry W. Doherty, formerly of the Cameron Motor Car Co., has been made sales manager of the Car Makers Selling Co., 1251 Michigan avenue, Chicago, Ill. The company has the selling of the Anhut and De Tamble outputs of cars.

### Hawley Disposes of His Business.

P. E. Hawley has sold his interests and control in the Auto Equipment Co., of Detroit, Mich., which is locally prominent in the supply and accessory business. F. E. Evans is the purchaser and will assume charge at once.

### New Company Buys Puritan Plant.

The Puritan Gas Tank Co., of Canton, Mass., has been bought by a new company which has been formed for its purchase. The latter is styled the Compressed Gas Tank Co., and it will operate the present plant.

### More Tires Coming from Akron.

The Miller Rubber Co., Akron, Ohio, which heretofore has produced mechanical goods only, is preparing to begin the manufacture of tires. A large brick factory is being erected for the purpose.

## PALACE SHOW SEEN BY 104,600

**A. M. C. M. A. Gives Out Official Figures and Declares a Dividend—Annual Meeting May Prove Momentous.**

The resignation of Alfred Reeves as general manager of the American Motor Car Manufacturers Association was presented by him at the meeting of the committee on management held yesterday (Wednesday) at the association's New York headquarters. It was accepted with regrets, as the association has found in him in the past a general manager who in building up the membership, extending the association influence and conducting shows has proved a tower of strength. Reeves, as stated in last week's Motor World, will be today elected general manager of the Association of Licensed Automobile Manufacturers.

Reporting on the results of the Grand Central Palace show, Chairman R. E. Olds of the show committee, declared that in attendance, in the amount of business done and in the profits, the show exceeded any previous motor car exhibition held anywhere. The total attendance in round numbers was 104,600, exceeding the figure for last year's Palace show by several thousand. The last three days saw the heaviest attendance, Friday, the closing day, admitting more than 19,000 people. The dealers' register showed 1,284 names.

A dividend of 72 per cent. on the amounts paid by them for show space was declared to the Importers Automobile Salon and to the Motor and Accessory Manufacturers, which organizations were interested with the A. M. C. M. A. in the conduct of the show. It was officially announced that the present Grand Central Palace will not be torn down this year, and will be available for an automobile show next winter.

No little significance attaches to the fact that a letter was approved for transmission to every member of the association relative to the annual meeting which is to be held in Chicago on February 9, for action on the association's agreement, which expires by limitation on that date. It is pointed out that an important clause concerning the association's membership reads as follows:

"The term of this agreement is for five years, but any party hereto shall be considered as withdrawn from the terms thereof who fails to pay the sum or sums hereinafter mentioned within thirty days of demand therefor by the committee heretofore created." As nearly all of the more prominent members have either joined the A. L. A. M. or secured Selden licenses, the future of the A. M. C. M. A. is shrouded in considerable doubt.

On the part of the association it was voted to present Chairman Olds, of the 1910 show committee, a loving cup in appreciation of his services to the association

in the successful conduct of the show. Those attending the meeting were Chairman H. O. Smith, Premier Mfg. Co.; W. H. Van Der Voort, Moline Automobile Co.; R. E. Olds, Reo Motor Car Co.; Charles Lewis, Jackson Automobile Co.; Benjamin Briscoe, Maxwell-Briscoe Motor Car Co.; Henry Plow, Mitchell Motor Car Co.; C. C. Hanch, Nordyke & Marmon Co.; S. H. Mora, Mora Co.; and Alfred Reeves, general manager.

#### The Week's Incorporations.

Detroit, Mich.—Reynolds Motor Car Co., The, under Michigan laws, with \$40,000 capital.

Grand Rapids, Mich.—Kent Motor Car Co., under Michigan laws, with \$2,000 capital.

St. Louis, Mo.—Pope-Hartford Motor Car Co., under Missouri laws, with \$50,000 capital; to handle Pope-Hartford cars exclusively.

Indianapolis, Ind.—Ricketts Automobile Co., under Indiana laws, with \$30,000 capital. Corporators—R. Ricketts, L. F. Ricketts and E. Ricketts.

Detroit, Mich.—Standard Auto Accessory Mfg. Co., under Michigan laws, with \$4,000 capital, and Detroit Electric Vehicle Co., with \$5,000 capital.

Chicago, Ill.—Auto Vending Machine Co., under Illinois laws, with \$5,000 capital. Corporators—William W. Evans, Andreas Hummel and Rex Mackenzie.

Dallas, Tex.—Childress-Brush Motor Co., under Texas laws, with \$5,000 capital. Corporators—B. N. Childress, C. W. Childress, Ed. R. Bumpass and R. M. Hordeman.

Louisville, Ky.—Auto Parcel Delivery Co., The, under Kentucky laws, with \$8,000 capital. Corporators—A. O. Lewis, Smith Sayres, Charles New and Hubert Levy.

New Haven, Conn.—Belmont Motor Car Co., under New York laws, with \$100,000 capital. Corporators—Dr. C. B. Tiley, William J. Smith and Frank B. Frisbie, all of Hartford.

Chicago, Ill.—Chicago E-M-F. Co., under Michigan laws, with \$20,000 capital; to manufacture and deal in automobiles and accessories. Corporators—Fred A. Kerry, C. S. McDonald and William J. Zeb.

New York, N. Y.—Riverview Garage, under New York laws, with \$20,000 capital. Corporators—Joseph Convan, William A. Sanders, Hugh E. Weston, all of New York, and George Maier, Jamaica, L. I.

Middletown, N. Y.—Hotel Brown Garage Co., under New York laws, with \$10,000 capital. Corporators—Milton E. Slawson, William H. Goldsmith, Theodore A. Weller, and Bradley Post, all of Middletown.

New York City, N. Y.—Hofacker Mfg. & Supply Co., under New York laws, with \$30,000 capital; to deal in motors, engines, automobile supplies, etc. Corporators—G. Hofacker, L. Huethwohl and C. Huethwohl.

## FRENCH MAKERS' FALLING PROFITS

### Financial Reports Show Their Greatly Reduced Earning Capacities—Overproduction Worse Than Panic.

The season of 1907-8 was recognized in Europe as an especially bad one. America was undergoing financial trouble and it required but a short time for this to reflect itself in Europe. Motor car manufacturers abroad were among the first to suffer. But recent reports have been optimistic in the extreme, and it was supposed, on this side, until the latest financial reports began to make their appearance that the industry in Europe was not in just the condition most desired by the men in it. The Financial Times reports how that in the amount of net profits the seven companies showed a loss of \$291,000 for the season of 1908-9 over the season of 1907-8. In the amount carried forward the season of 1907-8 shows an excess over 1908-9 of \$67,415. The story of the dividends is also an interesting one and should tend to show that the stories of vast profits in the motor car industry are not very well founded. In 1907-8 the seven companies paid an average of 7.5 per cent. to the stockholders, but that overproduction served as even a greater blight than money stringency the dividends for 1908-9, when these same companies paid an average of only 4.28 per cent., show in a conclusive manner.

	Net Profit.		Ordinary Div.		Carried Forward.	
	1908-9	1907-8	1908-9	1907-8	1908-9	1907-8
Belsize .....	\$64,505	\$2,910*	6	nil	\$35,890	\$22,310
Charron .....	31,040†	355,505	nil	9**	100,880	210,005
Daimler .....	113,490	239,105†	nil	nil	91,665	.....
Darracq .....	491,790	801,705	7½	20	120,765	171,690
De Dion-Bouton ...	40,255	108,640‡	4	7	11,640	21,340
Delahaye & Co.....	89,725*	104,760†	6½	6½	12,125	17,945
Rossleigh .....	14,065	7,275	6	10	26,190	23,280
	\$844,870	\$1,135,870°	Av. 4.28%	Av. 7.5%	\$399,155	\$466,570

\* Loss on 18 months business. † Before deducting depreciation. \*\* On preferred ordinary. ‡ Loss. \$35,405 withdrawn from general reserve account to cover debit balance. § For 18 months. ° To December 31st, 1908. h To December 31st, 1907. ° Total after deducting loss of \$242,015 by two companies.

The fact that some companies have been able to conduct their business with profit is commented on by The Financial Times as follows:

"As usual, the experiences of the different companies have been varied, for in the motor trade so much depends upon the temporary popularity of one particular type of car that even in the worst seasons a concern which happens to produce something which hits the public fancy may be able to give a good account of itself." Explaining the situation in another line, it says:

"Another factor, and one which has to be taken into account in estimating the future possibilities of the trade, is the slackening off in the demand for public utility and trade vehicles, such as motor 'busses, motor cabs and motor wagons and lorries. Although the horse is steadily being superseded by

the motor, the pace at which the alteration is being carried out is not quite so fast now as it was, and after the first demands were satisfied there came the inevitable reduction in the number of fresh orders, while profits had been reduced owing to the greatly increased competition. It is not surprising, therefore, that the majority of the companies with which we are able to deal today exhibit declines in their net earnings even against the poor figures of 1907-8 and perhaps the most surprising thing is that three of the seven have managed to improve their condition."

American manufacturers have been free in past years to admit their indebtedness to Europe for its share in the development of the motor car. Matters of design, however, are not the only ones from which they might draw lessons. In Europe the shares of a number of companies are listed on exchanges and by reason of that fact their annual reports are made public. Reports from several companies whose stock is listed show in a clear cut and most conclusive way what over production has done across the Atlantic.

By way of explanation it should be said that the Pierce-Arrow Motor Car Company, of Buffalo, has as one of its business principles the keeping in close touch at all times with all its dealers. This includes sending them information of various kinds bearing on its cars, the status of the industry and other matters that would be to their interest to know. In line with this policy it has just sent to its dealers a resume of the

financial reports of seven European companies as given in The Financial Times of London.

#### Mitchell to Exhibit at Brussels Show.

La Touraine carried as part of her cargo when she last sailed from New York, the express consignment of the Mitchell Motor Car Company, of Racine, Wis., for the automobile show at Brussels. The Wisconsin company will there exhibit one polished chassis, a five passenger car fully equipped, and one seven passenger machine and a roadster.

#### Robertson Hangs Out His Shingle.

George Robertson, the race driver, has entered the selling side of the business. He has taken the New York agency for the Parry, made in Indianapolis.

## IN THE RETAIL WORLD.

William Watkins has opened a garage in Medford, Okla.

Boyd & Vangilden are preparing to open a garage in Beatrice, Neb.

E. A. Perkins, Waterbury, Conn., is building a new garage. It is located in Prospect street.

C. W. Pearson, Vineland, N. J., is having built a garage. It will be situated on Landis avenue, near Eighth street.

The Selden Motor Car Sales Co. has been formed in Kansas City, Mo., to handle the Selden car; it has located at 913 East Fifteenth street.

The Memphis (Tenn.) Automobile Co., is to have a new home erected at the corner of Fourth and Monroe avenues. Its dimensions will be 150x75 feet.

The Boise Automobile Co., of Boise, Idaho, has had plans drawn for a new garage. It will be erected at the corner of Eleventh and Grove streets.

C. P. Grimes, Nenacook, N. H., has let the contract for the construction of a new garage on South Main street. The building will be of wood, two stories high.

The Craig Auto Co., of Detroit, Mich., which has the agency for the new Abbott car, has opened a salesroom. The location is Jefferson avenue and Beaubier street.

Keck, Gonnerman & Co., Evansville, Ind., have taken possession of their new garage on Pearl street. It is a two story building, 30x80 feet, with a power plant on the second floor.

C. W. Cain, Columbus, O., has leased quarters in the new building at Fourth and Spring streets, where he will open an up-to-date garage. He will represent the American car.

The W. & R. Motor Truck Co., Taunton, Mass., has leased the garage which is being erected on Washington street by the Old Colony Investment Trust. The structure is 40x100 feet.

The F. A. Ballou Co., Buffalo, N. Y., one of the old established motor boat and marine engine dealers in the Bison City, have "taken on" automobiles. They are representing the Selden car.

The Irvin Automobile Co., Jefferson, Pa., has taken possession of its fine new garage situated in the rear of the First National Bank building. The establishment is the most pretentious in the town.

The Collings Carriage Co., which for 83 years has been engaged in the vehicle business in Philadelphia, has entered the automobile trade. It will handle the Rainier car at 1719 Chestnut street.

The Seattle, Wash., automobile colony has received still another acquisition. The new concern will handle the Overland, Marion, Thomas Flyer and Waverley electric. H. C. Fenn will be general manager.

The Binghamton (N. Y.) Motor Car Co., has let the contract for the construction of

a new garage at 195-199 State street, opposite its present location. The structure will be built of pressed brick and will cost \$20,000.

Dayton View, which is a suburb of Dayton, O., now possesses a garage of which Florence Lamp is the proprietor. It is situated on Grafton avenue, between Neal and Summers streets, and a frame one story structure.

The Electric Garage Co., Minneapolis, Minn., have had plans drawn for the erection of a garage on Hennepin avenue at Fifteenth street. It will be a brick structure, 125x37 feet, two stories and basement and will cost \$12,000.

George H. Jewett, a carriage manufacturer of Worcester, Mass., is having built a garage and carriage factory combined, in Shrewsbury boulevard. The building will be of fireproof construction, 115x55 feet, three stories, and will cost \$30,000.

Ditmars, Kerr & Co., West Liberty, Ia., a large mercantile firm of that place, are going after the automobile business of the town in earnest and are erecting a large garage. It will be constructed of veneered brick, with dimensions 40x64 feet.

Savage & Son, Rockford, Ill., who operates a large general machine shop are building a garage adjacent to their plant, which will be opened in the spring by Fred Savage as a garage. It will be equipped with modern and complete facilities for repair work.

Des Moines, Iowa, has a new automobile firm in the Herring Motor Car Co., which has "opened up" at 912-14 Locust street. C. L. Herring and B. W. Scott comprise the firm, which will act as Iowa distributors of the Ford. Both of them are old automobile men.

William F. Wagner, Massillon, O., whose garage was destroyed by fire in October last, will rebuild. His new establishment will be 50x108, built of pressed brick and will be located at the corner of North Erie and North streets. It will be ready for occupancy in the spring.

Moser & Lampe, Altoona, Pa., who are making ready to embark in the automobile business in that town, have let the contract for the construction of a garage at 1722-24 Eleventh avenue. The building will cost \$3,500, and is expected to be ready for occupancy by February 1.

Smith & Hubbell, Springfield, Mass., have completed the work of transforming the former Swedish church on Union street into a garage, and are installed in the remodeled structure. The building now consists of two stories and basement with a fully-equipped repair shop.

L. C. Smith, of Armstrong & Smith, Cheyenne, Wyo., has purchased the holdings of T. C. Armstrong, who retires from the firm, and admitted H. Blacock to partnership. The enterprise, which is located at 1708 Central avenue, will continue to be oper-

ated as the Cheyenne Auto and Supply Co.

W. E. Stalnaker has become president and general manager of the Premier Motor Car Co. of Illinois, with headquarters at 2329-31 Michigan avenue, Chicago, succeeding Webb Jay, who severs all connection with the company. The latter, however, will continue to serve the Premier in the capacity of factory traveling representative.

The new building in Chicago of Tennant Motor, Ltd., at the southwest corner of Michigan avenue and Twenty-fifth street, is expected to be completed by March 1. It will be in the French renaissance style of architecture, four stories high and built of gray terra cotta relieved with green. The estimated cost is \$200,000.

The Northwestern Stearns Co., incorporated to handle the Stearns cars in the northwest, has taken salesrooms at 1202 Hennepin avenue, Minneapolis, Minn. The company will have a branch office in Duluth and its agents will cover Minnesota, Wisconsin, Montana and North and South Dakota. A. G. Fitzgerald is manager of the company.

Seattle, Wash., has another new automobile concern which styles itself the F. A. Bardshar Automobile Co. They will handle the Stevens-Duryea in Western Washington and soon will let the contract for the building of a large garage. The senior member of the firm, F. A. Bardshar, formerly handled the Stevens-Duryea in California, while his partner, Thomas G. Young, comes from the Olympic Car Co., a local establishment.

Theodore Winningham, Kansas City, Mo., has filed suit in the Superior court against John T. Neil, superintendent of buildings to compel the latter to issue a permit for the erection of a garage on South Main street. Winningham claims that he has complied with all the provisions of the ordinances recently passed governing the erection of garages, and that though the building inspector granted him a permit, Superintendent Neil is holding it up.

New Bedford, Mass., will have better garage facilities when several establishments which are in process of construction are completed. Thomas S. Hathaway has moved an old building to a new location on the south side of Hawthorn street and is transforming it into a garage. Wayland L. Sturtevant is having built a garage of cement blocks on Hickory street, and Charles R. Hunt also is awaiting the completion of a new garage on Elm street.

Having secured the state agency for the Everitt, the Security Automobile Co., Detroit, Mich., has closed a deal for the erection of a mammoth garage on Woodward avenue near Warren street. Pending the completion of the structure, which will be 60x250, and is expected to be ready by February 15, the concern will have temporary quarters at 872 Woodward avenue. John A. Sibley and W. J. Sasterton, who constitute the firm, are well known in the trade.

# **SIMPLICITY—ACCESSIBILITY—ECONOMY**

are among the distinguishing features of the

# **White Gasoline Car**

The design of the White Gasoline Car is at least one year in advance of any other American machine. The White possesses all the desirable qualities to be found in other high grade cars and, in addition, it has certain advantageous features which are not yet embodied in the others. Among these features are simplicity, accessibility and economy.

- 1.—**SIMPLICITY.** There are fewer parts to the White than to any other car. Nothing essential has been omitted; well thought-out design has eliminated superfluous parts.
- 2.—**ACCESSIBILITY.** Any part can be reached without removing or disturbing any other part.
- 3.—**ECONOMY.** Low fuel consumption secured by the use of the "long stroke" engine, four-speed transmission and other refinements. Low cost of up-keep obtained because of simplicity and accessibility, and because the materials are the best ever put into a car of moderate price.

The White town cars are a revelation of luxury and refinement, combined with moderate cost.

### Courts, Not Law, at Fault.

It scarcely required the recommendation contained in the Governor's message to the legislature, to promote tinkering with the New York automobile law. That has become a legislative pastime that recurs each year, and though heretofore it has served merely to waste time and breath, that this year's effort to turn the law inside out and evolve a new one will be more serious than ever, there is no doubt. The desire to extract more money from the motorist's purse is strong, as is the notion that suspending or revoking a citizen's right to use the common highway is a cure for all evils.

Despite the fact that double taxation in whatever guise is wrongful in letter and in spirit, and that converting an inalienable right into a revokable privilege is opposed to the principle of equal and exact justice and also in spite of the fact that experience in other states has demonstrated that as cure-alls these alleged remedies are of small effect, it will cause no surprise if the pres-

sure brought to bear does not result in enacting such provisions into the laws of New York. Hysterical newspapers, professional crusaders and reformers, and some shallow-thinking motorists, and some others who like to see their names in print, both have lifted their voices in praise or in demand of such exactions. It therefore will require but a tragic happening carrying big headlines properly to impress the legislature at the psychological moment.

Leavening the mass of flubdub that the subject has created, the views expressed by Mr. H. H. Franklin, the Syracuse automobile manufacturer, stand out like a searchlight of truth. In effect, Mr. Franklin maintains that the only thing the matter with the present law is the lack of enforcement, which is an opinion that reaches to the very heart of the situation.

"Is the law too lenient as regards penalties for violating speed provisions?" he asks in discussing it, and answers: "Clearly not. If it were too lenient we would expect to find justices of the peace and courts of special sessions giving convicted violators of the motor vehicle law the full penalties prescribed. On the other hand, it is doubtful if a case can be found in the State of New York where the punishment of the convicted offender has been as severe as the law would allow. If the speed provisions and the penalties for their violations are as severe as they should be, clearly there is nothing further that the public needs for its protection except the enforcement of the law. Enforcing the law will stop speeding and stop accidents more than all the amendments to the existing law and more than any new law that the next legislature can enact."

Every thinking man who is not subject to hysteria or to the spell of expediency must know that Mr. Franklin is right. The present New York law is as fair a one as ever will be obtained until motorists, as such, actively "go into politics;" its preservation and its enforcement are worth fighting for. Its penalties are ample to meet all needs. For no other law that ever may be enacted will serve better purposes, as there is no reason to believe that it will meet with better enforcement.

While lack of enforcement usually suggests laxity, or worse, on the part of the police, and undoubtedly such laxity enters into present conditions, Mr. Franklin might have added to the service he rendered had he pointed out the manner in which the courts themselves are responsible for such states of affairs as make the law appear in-

adequate and give rise to periodical outbursts of public hysteria. For the ultimate blame does rest on the courts. They are too greatly susceptible to that personal influence which is brought to bear whenever the law is offended, and which is the undoing of so very many wise measures. Tempering justice with mercy is a fine quality, but the suspended sentence and the farcical imprisonment of chronic offenders, who are able to bring influence to their aid, constitute the seat of all the trouble.

If Governor Hughes or any reformer or crusader sincerely desires to better conditions, he should examine the court records. He will find "influence" written all over them and will discover, also, what Mr. Franklin remarked, i. e., that no effort, or small effort, has been made to administer those corrective penalties for which the existing law provides. The courts, not the legislature, is the source from which real relief must come; the batteries should be turned in that direction.

### Development of the Catalog.

Not the least of many remarkable developments in the automobile industry is the development of catalogs devoted to the better class of cars. To style them "editions de luxe" is but mildly to convey an idea of their appearance and their quality. Not a few of them are positively regal in their richness of their design, texture and coloring. For industrial purposes it does not seem possible that the arts of the painter, the engraver, the printer and the paper maker can attain to much greater heights; those arts appear well nigh exhausted. While the person who has seen one, or two, or three of these catalogs may be able to form conception of the others, it is only when a collection of a dozen or more are viewed that the real extent and lavishness of the effort properly is appreciated. Few libraries hold more superb creations or more exquisite variety. The catalogs of themselves represent a princely fortune.

### About the Reputation of Cars.

Fostering the social career of their cars with all the vigilance and foresight of a Newport mother with a handsome daughter, there are several makers who intend that their products shall not become the property of the unwashed, and who are perfectly willing to leave it to others to supply cars for the masses, in the figurative sense, while they themselves diplomatically devote strict attention to the classes. To the un-

initiated a revelation of what rigid policies and farseeing psychology govern the sales methods of some of the most prominent manufacturers, in relation to discriminating as to the retail customers their dealers may take, is calculated to throw an entirely new light on a phase of the automobile business which in many respects is remarkable.

That there are distinctly fashionable prejudices for certain makes of car as against others of the same price and capacity is more or less generally recognized, but these prejudices or favoritisms are felt most keenly by the competing dealers and manufacturers who find it impossible to oppose them. In the same connection, there is a negative phenomenon which is hardly observable until one's attention is called to it. It lies in the fact that certain well known cars rarely are found in the control or possession of stage people, liquor dealers or conspicuous "high fliers," and also they are not the cars bought by persons of unpleasant or doubtful reputation, although these same persons may have both the inclination and money for the purchase of the particular cars in question. Similarly these cars are not pictured in newspapers and magazines with "Dotty Dimples" and her gay companions at the wheel or in the tonneau.

Patching all the individual evidences together, it still is difficult to grasp the thoroughness and cool calculation that underlies the building of a social reputation for a car, unless the general scheme be known. Each individual machine is chaperoned with the utmost strictness until a purchaser of suitable social position is found for it, the dealers and branches being controlled rigidly by the factory, whose instructions in this regard they dare not violate. The "high society" and fashionable atmosphere is created and stimulated by all the arts that can be summoned for the purpose. Magnificent salesrooms with decorative effects that are rich, but repressed from gaudiness; salesmen whose masculine pulchritude and aristocratic connections make them cotillion leaders as well; pictures representing the car in scenes heavy with the life, avocations and pastimes of the elect—these and many other "properties" are used with a view to establishing the car as an accessory to fashionable social existence, and to placing it in the accepted list.

Very little blatant "reason why" campaigning on the mechanical side is done. This is not at all due to any reason for silence on that score that exists in the

## COMING EVENTS

January 8-15, New York City—Association of Licensed Automobile Manufacturers' tenth annual show in Madison Square Garden.

January 13, New York City—Second show meeting of the Society of Automobile Engineers at the Engineering Society's building, 25 West Thirty-ninth street. Dinner in the evening.

January 15-29, Philadelphia, Pa.—Automobile Trade Association's ninth annual show in Second Regiment armory.

January 17-22, Kansas City, Mo.—Motor Car Trade Association's show in Convention Hall.

January 24-29, Portland, Ore.—Portland Automobile Club and Dealers Association's show in Armory.

January 24-30, Washington, D. C.—Washington Automobile Dealers Association's fourth annual show in Convention Hall.

January 28-February 5, Edinburgh, Scotland—Scottish Motor Trade Association's annual show in Waverly Market.

January 29-February 5, Grand Forks, N. D.—Northwestern Implement Dealers' first annual automobile show.

February 4-6, New Orleans, La.—New Orleans Automobile Club's annual Mardi Gras speed carnival.

February 5-12, Chicago, Ill.—National Association of Automobile Manufacturers' ninth annual show in Coliseum.

February 14-19, Buffalo, N. Y.—Automobile Club of Buffalo's eighth annual show in Convention Hall.

February 14-19, Hartford, Conn.—Hartford Automobile Dealers Association's third annual show in Foot Guard Armory.

February 14-19, St. Louis, Mo.—St. Louis Automobile Dealers Association's annual show in First Regiment Armory.

February 19-26, Minneapolis, Minn.—Minneapolis Automobile Show Association's exhibition in National Guard Armory.

February 19-26, Newark, N. J.—Associated Automobile Clubs of New Jersey's show in Essex Armory.

February 19-26, Salt Lake City, Utah—Automobile show in Auditorium.

February 21-26, Binghamton, N. Y.—Automobile show in State Armory.

February 21-26, Cincinnati, O.—Automobile Club of Cincinnati's annual show in Music Hall.

February 21-27, Cleveland, O.—Cleveland Automobile Dealers Association's annual show in Central Armory.

February 22-27, Milwaukee, Wis.—Milwaukee Automobile Club's second annual show in Auditorium.

February 24-March 3, Toronto, Can.—Ontario Motor League's show in St. Lawrence Arena.

February 28-March 4, Omaha, Neb.—Omaha and Council Bluffs Automobile Dealers' show.

February 28-March 5, Kansas City, Mo.—Kansas City Automobile Dealers Association's fourth annual show in Convention Hall.

March 5-12, Boston, Mass.—Boston Automobile Dealers Association's eighth annual show in Mechanics Building.

March 12-19, Syracuse, N. Y.—Syracuse Automobile Dealers Association's annual show in State Armory.

March 21-28, Denver, Col.—Denver Motor Club's annual show, in Convention Hall.

March 26-April 2, Montreal, Can.—Fourth National Automobile and Sportsmen's show.

mechanism, because the latter in each instance represents the manufacturer's best efforts for perfection. The "reason why," however, is apt to be a bit of a bore to the people who are being sought as customers, and perhaps would require for its digestion rather more mental effort than they are prepared to give it. It is not presented, therefore, until it is demanded. Anyway, the cars are purchased on reputation, and if they were mechanically faulty they would have no reputation socially.

So secure have some cars become in fashionable and social approval that a species of what almost amounts to snobbery and offensive "climbing" has grown up in connection with certain classes of customers, these being the sort who select this or that make with confessed disregard of whether it is better or worse mechanically than another, but because it is the kind that is

socially approved. When a car has such customers, it has "arrived."

It is evident that the design, construction and mechanism, the features of body, finish and equipment, and the matter of price do not alone or in combination wholly decide the saleability of cars to certain classes of trade. Disappointed manufacturers who cannot understand why they are ignored in favor of others where this trade is concerned must recognize that their more successful rivals have an intangible but effective advantage which has been created by foresight and unrelenting policy. The magic of reputation in this application also has a lesson for makers of "popular" cars, in suggesting that they take into account not only the obvious elements of their field of sale but consider also some of the more obscure forces which may exist, relating to public approval and esteem.

## Garden Show Superb from All Standpoints

INGENIOUS AND ARTISTIC

ARRANGEMENT OF THE PRIVATE BOXES

Of all the public exhibitions ever held in Madison Square Garden, and perhaps in any other building in New York or any other city, it is fairly safe to say that in impressive splendor none is comparable with the automobile show of the Association of Licensed Automobile Manufacturers, which has occupied that structure since Saturday evening last, 8th inst., and which will occupy it until Saturday night next. By comparison, all former decorative efforts appears to have been either much overdone or underdone; they were either too fantastic or too austere. It is a far cry to the Swiss villas and Italian gardens of other years, with their great expanses of theatrical canvas paintings and their white staff statuary; they now appear almost Coney Islandish, while the severely formal "dressing" of last season now seems so chilling that the wonder is that it ever appeared in any other light.

Technically, the decorative scheme of the

present show is that of a Roman amphitheatre, and so great and so striking is its effectiveness that few minds will disagree that, with certain obvious modifications, Madison Square Garden would be the better were the plan a permanent part of the architectural design. Neither words nor photographs can do the display full justice.

White is the dominant color in the decorative scheme; it is relieved by red and green of not too obtrusive shades and just enough of them not to mar the clean, wholesome picture. The girdered ceiling of the big building is wholly hidden by a deep blue fabric that simulates the sky when the myriads of electric lights are turned on at night.

The pure white balustrade extends all the way around the elevated platform, and huge Doric columns extend up from the aisle on the elevated platform to the top of the building, with their ends at the edge of the deep blue fabric that conceals the

ceiling. The show emblems, great artillery wheels with red spokes and surmounted by golden eagles, are used to top off the thirty columns that are placed at regular intervals around the arena. The upper balcony has a railing of Greek lattice work, painted white, and both platform and balconies are edged with electric bulbs.

The signs of the names of the cars exhibited on the main floor and elevated platform are of red letters, painted on white glass backgrounds, the glass being the windows of big lamps at the tops of tall green lampposts of ornamental design. The signs for the exhibits on the elevated platform are suspended overhead.

If the general effectiveness of the design is impressive, less cannot be said of the splendid and surprising manner in which seating accommodations have been provided for spectators who desire them. At previous shows the private boxes which surround the arena have been built over for

GENERAL VIEW OF THE MADISON SQUARE GARDEN SHOW

exhibition purposes, but this year they serve the object for which they were designed, and without sacrifice of space. The boxes are located behind the exhibits on the main floor, of which they command a good view, and are set beneath the overhang of the elevated platform. Each box is made to appear separate by a framing and drapery of rich red plush, and the effect adds immensely to the general scheme, the framing of the box seats lending to them and their occupants an appearance of elegance and exclusiveness that is not to be gainsaid. The contrasting effect is such that these same boxes as they appear at the Horse Show, when they are occupied by perfumed and bejeweled society folk, make that function and those occupying the seats seem plebeian indeed. The transformation of the boxes was but one of the several happy ideas of the designer and decorator, W. W. Knowles, and of the A. L. A. M. show committee, Col. George Pope, Charles Clifton and M. L. Downs, and if ever the automobile show becomes a semi-social function such as the Horse Show, where the upper crust goes to seat itself in order to see and be seen, the present arrangement of the boxes should play a largely contributing part in achieving that result.

The red framing of the box seats is the touch of color that relieves the surrounding white on the main floor, but the red background of the signs over the accessory exhibits on the galleries overhead are sufficient to further relieve what otherwise might be monotonous whiteness. The green in the color scheme is supplied by the carpeting and lampposts. White and red are the colors carried into all parts of the building—the galleries, the concert hall and the basement. The walls are hidden by panelings of tan above green and surmounted by white signs with red lettering.

The show was inaugurated on Saturday evening without other ceremony than the opening of the doors; and since they were opened the crowds have flocked in in increasing numbers, save on Tuesday, one of the two days on which the admission fee was doubled. The building has been thronged at all hours; during the afternoon and evenings it has been literally packed—that is, the main floor—and progress has been possible only by moving with the tide of humanity. At night, it is doubtful if more than half of the visitors have obtained more than a cursory glimpse of the cars, as the other half has congested the exhibit spaces, particularly those on which anything having "action" or anything unusual is displayed. During the morning hours the trade attendance has been large and much business has been transacted, most of it being in the nature of sales by visiting agents to visitors from their respective towns, for very many of the manufacturers long since disposed of their product to their agents. Generally speaking, the accessory exhibitors also appear to be doing well, but, as always, it is the cars that the

crowd comes to see and only a comparatively small portion of it climbs upstairs or goes down to see the small wares, or even the notable display of trophies which, arranged in glass cabinets, is located in the

basement. But there are more "show cars" and more show features than ever before for the spectators to see. One rather hypercritical tradesman described the show as an exhibition of the body building art, which,

if not exactly right, is not altogether wrong. There is so much variety and color in bodies that, to employ the vernacular, it may be said the rainbow has nothing on the Garden show. The so-called torpedo, or gunboat, bodies are, of course, the striking novelties, and they are finished in colors that make them even more striking, the radical P-S and Winton in white and the Franklin in "battleship grey."

Of striking finishes—striking either because they "scream" or because of unusual or pleasing hues, there are a number. A Knox red torpedo and a red Apperson are two of the "screamers;" a Haynes painted in violet appears unusual; a Pope-Hartford in chocolate with upholstery to match is off the usual, but not offensively so; an Alco in French grey, with broad black and white striping, "looks sassy," while a Columbia torpedo of the rational type finished in dark cream, with gold and white striping, catches the eye because of its unobtrusive modesty and yet lack of monotony.

The polished show chassis is not nearly so numerous in evidence as in former years. The painted chassis is taking its place. The Stearns, Thomas and Royal display chassis are finished in white, the P-S, E-M-F. and White in grey and the Haynes in black. Of all efforts made to display chassis to educational advantage none has been more novel or ingenious than that of the E. R. Thomas Motor Co.; theirs is a tumbling chassis; it is suspended by rods at either end, which are supported by pedestals in which are concealed electric motors which cause the whole chassis to rotate sidewise; as it rotates, electric lights successively flash in opaque glass boxes arranged at feature points and reveal the explanation of the several features, which is lettered on the glass. The Chalmers-Detroit and the Hudson companies employ electric motors to operate cutaway engines which illustrate the action of pistons and valves; Chalmers-Detroit also demonstrates the ease of running of its crank shaft bearings by means of an electric fan, the wind from which is sufficient to cause the shaft to rotate.

One other unusual exhibit is located in the press room and near the doorway, where passers-by may see. It is a very large photograph of a man wearing a cap and an overcoat, which bears the caption, "The wizard of the motor world." The "wizard's" name is said to be Durant, who is guiding a small portion of the automobile industry into the realm of high finance, assisted by a dollar sign, a figure 6 and seven naughts. These figures apparently so greatly impressed a photographer that he is trying to sell the "wizard's" pictures for souvenirs. At one time he had the sample photograph labeled "Napoleon of the Automobile Industry," but some one apparently told him what happened to the original Napoleon and he changed the sign. "Wizard" is safer and more variegated.

VIEW SHOWING ARRANGEMENT OF EXHIBITS ON THE ELEVATED PLATFORM

## The Remarkable and Striking Display of Bodies

Unquestionably the most pretentious and utilitarian of the strictly "show cars" is the Pierce limousine-landaulet, which combines in harmonious fashion practically all the essentials of touring car, limousine, landaulet, pullman car and lady's boudoir. Externally it is as striking in appearance as all show cars should be: done in brilliant coach yellow with fine stripings, glossy black top and folding hood over the driver's seat. To add tone to the exterior, the lamp equipment, which is of special design, is of black finish, while further distinction is lent to its general appearance by the special swinging wind shield which is set back close to the steering wheel. The back carries a couple of sizeable trunks, while room for more personal impedimenta is provided on the roof. The interior is most elaborately equipped, the accessories of comfort including even a folding lavatory, much the

same in style as is used on small cruising yachts.

Upon the adjoining stand, and conspicuously presented at the very entrance to the big arena, no less than four Packard show cars are on view, which, in the aggregate outrival any other exhibit in point of gorgeousness and lavishness of composition. This is the first of many shows in which no Packard chassis is on view. Its place at former exhibits is occupied by a delicate confection in pale tints, almost too delicate to mention by name lest they fade, and which is embellished with gold plated lamp trimmings, handles and fittings, neatly tied up with silken cords. One of its neighbors is a landaulet, finished in golden bronze, very gaudy when seen at a distance, and very rich when viewed at close range; while a third is an elaborate berlin or double limousine, which is a beautiful example

of the carriage maker's art, unblushingly giddy as to coloring. The final jewel in the setting is an old "delft" creation, in limousine form, with vertical stripes covering the hood side and rear panels, in which blue and white alternate, the white bands being ornamented with the stately fleur de lis. The interior is upholstered in deep, rich blue and in white brocade, while the soberer tone, but in lighter shades, is carried out in the trimming of the upper bodywork. The lamps and other accessory equipment are enamelled in blue to match the general tone of the car.

Another striking and unusual, though less conspicuous car is the brougham fitted to the Thomas town car chassis. With its special lamp equipment, glazed extension front and clean lines, it is one of the most attractive of the new style vehicles in the show. More utilitarian in its nature, but

still of a catchy type, is the Marion town car, which is of the landaulet order, with hooded front seat.

Limousines, of the more conventional order, but exhibiting original peculiarities in respect to excellence of equipment or delicacy of taste in choosing the decorative scheme, are shown on the Stevens-Duryea, Locomobile, Alco, Studebaker and Knox stands. Deserving of special mention in this connection is the Columbia limousine, which in clean finish and modest elegance of interior, reflects the long experience of its builders in the production of bodies for motor vehicle work.

But to return to the show features of the exhibition, perhaps the most radical and striking element is the array of torpedo bodies and semi, demi and semidemi approximations to that novel class. Basically, the torpedo type, whether exhibited under that or any other name, is a dust and weather-proof form of vehicle, which just now is making a vast impression on such of the American manufacturers as are ready to acknowledge themselves as of open mind. How craftily this new possibility of introducing novelty has been turned to account in the production of show models is evidenced on at least a half dozen stands, and in most conspicuous fashion.

Apparently distended with pride at its ultra unconventionality, the Winton, white and spotless in its newness, stands forth as probably the most striking presentation of this type. To say that this particular model is all puffed up, expresses but mildly the

aisle, nor on the stand. But those who are disposed to view it seriously, as a possible forerunner of a distinguished class of vehicles, are able to discern in its lines of low air resistance, ample comfort and protection for the driver and his sole companion, and an almost unlimited amount of luggage space, wherein plenty of supplies and per-

nautical parlance—falls away to a lower level which is uniform until a rise similar to that of the front, is produced by the elevation in the rear, while the middle section is of uniform height. A sturdy victoria top hoods in the rear seat, adding considerably to the novel appearance of the vehicle as a whole. Access to the

PIERCE-ARROW LIMOUSINE-LANDAULET

sonal baggage may be stowed in a secure and convenient manner.

Palmer & Singer, in an elevated platform space, also display both ingenuity and what may be termed "broad minded freedom from the conventional" in the design of a four-passenger torpedo which possesses many

cosey interior is gained through either of two side doors, one admitting to the front section from the left, while the rear section may be entered from the right. Another point of novelty as well must be conceded the interior, since the seat next that of the driver is swivelled, like an arm-chair, and may be made to face either forward or back. The rear of the tonneau is convexed liberally, thus providing luggage space under the rear seat, while a rack for extra tires is provided externally on the extreme rear.

In the adjoining booth, the Royal Tourist appears in somewhat mild torpedo form, with relatively low sides and a close-coupled effect which leaves a bit of flat platform exposed over the rear of the chassis. Its outstanding peculiarity is that the rear portions of both front and back seats are much alike, and that the "fat" section of the forward member is, due to the fact that a large tank is concealed within its midst. Properly carrying out the warlike suggestion of its name, this model is finished in a sort of battleship grey.

With its large tires and rather high set spring equipment, the floor of the Franklin torpedo is raised considerably above the ground, quite in contrast to other vehicles of its type. Also an original characteristic, the seat backs and stright sides are not excessively high, while further distinction is added by the shape of the sloping bonnet, which has been drawn somewhat after the Renault pattern, or perhaps more in the manner of the Darracq lines of ancient automobile history. Mounted on an adjustable stand directly in front of the steering wheel is a round wind shield, not over 8 or 9 inches in diameter, its tripod support be-

PALMER-SINGER WITH "DREADNOUGHT" BODY

first impression which its appearance creates. It is literally bloated. The swelling begins just back of the hooded dash, where the sides are carried well up above the level of the seat, and extends to the important-looking rear portion, which in bulging convexity extends clear to the back of the long chassis. Suggestions as to its proper designation and the probable prototype from which its ample shape was derived are not lacking in the adjoining

points novel even to this apparently simple field of body construction. To begin with, the dash is brought up nearly to shoulder level in a flattened curve, which conceals from the man in the middle of the street all but the heads of the driver and his companion in front, and such part of their alleged anatomy as is popularly supposed to grow over the shoulder blades, but actually comes off with the coat in many instances. At the sides the top rail—the "gun'le" of

ing so contrived that the distance in front of the driver's face, as well as the height and inclination of the glass, may be regulated to individual taste. From the contents of the various compartments and cases in the tonneau to the silver plated trimmings and the bullet shaped side lamps, which are electrically lighted, all accessories are of special design and construction.

Less pronounced than either of the types so far mentioned, is the Knox body, which, nevertheless, has very high sides, a deep inclined hood over the dash, and an air of distinctiveness peculiar to itself. In the new Columbia, the top of the dash—the hood, properly speaking—is curved into general conformity to the bonnet section, and the sides are brought down in a sweeping curve below the doors which afford access to the front seat, in a way suggestive of the newest types of roadster. Here is plain evidence of evolutionary tendencies. For stripped of its doors to front and rear seats, the Columbia would match pretty closely with a number of very modern and snug-looking roadsters on the floor. With the doors, it is a very modest and clean-looking little torpedo. The same, in a general way, applies to the Selden body of the new sort, which, however, is prettily set off by crossed mouldings, which give a not unbecoming panel effect to the exterior. The torpedo design which is applied to the new White gasoline car, is even less radical in its proportions, and appears a natural and thoroughly rational transition from the true roadster to the enclosed torpedo type.

In turn, a rational and natural development from the convex dash of former years, the hooded or skuttle dash is a prominent

be declining in numbers, that is to say, judging solely on the basis of vehicles of the sort displayed at the Garden. There are, to be sure, the Palmer & Singer torpedo runabout, with its modern lines and snug interior, the unrivaled Winton creation aforementioned, the Franklin, with its high sides and enclosing top, and a number of others. But it is evident that the more conventional manufacturers have embraced

FRANKLIN TOURING CAR WITH TORPEDO BODY

the idea of interchangeability in body construction as well as in the more mechanical features, and have begun to treat the runabout, with or without the additional rumble, merely as natural phases of what may be termed the general utility type. It is not so very long since nearly every manufacturer staged the rumble runabout in one form or another. Now it is the custom to show preferably the four passenger roadster or the small detachable tonneau, and to trust to the experience of the visitor in such matters, and to the catalogue, for the

more nor less than a form of tame racing car. riation of the same idea though with a single rumble seat behind, which is mounted on a trunk, while the vehicle is fitted with full touring equipment in the shape of top, wind shield and other accessories. The speed car, regardless of size, it may be mentioned, is to be distinguished by the mounting of round or oval tanks back of the principal seat, as in the full fledged racing cars. Indeed, generally, it is nothing

WINTON ROADSTER WITH GUNBOAT BODY

feature of many roadster and runabout designs. It is found on the Locomobile, Haynes, Pope-Hartford, Chalmers-Detroit, Mercer, Overland, and, in a very conservative form on the Studebaker tourabout model. Its purpose is the worthy one of protecting the all-weather operator from physical discomfort while driving in wet and breezy weather, and also of protecting the few fittings which are left on the dash, from dampness and breakage.

As a distinct and separate entity, it may be observed that the runabout appears to

information that accommodation for two, three or four passengers, may be had merely by slight manipulation and a minor interchange of body sections in the back of the car.

The conventional two-passenger runabout, of course, survives, and it is ably defended in several quarters, though not to the same extent as formerly. There are, as examples, the Apperson, Marion, and Flanders, large, medium and small types of speed cars, respectively, while intermediate between them is the new Haynes, which is shown a va-

more nor less than a form of tame racing car.

Of the roadster class, meaning the new class of vehicle which has detachable rear seats, but which is exhibited in four passenger form, conventional examples are placed on the Overland stand among others, while instances in which more elaborate effects have been produced are found on the Matheson, Locomobile and Pope-Hartford stands, some cars of this class indeed, betraying absolutely no traces of such interchangeability as actually may exist. The white Pope-Hartford, in particular, is a neat and striking vehicle, with individual seats of similar form in front and rear, and possessing a sturdy outline which has both strength and beauty about it. The Studebaker tourabout is another of the same class, while the so-called suburban pattern, originally introduced on the Studebaker cars, now is carried out in neat and pleasing form on the new Flanders car, which, in its bonnet lines as well, reveals a touch of Studebaker influence.

The type of body in question is very like the surrey of carriage lore. As a matter of fact by some makers, roadster and surrey are held to be practically interchangeable. All agree, however, that by placing a door on either side behind, a small tonneau is created, though it sometimes is known by other and more fanciful names. This class also is much in evidence, and grades smoothly in point of evolution up to the five passenger touring car as exhibited in the Locomobile, Chalmers-Detroit, Haynes and other standard products. A particularly effective example of it is shown in the new Stearns 15-30 touring body, which is low, extraordinarily wide of rear seat, and somewhat suggestive of the phaeton, or even the cabriolet, if the side doors be overlooked for the moment.

With all the modern phases of body design, however, the truly standard touring car, whether designed for five or seven passengers, remains the mainstay of production, almost without exception, and really the characteristic stock type. Exhibiting more decided leanings toward straight line effects, but improved in many instances by the adoption of the cut-under rear seat form, whereby extra width is gained, effective and thoroughly standard types are shown among the exhibits of the Thomas, Matheson, Elmore, Autocar, Lozier, Winton and other makers.

Fittings and finishes, naturally continue to improve with the growing experience of the respective body building departments, many of which, contrary to former practice, now are incorporated directly into factory organizations. Much of the improvement in this direction naturally may be traced to the efforts of the accessory makers. In not a few instances, however, specialized fittings have been installed.

The most noteworthy example of this tendency is to be seen in the new and exclusive lamp designs, which a number of the makers have adopted this year. The selection of the more prominent accessories with a view to harmony with the general appearance of the car as a whole, is an important point, which has been overlooked by many builders in the past, but which promises not to be overlooked in the future. Among the cars in which are displayed either exclusive or striking lamp fittings, are the Corbin, Overland, Thomas, Matheson, Pope-Hartford, Packard and Alco. The Pierce-Arrow, Studebaker and Franklin, in particular, show electric as well as gas and oil lamps.

#### THE NEW CARS IN EVIDENCE.

New cars, such as the conventional show-goer lusts after and literally devours in his eagerness to catch at novel structural details, by no means are an overwhelming quantity at the Garden. Indeed, counting the new models produced by exhibitors of long standing, and the new models exhibited by companies which have gained admittance to the licensed fold since the last show, there are barely a dozen cars which can be called really new.

Unquestionably the most eagerly awaited of these newcomers, partly because of its joint origin with the noted E-M-F. car, which was first exhibited at last year's show, partly because of the remarkably low price at which it is made to sell, is the Flanders "20." Revealing at every point the refining hand of the experienced production engineer, and exhibiting the expected traces of economy in manufacture as well, it is, nevertheless, a most promising appearing little car. Its outward form, which is thoroughly in good taste, already has been mentioned. The chassis is no less pleasing.

Its block cast motor is of the conventional, vertical pattern, with the accessories

#### EXCLUSIVE LAMP DESIGNS

THOMAS                      POPE-HARTFORD  
STEVENS-DURYEA        STUDEBAKER  
PIERCE-ARROW

and valves on the left side, this arrangement providing ample room on the right for the large gravity oil tank and for the steering gear, which is bolted to the sub frame and motor at its forward support. The axle mounted form of change gear is used, as on the parent E-M-F. car; but only two forward speeds are deemed necessary, and they are actuated progressively by a lever mounted inside the frame and held by a stiff spring against a ratchet segment. The emergency brake lever, which is mounted coaxially with it also is held by a cross spring against a ratchet plate. The inverted cone type of clutch is employed, while by a most ingenious arrangement, a finger attached to the clutch yoke mechanism applies the service brakes, when the clutch pedal is fully depressed. The torsion tube, which houses the propeller shaft, is suspended in front, by a large sized ball and socket joint, which is carried by a cross frame member located just back of the clutch, and therefore well up in the waist of the car.

The frame is of substantial proportions, with a raised cross member, strongly suggestive of E-M-F. practice, in the middle section, and with a tubular sub frame by way of engine support, so contrived that the power plant may be demounted readily. The rear axle appears well proportioned, is original in design, like the remainder of the chassis, and carries the lay shaft above the driving member, while the pull-out rod which actuates the sliding member of the gearset, lies below the torque tube.

Its older sister car, the E-M-F., now entering upon its second year, counting from show to show, remains about as heretofore. The front axle has been redesigned and strengthened, a new cone clutch adopted, and—as a matter of course—the bodies have been slightly enlarged. Its general characteristics, however, the twin cast cylinders, oil tank located in the rear crank case support on the left side of the engine, double cardan shaft, and pressed steel torque rod, remain as in the original cars. The tire sizes have not been increased, and the wheel base remains unchanged.

A brand new car, exhibited for the first time at a New York show, and by a newly organized company, relatively speaking, of course, the merits of the Hudson are expounded with the aid of a most creditable sectioned chassis, polished and shown in operation. Being credited with 22 horsepower, this machine also belongs within the small car rating, despite its ample external proportions and nicely finished body work. The popular block type motor, selective sliding gear transmission and drive to the live rear axle, are its outstanding features.

With the valves and engine auxiliaries mounted on the left side of the car, the right side of the frame is left free for the mounting of the steering gear, well to the

KNOX MODEL "R" TORPEDO

KNOX MODEL "S" TOURING

front, in the position which is demanded by the inclined steering column. The pressed steel channel sectioned sub frame, which carries the power plant entire, is reinforced by a gusset plate, which joins it to the main frame for the entire length of the plant; thus affording rigid support for the engine and gearset, and also providing an efficient preventive of weaving in the principal frame members. Between the cone clutch and the gear box, a double cardan

One of the minor structural details worthy of passing mention, is the accelerator pedal arrangement, which is handily worked out. The pedal surface is in the form of a concave curve, the point farthest away from the operator rising to a sharp point. Such is the shape of the upper surface, that full engine control may be obtained merely by sliding the foot forward or back, without raising the toe from the footboard, but always keeping the edge of the sole against

The Marion cars have a well known type of four-cylinder motor, multiple disc clutch, original axle-mounted change gear, affording three forward speeds, and selectively actuated; and are of prepossessing appearance as exhibited in runabout and town car forms. The horizontal steering arm, brought back of the axle to protect it from injury, change gear actuating devices, quadruple, internal expanding brake system; and new style radiator, mounted on trunion sup-

shaft is introduced, while the single joint in the driving shaft, together with the torque tube load, is carried by the rear gear box bearing.

The gear box, due to the arrangement of the gears, is exceedingly short, and possesses the further advantage of enclosing the entire selective mechanism. Three-quarter elliptic suspension is employed in the rear, and the traction load is carried by the lower member at its forward end.

the curved pedal. The arrangement is as simple as it is convenient.

Never before exhibited in the Garden, though machines of considerable repute in the medium priced class, the Overland and Marion products are in the ranks of the new recruits. Although produced under a joint administration, and marketed by the same distributing company, the cars are distinctly different in form.

port, are among the new features now exhibited for the first time.

One striking peculiarity of the Overland, and one which is reputed to have gained many sales for it in the past, is the use of an all-pedal control system, on two of the three models. Use of a special and exclusive form of axle mounted planetary change gear, which has now served successfully for several years, permits the usual side gear controlling lever to be dispensed

SELDEN MODEL "T" TOURING

SELDEN MODEL "P" TORPEDO

OVERLAND MODEL "42" TOURING

MARION TWO-PASSENGER ROADSTER

with, leaving only the emergency brake to be controlled by hand. The 40 horsepower car, also may be equipped optionally with the conventional sliding gear system of the selective pattern. Magneto ignition as a stock feature; a redesigned and enlarged engine, larger wheels and longer wheel base prevail on the larger models. The 35 horsepower car, uniform in general style with the larger model save that the pedal

by reason of its very existence, the White Co. now is numbered within the licensed aggregation. It has the latest type of block motor, in improved and specialized form, with only the magneto mounted on the right, while owing to the general simplicity of the design, the housing of the valve springs and tappets and the absence of needless parts, the space on the left hand side appears to be almost equally free from

and compact oiling system, however, which is of the splash order, with automatic replenishment through two sight feed glasses on the dash, the reservoir being located in the rear crank case supporting arm, on the left side of the car.

A new car, exhibited by a new company, but succeeding directly to the license and good will of an old established concern, the

## THREE NEW TYPES OF BLOCK MOTOR

FLANDERS

HUDSON

WHITE

control is exclusively employed, is new this year.

A first product in the way of gas engine propulsion, though of an ancient and honorable line, the new White car, is still another of the debutantes. Externally conforming in some respects to the standard White lines, long ago standardized in the steam car which bears so enviable a reputation, it reveals a number of mechanical points which are well worth studying. The car is further noteworthy as a newcomer, since

encumbrance. Unusual on so small an engine, but none the less useful, is the compression relieving device, which is mounted on the dashboard, and which operates by moving the exhaust cam shaft endwise in its bearings.

Selective type change gear, double cardan shaft drive, three-quarter elliptic rear suspension, with spring drive and the lower member set a trifle off center to obtain a reduced radius rod effect; are the remaining noteworthy features of the chassis. Special mention should be made of the simple

Mercer enters the popular medium priced ranks. In general it possesses no strikingly radical characteristics, having the conventional four cylinder motor, selective gearset and shaft transmission. A particularly solid-looking rear axle is employed, together with double cardan propeller shaft, triangular torsion rod, hinged in the vertical plane at its point of attachment to the differential housing; and radius rod drive. In connection with the suspension equipment, which is of the three-quarter elliptical pattern in the rear, considerable stress

NEW COLUMBIA IN TORPEDO FORM

CORBIN MODEL "18" AS A ROADSTER

is laid upon the fact that the traction stresses are absorbed by the radius rods, and not by the springs themselves, as is done on many cars of equivalent type. The argument is that where the springs carry the driving load in addition to the dead weight on the chassis their action must be very materially interfered with and rendered less free.

In connection with the 44-disc clutch, which is unusually powerful, considering the weight of the car, a special intermediate reducing linkage is introduced between the foot pedal and the throw-out yoke. By means of this additional leverage, the pressure of the 160-pound engaging spring is reduced to only about one-third of that amount, it is stated. The braking strains are balanced by equalizing levers, and all tension rods are carried inside the frame.

Rated as a new model, because it has not before been exhibited in the Garden, the new Haynes is a particularly sturdy little car, which exhibits in chassis formation a number of radical departures from the former practices of its long-experienced builders. To those who have been familiar with the former Haynes products, one of the most noticeable of these is the adoption of the conventional rear axle construction, with double cardan shaft, together with a very long pressed steel torque rod, which is anchored to the rear of the power plant. Another change involves the entire redesign of the engine and change gear system and the adoption of a particularly stable looking unit power plant of the sectional type. The gear box is made integral, with staunch, boxed members which are bolted on either

and an old and familiar Haynes feature, is the contracting band clutch, one of its numerous advantages being that the elasticity of the steel band permits it to free the fly wheel drum absolutely when disengaged, thus providing an absolute release as well as for smooth engagement. Lubrication is accomplished by forcing oil from a pump on the right side of the motor through a

different weights. Upon opening the throttle the increased suction causes these valves to unseat progressively, this bringing into action the jets which lie beneath them. At low speed and small throttle openings the supplementary valves are held to their seats by a cam device.

The new P-S town car chassis is another new feature on the same stand. In many

HAYNES NEW MODEL "19" TOURING CAR

single sight feed glass on the dash, and ways it resembles its predecessor, but a then along a special conduit which is carried along side the ignition cable support to the forward end of the motor and fed into the gear housing. From that point it is circulated through the engine automatically.

Exhibiting for the first time their new motor, the first to be made directly under the supervision of the company's engineering department, Palmer & Singer, for the first time also, appear under their own license. The new motor is of conventional

different style of rear axle coupling considerably alters the general arrangement of parts. A substantial-looking gear box is mounted well forward in the chassis, just under the foot board, while back of the cross frame member, which supports its rear end, is the trunion support for a long torsion tube, housing the propeller shaft. This style of construction is new to these particular constructors. Rather an unusual feature of the axle construction is that the brake rocker shafts, applying both expanding brakes in the rear hubs, are carried behind the axle tube, to a point well inside the frame, from which the tension rods are led to equalizing bars. Steering arms brought over the axle, double universal joints, replacing the common ball and socket connections in the steering rods; and small sized grease cups mounted on every important articulation in the whole chassis, are other features of merit on the car. An important structural point on all cars of this make is the use of ball and socket radiator supports, which form an important means of protection for the constitutionally delicate cooler.

NEW WHITE GASOLENE TOURING CAR

side to rear extensions of the crank case, the arms in question spanning the fly wheel and forming, with the engine, a complete unit. The cylinders, which are cast in pairs, and are of T-head construction, are equipped with large valves, liberal jacket allowances, and large intake and exhaust manifolds with siamesed connections at the cylinders. The plant complete includes not merely the motor and change gear device, but also the engine auxiliaries complete, the steering gear, and the clutch and brake pedals.

One element which is out of the ordinary

pattern, save for the enormous size of its valves, and the attendant port design, which is thought to add much to its satisfactory pulling abilities. In connection with the motor, which is shown in both four and six cylinder forms with cylinders cast in pairs, there is shown the new P-S carburettor, which is a triple jet affair. Three venturi tubes are clustered about a common centre within a cylindrical housing; one, which has an adjustable jet, being in action at all times, while the other two are closed at the top by poppet valves of

Although exhibiting for the first time, the Columbia Motor Car Co. is a direct off-spring of the Electric Vehicle Co., which, as original purchaser of the Selden patent, and one of the pioneer concerns in the American industry, long maintained a position of prominence in its annals. The new Columbia cars, being direct developments from the final and excellent product of the "E. V. Co.," as it was familiarly known, are not exactly new productions. At the same time, the standard chassis has undergone a number of alterations which entitles it to more than the passing consideration which mere improvements of a minor nature usually warrant.

STUDEBAKER AUTOMOBILE CO.

MATHESON MOTOR CAR CO.

H. H. FRANKLIN MFG. CO.

F. B. STEARNS CO.

Of generally standard proportions, rated at a little over 32 horsepower, and having the shaft drive and other familiar features, it yet possesses a number of original and unexpected elements, several of which are new at this time. Among them may be mentioned the quadruple ignition system. The Columbia is one of the three makes of cars on the floor to have the make and break system of ignition in its simplest form. Electrical energy for the spark may be secured either from the low tension magneto, which is part of the quipment, or from a storage battery, which also is carried regularly on the car. In addition to the make and break system, the Seeley high frequency system is employed, with jump spark plugs. Energy for this system may be obtained either from the magneto or the bat-

HUDSON WIND SHIELD

tery. Thus there are virtually two dual systems in use, or practically four in all.

The motor sizes have been increased since last year, thus necessitating some strengthening of dependent parts, such, for example, as the rear axle and propeller shaft. The valve springs and lifters are now completely encased behind removable covers; the general appearance of the motor has been altered by the adoption of a form of squared induction pipe; and a new and larger radiator has been adopted. Rather an unusual feature is the use of a wood-filled cross-frame member just back of the dash, upon which the floor boards rest, and which, like several other stay members in the frame, is of channel section through the greater part of its length, but is flattened out at the ends for riveted attachment to the main frame members. Adjustable pedals of the disappearing type, and an original form of foot accelerator, so contrived that it can be operated without the need of removing the foot from the toe board, are others of the new points to be observed.

Although known to have been under construction for some time, the Peerless 20 horsepower town car makes its initial public appearance at the show. It is provided only in enclosed types, as limousine or landaulet. That it was designed exclusively for this use is evidenced by the adoption of left hand control, with the brake and gear shifting levers mounted in the centre of the floor board. The motor is of quadruple pattern,

HAYNES TRANSMISSION

with cylinders cast in pairs, and in general bears a close resemblance to the standard touring car of larger power and price. One noteworthy point of difference in motor construction, however, is the arrangement of the valves, which, on the smaller car, are mounted on the left side of the engine. The larger models of this car, in both four and six cylinder sizes, remain practically as hitherto. The expanding band type of master clutch, tapering intake manifold, with extra air inlet valve located at the junction of the Y-shaped distributor section, and other exclusive features being retained.

The new Selden model, while in many respects a direct successor to the standard

COLUMBIA ADJUSTABLE PEDALS

product of last year, has undergone a general expansion and enlargement such as to merit for it designation as a new car. In addition to the distinction of being named after, and produced in the interests of the originator of the Selden patent, and so occupying a position of semi-official honor in the show, the Selden also is claimed to be the first American car to be equipped with a true torpedo body.

Formerly rated at 29 horsepower, the cylinder dimensions have been increased to  $4\frac{3}{4}$  by 5 inches, as against  $4\frac{1}{4}$  by  $4\frac{1}{2}$  last year; thus bringing the rating up to 36 horsepower by the A. L. A. M. formula. The wheel base has been increased a couple of inches, on the roadster model, and to 122 inches on the seven-passenger touring car. The mechanical arrangement of the chassis, also has undergone considerable alteration. The power plant is carried on a sub frame, which is extended further back into the waist of the chassis than ordinarily, thus affording support for the cylindrical fuel tank, which is permanently mounted on it. A new type of selective gearset has been adopted, together with a new carburetter of standard pattern, while the operating leverage between the disappearing foot pedals and the cone clutch has

CHALMERS-DETROIT DASH

been increased to relieve the foot of the driver. Externally, the appearance of the car has been altered somewhat by the adoption of a new style radiator.

#### NEW FEATURES OF OLD CARS.

Around the arena and on the elevated platform, a majority of the manufacturers are displaying cars, which, though they may be known by other designations than were employed last year, are close successors to them in regard to most of their specifications. With such, the interest of the hurried showgoer focuses first on the more striking and original peculiarities, and second on any possible innovations which may have been introduced during the interval since the Garden last housed an A. L. A. M. show.

Franklin cars, for example, are produced, as heretofore, in three different chassis sizes, which are uniform as to general structure, and which possess, as unusual qualifications, laminated wood frames, full elliptic springs and air-cooled motors, which are

POPE-HARTFORD SEVEN-PASSENGER TOURING

POPE-HARTFORD MODEL "T" LANDAULET

of peculiar and original construction. Following a practice which was tried out successfully on one model last year, all models now are equipped with magneto ignition, together with set spark control, whereby the operator is relieved of all responsibility in regard to the regulation of the ignition. Larger tires prevail on all models, the 42 horsepower touring model having the unusual combination of 36 by 4½ in front and 37 by 5 in the rear.

The conspicuous feature of the line, however, and, indeed, one of the most remarkable and radical developments presented anywhere at the show, is the motor itself. Into this has now been incorporated a new and most ingenious method of securing uniform distribution of air over the heated surfaces of the cylinders. By forming vertical radiating flanges on the cylinder walls, and surrounding them with light metallic jackets open at top and bottom, but fitting tightly into an air-tight deck which subdivides the engine space beneath the bonnet, two separate compartments are formed; the only avenues of communication between which is through the spaces between the radiating fins on the cylinders. A powerful exhaust blower, which constitutes the flywheel and the driving portion of the clutch as well, creates a strong suction in the lower of the two compartments, causing an inrush of air from above. The engine is further distinguished as possessing the only form of concentric valve which ever has come into

regular use upon a stock machine. This feature, which is of several years' standing, together with the use of auxiliary exhaust ports in the lower portion of the cylinder walls, constitute the more striking elements of the motor.

Another engine, which is considerably out of the ordinary, both in theory and in manner of achievement, is mounted on the

FRANKLIN ENGINE

Elmore model "46," which, though not exhibited in chassis form, is to be found on at least two of the complete cars which are on the stand. Like the older Elmore motors, one of which is continued in four-cylinder form from last year, it is of the two-cycle type. Its particular claim to distinction, however, rests on the fact that the differential type of piston is employed, or that in which a double piston of two different diameters, fits into a cylinder which is

correspondingly counterbored; and also in the use of a rotary valve or distributor, for handling the charges. Though there is little externally to indicate its nature and construction, it is readily understood, when it is explained that at each up-stroke of each piston, a charge previously inducted into the annular compartment surrounding the lower part of the piston, is compressed and forced through the distributor, which is in the form of a small revolving drum close to the crank case, to another cylinder, which is just ready to receive its fresh charge. The distributor is divided longitudinally into two compartments, one for drawing live gas from the carburetter, and the other for distributing the compressed charges to the cylinders. The action within the combustion space of the cylinders is precisely the same as with the ordinary three-port type of engine, save that the gas is received under higher tension than is possible ordinarily with crank case compression. The engine is neat and compact, and presents a clean exterior.

In the complete chassis, two Elmore models are produced this year. One of them replaces a three-cylinder model of last year, in point of price, but has practically the same four-cylinder engine as was used in a more expensive machine of last year's build. The "46" is an entirely new car. Changes in chassis construction which have just been brought out, include the adoption of the three-quarter elliptic rear suspension,

P-S SIX-CYLINDER SMALL, TONNEAU

P-S TOWN CAR EXTENSION LANDAULET

enlarged brakes, increased frame sizes, improved cone clutch and larger tires.

Matheson cars are among those which are reproduced this year with no changes of any sort announced. The four and six cylinder motors are of entirely different design, the former having the characteristic valve-in-the-head construction, together with an original form of carburetter, and make and break ignition. The latter is of more conventional pattern, also with valve-in-the-head motor, though of a totally different type. The methods of driving by side chains and shaft are exemplified on the two models also. The six-cylinder car, in particular, has a very strong example of good design in its axle-mounted change gear. The method of extending flanges from the sides of the crank case to meet the side frame members, and also the axle and torque tube construction noted, are exclusive and sterling features.

A 4-inch increase in wheel base, 36-inch wheels, instead of 34, and longer springs, constitute the visible alterations in the Pope-Hartford chassis. In addition to this, however, sundry structural details have been changed. The new oiling system which has been adopted is unique. In addition to a standard form of mechanical lubricator, a supplementary pump is added, which draws from a sump underneath the crank case, into which is filtered all overflow from the case. An overflow pipe in the lubricator reservoir serves to regulate its contents to constant level, the device thus being kept at work under absolutely constant conditions. A new trussed, tubular torque rod also has been added to the chassis, which is hinged to the axle housing at the rear, and suspended from a cross frame member in front by means of spring buffers. Adjustable radius rods absorb the driving strains by the new arrangement, while the springs are swiveled on the axle tubes, and are shackled at both ends.

Locomobiles, long distinguished alike for the uniformity of their performances and the unchanging quality of their design, show no symptoms of abatement in either respect. The third product in the show to be equipped with make and break ignition, they are distinguished as the only product for which the entire ignition system, as well as the bulk of the car, is produced in the plant of its origin. Save for an increase in the size of the brakes on the 30 horsepower, shaft driven model, and some trivial alterations to the larger, chain driven car, no changes are recorded.

Without abandoning the original form of power plant which has been employed on the Knox cars for several years, a considerable modification of design has been effected, such that the gearset now is reduced to about its lowest conceivable terms, in point of external dimensions. The shafts,

it may be mentioned in passing, are of hardly more than 5 inches swing between bearings. The model has been increased in engine dimensions, and it is rather noteworthy that it is of the short stroke pattern, having cylinder dimensions of 5 by 4¾ inches, bore and stroke, respectively. Although the unit power plant structure is retained the gearset now may be demounted independently of the engine, while

KNOX IMPROVED TRANSMISSION

a number of minor changes, such, for example, as the introduction of safety pump-drive, intended to prevent damage to the circulating pump in the event of a freeze-up in the water system, having been effected. An unusual feature which may be mentioned in connection with the engine is the method of driving the pump and lubricator by means of short, transverse independent shafts, which are actuated by spiral gears from the cam shaft. The valve-in-the-head motor construction is retained.

The new dry-plate clutch is one of the chief alterations introduced in Stearns practice at this time—in fact, it is practically the only innovation. The 30-60 horsepower model is equipped with it, and the change is thought to be an exceedingly beneficial one. Briefly, the idea is to secure the uniformity of action of the cone clutch, with

STEARNS DRY PLATE CLUTCH

the "sweetness" of the multiple disc pattern, merely by altering the construction of the latter to permit of the introduction of a special asbestos fabric. The result is an assemblage which runs without lubrication, and which is of true multiple disc form. The clutch is of large diameter, and is engaged by means of a half-dozen helical springs

spaced around the outer spider. Either double chain or shaft drive may be had with this model, but only the shaft-driven form is on view at the show. It has a strongly mounted, selective gearset, heavy torque tube construction, and a new rear axle, which follows the general lines of the type introduced on the 15-30 model last year. In this a heavy steel forging forms the body of the member, with the differential and gear housing supported within a diamond-shaped opening between its upper and lower branches. This design, which is a particularly strong one, is original, and in the smaller car is used to support an axle-mounted change gear. The double jet carburetters used on the Stearns cars are exclusive in design; and in point of ingenuity are thoroughly in keeping with the ingenious and intricate engine base castings which are used on both motors. Demountable rims are a new feature of the standard equipment now employed.

By an unusually clever method of coring, the new gearbox of the Lozier cars is poured into a single casting, with openings for one cover plate, and the large annular bearings which support the shafts. This construction, and sundry minor modifications in the design of the gearset, constitute the principal alterations in the chassis, saving the new radiator, which is of honeycomb type. The unit power plant form of construction is employed, the engine and gearbox being bolted strongly together. At the same time, the unit is so tied to the frame that that important structure is considerably strengthened by it. Combination gas-electric lamps and demountable rims as stock equipment are worthy additions to the latest specifications of these solidly built machines.

Characteristic practice which is continued in the case of the Corbin, along with practically all other original features of construction, is the use of a heavy steel plate which extends from the lower edge of the side frame members to the unit power plant. Besides furnishing ample support, this arrangement greatly strengthens the frame itself. The wheel base of the standard chassis has been increased from 108 to 120 inches, three-quarter elliptic suspension has been adopted in the rear, the two-to-one gears have been housed, and a few other changes of a minor nature introduced. In the main the car is not materially altered, however.

A massive and most admirable forging, constituting the basis of the new rear axle, is the most striking alteration in Alco construction. Adapted from the design which has worked out so well in the Alco town cars and taximeter cabs for several years, the new axle, which is an incident to the abandonment of side chains in favor of shaft drive, is one of the most solid equipments to be seen at the show. Tapered at the

CHALMERS-DETROIT "30" WITH SMALL TONNEAU BODY.

WHERE LOCOMOBILES ARE STAGED IN THE ARENA.

STUDEBAKER-GARFORD 40 HORSEPOWER TOURING CAR

ends to economical proportions, the centre section of the main forging is enlarged in the vertical plane to form a large ring. The cast steel differential and bevel gear housing, which also supports the rear end of the torque rod, is bolted to the front side of this, while the rear position is enclosed by a cast aluminum cover. Other alterations include the abandonment of the engine governor, formerly employed; the improvement of the clutch, which now has a braking device to prevent spinning when disengaged; and the adoption of a trunion support system for the radiator.

The only makers in the show to equip all stock models with a mechanically driven air pump for tire inflation purposes, the Pierce-

PIERCE-ARROW AIR PUMP

Arrow Motor Car Co. thereby has added considerably to the laurels it already possessed. The three sizes of the six-cylinder product, which is the only one produced, have been considerably increased as to engine dimensions, without other material change in the power plants. Wheel bases have been lengthened out noticeably and the tire sizes have been increased. On the 66 horsepower touring model, the present specifications call for 37 by 5 inch tires in front and 38 by 5 in the rear. This is an increase of one inch diameter in front and two in the rear, as compared with last year. In common with a very few others of the more advanced manufacturers, the Pierce-Arrow Co. equips all cars with combination gas-electric lamps.

Continuing the successful block motor and unit power plant construction which is original with the car, the latest forms of Chalmers-Detroit are somewhat enlarged, but otherwise little altered. The cylinder bore has been increased  $\frac{1}{8}$  inch, raising the rating by formula from 24 to 25.6 horsepower; the wheel base has been increased 5 inches. Housing the gear-shifting mechanism, removing the lubricating pump on the motor

to a more accessible position on the left side of the crank case and in the rear, and installing a new form of foot-accelerator, of the popular sort which relieves ankle strain, summarizes the improvements which have been found necessary. On the Chalmers Forty, an 11-inch increase in wheel base and a 2-inch increase in tire diameter have been introduced, as well as a new form of hinged, triangular torsion member; a remodeled gearset and a new clutch throw-out linkage, which is of somewhat increased leverage.

Thomas Flyer models "F" and "K" remain practically unchanged. Model "M," however, is considerably altered. Summarized, the changes on this one model are: Long stroke motor ( $4\frac{1}{2} \times 5\frac{1}{2}$  inches bore and stroke); cylinders cast in pairs, with valves on opposite sides; valves one-half the diameter of the cylinders; one-piece crank case; longer wheel base; shaft drive, with gearset mounted in the waist of the chassis; full-floating axle; larger frame; larger tires (36 by  $4\frac{1}{2}$  inches); larger brakes; ball and socket joints on small control mechanism; stronger and more compact transmission and less noisy action due to closer fits, reduced valve clearance and improved workmanship. It is this chassis which so successfully submits to the washing machine motion of the Thomas stand in the Garden, and which, therefore, comes in for perhaps closer inspection than any other single vehicle in the show.

Distinctive in its use of the magnetic plug, which effects the same sort of spark as the mechanical make and break ignition system, the Studebaker-Garford cars remain apparently unaltered as compared with last year. The mounting of the mechanical oiler under the incline of the floor board, so as to free the dash of all contrivances and leave it perfectly plain; the three-quarter platform rear suspension, solid torque bar construction and radius rod drive, are points of originality which are standing the severe test of continued service.

Stevens-Duryea is another name intimately associated with constancy in automobile design. Six years ago the unit power plant idea first was expressed in this car. Today it remains practically unchanged, and unapproached in its originality. Principally displayed in the "X" and "Y" models, which are of six cylinder construction, the same principle also is applied to the four-cylinder model "AA," which is shown in chassis form. Mounting the crank shaft and gear case in the form of one long housing of tubular section, carrying the cylinders upon the forward part of this structure and mounting the whole on three points, are the basic ideas upon which the plant is based. In structural refinements, it is worked out to a fine point of accessibility and direct action. The use of three-quarter elliptic rear suspension on the show chassis, is practically

FRANKLIN SEVEN-PASSENGER TOURING CAR

"TUMBLING CHASSIS" EXHIBIT OF THE THOMAS CAR

STEARNS FIVE-PASSENGER TOURING CAR

the only noticeable structural change in the entire line.

Winton cars now are equipped with a brand new carburetter, which is one of a very limited number of innovations. It is of the single jet type, simple in construction, and minus any attempt at automatic regulation of the air component of the mixture. Instead, a double throttle arrangement is provided, together with interconnected control. A four-speed gearset is now employed, instead of one having but three; the wheel base has been increased by a small amount, and semi-elliptical springs of enlarged proportions are used to support the chassis. In original design, respecting the six-cylinder motor, self-starting device, and other characteristic features, the car is unchanged.

Setting up a straight-front, square-cornered dash, in place of the characteristic convex member of former models, lengthening the hood and slightly altering the outline of the fenders has more than slightly changed the external appearance of the Royal Tourist. Beneath the surface, however, it remains practically the same as hitherto. One recent addition is in the way of an oil filtration device, which, together with modifications in the lubricating system is thought to have improved the action of the machine from the standpoint of reliability. Such original features as the differential gear arrangement for equalizing the brakes, the heavy rear axle system and the large and expensive cylinder formation, are retained practically without change.

Introducing the dry plate clutch, Packard cars reveal even fewer changes than has usually been the case since the one-design policy was adopted some years ago. Among the limited number of alterations disclosed at this time, may be mentioned the altered arrangement of the gear shifting lever, whereby it is given a selective action in the control of the exclusively designed axle mounted gearset. The use of a protecting tube for the primary wiring between the battery and coil boxes, and a "kick-switch" on the coil box, are new, as are mud guard and apron extensions on the standard chassis, and a generous enlargement of dimensions in the rumble seat for the bodies in which that item is included. The hydraulic governor, Eisemann ignition system, special carburetter and other original features are retained.

Among other cars which appear without ostensible improvement upon previous construction, may be mentioned the Autocar and Simplex. The Oldsmobile, which, on the four-cylinder model, now has longer wheel base, larger wheels and a four-speed change gear system; is mounted, when it comes to the six-cylinder creation, on 42-inch wheels—the largest in the show. Throughout the line, dual ignition, three-quarter elliptic rear springs and combina-

tion gas-electric lamps as standard equipment, are rated as new. Cadillac cars, which nominally have remained unchanged for some little time, now have more power than before, due to a quarter inch addition to the cylinder bore; longer wheel base, larger tires, and a new axle equipment. An enlarged radiator, a redesigned and more satisfactory change gear system, and an improved steering gear, have been added to the Buick 30 horsepower model.

Apperson cars are equipped with a new semi-floating axle, which is of original design and constructed at the home factory of the Jack Rabbit and its companion products. A four-speed change gear on the 50 horsepower model, a newly designed drop frame, which enhances the body design not a little, together with slight improvements in brake construction, comprise the more important alterations in the line.

#### AMONG THE ELECTRICS.

After the riot of gold and color in the "Roman amphitheatre" there is almost a solemn hush of somberness in the prevailing glistening black which constitutes the

WAVERLEY ELECTRIC ROADSTER

exterior finish of most of the vehicles to be found in the section devoted to pleasure electrics, this section being in a room by itself to the right of the main lobby. The effect is somewhat accentuated by the fact that the aisles, instead of being packed with struggling crowds, are peopled with sedate persons who move slowly from car to car in stately dignity. When one is really in the midst of them, however, it is possible to discover in the electric showing some relieving color effects which make it very plain that the electric need not always be in modest black.

An electric "roadster" in cream yellow is the first eye catcher in a color way that is encountered, and it has its place almost in the center of the space of the Waverley Co., of Indianapolis, Ind. The machine is on exceedingly gasoline-ish lines, and boasts a runabout top and a folding wind shield. Its "juice" equipment is 32 Exide cells, which are claimed sufficient for a speed of 27 miles per hour or for 75 miles of travel in ordinary service. A victoria, a four passenger brougham, a two passenger coupe and a Stanhope bearing the Waverley brand, likewise are on view. A demonstrating motor and controller set finished in nickel serve to make clear the merits of

the Waverley drive system and the safety provision which prevents the car from being started except from the neutral lever position, which constitutes one of the Waverley's "talking points." The presence of an electric braking device for use in high speed emergencies also is disclosed, as an exclusive Waverley feature.

Three models constitute the representation of the Columbia Motor Car Co., of Hartford, Conn., in the electric section. The company, which is a reorganization of the Electric Vehicle Co., has a long lineage in the electric field, and offers types which are products of ripe experience. These include a Mark 68 brougham, with 44 cell equipment; a Mark 70, Lot 2 victoria phaeton with 24 cells, and a Mark 75 victoria phaeton with 24 cells. The latter model has a pressed steel chassis which permits the removal of the phaeton body and its replacement by a coupe landaulet body, of which one is shown unmounted. The Mark 70 is a continuation of the construction where no chassis underlies the body, the spring horns or dumb irons being fastened directly to the body. This method is so economical as to permit a popular price on the model embodying it.

An exposed chassis gives opportunity for examination of the motor and drive mechanism of the Baker electrics, and the arrangement of the running gear. Shaft drive to bevel gears is the characteristic, and by the fitting of a new form of spring shackle, the use of torsion rods is avoided. Five Baker models, made by the Baker Motor Vehicle Co., of Cleveland, O., are arrayed in full panoply of body and trimmings. Two of these, including a racey runabout and a runabout coupe, having wheel steer with current control lever on the steering wheel. Both have 30 cells. An extension front coupe with gold mountings and an interior upholstered in golden bronze brocaded satin, with silk curtains and draperies, presents an example of electric luxury, but is rivalled by a straight front coupe finished in red silk velour. These are 28 cells. A victoria phaeton completes the group.

Striking in a pure white finish, the Model Twelve "roadster" exhibited by the Babcock Electric Carriage Co., of Buffalo, N. Y., also is very much to the petroleum distillate in its general appearance, and it is claimed to have a maximum speed of 30 miles per hour on its 42 cells. The latter are represented as having a capacity of 100 miles at 17 miles per hour under the best conditions. The company stages likewise a Model Six victoria, a Model Ten three passenger coupe, a Model Eleven seven passenger town car and a Model Fourteen four passenger coupe. The latter is a new model, not heretofore present in the line. The novelty is chiefly in the body and a wheel steer with break joint, allowing ingress or egress from either side. Double chain drive is

the construction on all the models, the latter having exclusive Babcock features in a safety foot control which is declared to be highly efficient in preventing accident, and an anti-theft or safety Yale lock device which is incorporated in the starting switch.

Borrowing from gasoline car practice not in respect to motive power or outside appearance, but in some of the constructional features of the rear axle and the expansion hub brakes, the Studebaker Automobile Co.'s offerings, which consist of two victorias, a landaulet and a coupe, are to be differentiated from other electric vehicles of the same general class by the fact that they have full floating rear axle mounting in connection with chain drive, and rear wheel drums which take internal as well as external braking friction. The driving or floating axle is not required to do anything other than rotate the rear wheels. It is connected to these by means of dog clutches fitted with square sockets. The driving axle floats free in the housing and does not come in contact with anything except the sockets in the differential and in the dog clutches at the wheel end. Particular emphasis also is placed on the battery trays of the vehicles emanating from the big South Bend (Ind.) factory. The metal bands of the trays completely surround them and the metal corner irons reach from top to bottom. The Studebaker controlling system has an interlocking device which prevents throwing the switch which completes the circuit between the motor and the batteries unless the controller is at neutral. A Yale lock also is applied to the controller making it impossible to move the latter when the key is removed.

An entirely new model has been produced by the Woods Motor Vehicle Co., of Chicago, Ill., and it has its first disclosure at the Madison Square Garden show. It is styled the No. 12 brougham, and two examples of it are shown, each equipped with 40 cells. A No. 10 brougham and No. 100 Queen Victoria make a quartet of Woods offerings.

Three sets of brakes instead of the customary two are provided in the Detroit electrics, made by the Anderson Carriage Co., of Detroit, Mich. In addition to an internal expanding hub brake there is a brake on the motor and another on the ends of the countershaft. Victoria models A and B are displayed, together with a four passenger Model D brougham.

A chassis construction which permits a great variety of body changes on the interchangeable system distinguishes the cars of Rauch & Lang, Cleveland, O. Four complete cars in four types of body are put on view, including a victoria, extension coupe, landaulet and runabout, the chassis being identical.

Three makes of electric commercial vehicles are on view in the basement, includ-

ing Studebaker, General Vehicle and Baker. An exposed chassis of the Studebaker Model 26 is at the front of the space of the Electric Vehicle Department of the Studebaker Automobile Co., South Bend, Ind. It shows the general construction employed in all the models from one to five tons, and is marked by double motors giving an independent drive to each rear wheel. Two sets

WAVERLEY VICTORIA PHAETON

STUDEBAKER STANHOPE MODEL

STUDEBAKER ELECTRIC LANDAULET

of brakes are provided, one set applying to the motors and the other to the rear wheels direct. The carrying crate for the batteries is suspended on coil springs in its relation to the frame, relieving the cells from minor vibration which might not be taken care of by the main springs when the vehicle is running light. The Model 26 is also shown complete with delivery body, a Model 20-14, complete with 44 cell Exide equipment and twin tires in the rear, mounts a rack side body. Its normal capacity is two tons. Westinghouse motors are utilized, in connection with the new Westinghouse "continuous torque" controlling system. Because it is impracticable to subdivide so small a motor unit, a single motor is fitted on the Model 25, which is of 850

pounds capacity, and has 26 cell equipment. The Baker exhibit comprises a 1,000 pounds truck and a chassis of the ton truck, while the General Vehicle Co. shows two of its heavy service electric trucks.

#### IN THE COMMERCIAL SECTION.

Little alteration from last year is disclosed in the Hewitt two ton truck, made by the Hewitt Motor Co., of New York (which shortly will become the Everitt Motor Car Co., of Detroit), although a variation has been made here and there with a view to a perfection of the details. The motor, as before, is of the double opposed type, and is rated at 24 horsepower, the cylinders being  $5\frac{1}{2} \times 5$  inches. Planetary transmission is continued, the control being entirely by pedals and a throttle button. Fixed spark permits a complete clearing of the steering wheel. Square axles are used, front and rear. Plain solids,  $34 \times 4$ , are the front wheel equipment, while the rear wheels have dual blocks,  $34 \times 3\frac{1}{4}$ . The drive is by side chains. Both the oiler and the magneto are actuated by a spiral gear shaft, and the radiator is protected by a frame and helical spring mounting. For the ten ton Hewitt truck the four cylinder motor has been redesigned to some extent, its characteristics being very long pistons and connecting rods, to give a low angle of pressure on the pistons. The latter can be removed from the cylinders without dismantling the engine, by opening doors in the side of the crank case. The dimensions of the engine,  $4\frac{1}{4} \times 5\frac{1}{2}$  inches, give a formula rating of 28 horsepower, but 36 brake-horsepower is claimed. Two forward speeds and a reverse are supplied by planetary transmission, and the same simple control obtains as on the lighter truck that is shown.

The three ton Alco truck of the American Locomotive Co., of Providence, R. I., which stands alone in the company's space in the commercial section, is a large affair, measuring 197 inches over all, with a wheel base of 110 inches. The four cylinder motor is the same as used in the Alco cabs. It is located under the foot boards, which with the seat are located on a bridge-like structure which just clears the tops of the cylinders. Removable side shields make the motor readily accessible from the sides. The bore is 3 15-16, while the stroke is quite long in proportion, being  $4\frac{3}{4}$ . The governor being set for 1,000 r.p.m., the engine can develop 24 horsepower. Selective transmission, three forward and a reverse, is fitted. The length of the loading space is 12 feet with the standard body, the width being optional. Drive is by side chains. The truck, which sells for \$3,500, weighs 5,200 pounds with everything on. Solid tires are used, the equipment for the rear wheels being twins,  $36 \times 3\frac{1}{2}$ , while the front tires are  $36 \times 5$ .

Worm drive remains as a characteristic

of the Franklin 2,000 pounds truck, the type L-4 being shown. The new Franklin motor and air cooling system, by which the air is drawn down around each cylinder through jackets by means of a sirocco fan fly wheel, is employed, the 18 horsepower engine being used. In addition to the full ellipses in front and the semi-ellipses in the rear, coil springs are used both front and rear. Pneumatic tires are the regular equipment, these being 36x5½, with quick detachable rims. The space also shows two other products of the H. H. Franklin Mfg. Co., of Syracuse, N. Y., these being a cab and a fire chief's speed car, both shaft driven, but by bevel gears instead of a worm. The former is on the 18 horsepower chassis, while the fire department car, which is painted a brilliant red and is equipped with axes, lanterns, chemical tanks and other light apparatus, is on a 28 horsepower Franklin chassis. Stout brass railings around each of the four bucket seats, for the occupants of the latter to grasp, indicate the speeds which the car is expected to make at times when it is put in service.

Several radical changes have been made in the Thomas taximeter cab, made by the Thomas Motor Cab Co., of Buffalo, N. Y. The hood has been altered to the Renault type, with the radiator up at the dash. The control levers have been placed in the center, operating directly down into the gear change, which no longer is on the rear axle, but which has the gear box forward underneath the floor boards. The driver's seat is on the left, so that the levers are at his right. The steering wheel has been freed of both spark and throttle levers. The spark is fixed, a magneto being used, and the throttle is controlled entirely by a foot button. The one pedal which accompanies the throttle button operates both the clutch and the brake, so that the whole control is of the simplest. An increase has been made in the wheel base, from 103 to 108 inches, and the general construction of the axles and frames is of a heavier order than before. Retaining the block type motor, the cab has a rated capacity of a little over 18 horsepower by the A. L. A. M. rating, though the cylinder dimension, 3¾ x 4.5-16, indicate the long stroke which must be taken into account. Thermo-siphon cooling is used. The exhibit includes both the chassis and a complete cab.

Taking into account the "slap-dash" and

careless methods of many drivers of commercial vehicles, the Autocar Co., of Ardmore, Pa., has incorporated in its 18 horsepower, 3,000 pounds, shaft drive motor truck an attachment which prevents the "slamming in" of the clutch, such as might result in sudden jerks. When the clutch pedal is entirely released by the foot it does not immediately come back into full clutch engagement, but is restrained to slow action by an hydraulic dashpot connected to the clutch pedal mechanism. The dashpot permits only a deliberate and easy engagement, and is calculated to save the

AUTOCAR CLUTCH RETARDER

machine many an abrupt and racking shock. As a further measure against drivers' indiscretions, the motor is equipped with a governor which limits the speed to 18 miles per hour. The governor is actuated by the water pressure in the circulation system and is wired and sealed with a lead seal so that it cannot be tampered with by the driver or anyone else without disclosing the fact.

The Autocar commercial chassis is, in fact, marked by a number of "kinks" which prove how thoroughly the commercial question has been given thought by its designers. The front end of the frame beyond the body is rounded to serve as a buffer. The motor is concealed under the driver's seat, and the latter is fitted with a crank at the side by which it is easily raised. The turning of the crank lifts the seat high in the air, where it is securely supported until the motion of the crank is reversed. With the seat raised the motor is very accessible. It is of the two cylinder double opposed type, as in the past, but shows several detail improvements in the disposal of its fittings. The magneto and the lubricator are mounted on the top of the crank case and are driven from one shaft. The spark is fixed. In the change gear, which is of the progressive type, there are three speeds forward and a reverse. Full elliptic springs

are used all around and the rear springs have the upper leaf of the lower half and the bottom leaf of the top half sharply arched out toward each other for emergency bumpers when heavy compression takes place.

In addition to the display chassis for revealing the construction, the Autocar stand also contains the same style chassis fitted with caged express wagon, ambulance, covered delivery and rack side bodies, respectively. Solid tires are the form of equipment shown.

Although it is the same chassis that was exhibited by the Alden Sampson Mfg. Co., of Pittsfield, Mass., last year, the big five ton Sampson truck gathers inquiring groups and gratifies the technical eye by the thoroughness and detail with which it has been worked out in every respect, from spring suspension to power plant, which latter comprises a four cylinder motor. An example of this thoroughness is afforded by the differential lock which is provided as a means to prevent drive wheel spin when the truck is stuck in mud or snow.

The Pope Mfg. Co., of Hartford, Conn., is represented in the commercial section by a screamingly erubescient fire wagon on a standard Pope-Hartford chassis. The machine is laden with chemical tanks, ladders, hose, ropes, lanterns, and similar emergency paraphernalia, and in addition to the two front seats there is standing room provision for a number of firemen at the rear, so that the wagon is a ready "first aid" for conflagrations.

Two water cooled trucks, each of 4,000 pounds capacity and rated at 40 horsepower, are shown by the Knox Automobile Co., of Springfield, Mass. The model R-5 has a covered rack body, and a wheel base of 103 inches, while the model R-14 has a caged body, and a wheel base of 125 inches. In each case the four cylinder motor, rated at 40 horsepower, has cylinder 5x4¾ inches. Solid tires are fitted, 34x4 in front and 34x5 in the rear, and the final drive is by side chains.

A three ton truck is staged by the Packard Motor Car Co., of Detroit, Mich., equipped with a caged body. A four cylinder motor is used, and the engineering features of the chassis are along conventional and approved lines.

## Summary of the Cars Exhibited and of Their Features

### GASOLINE PLEASURE CARS.

American Locomotive Co., Automobile Dept., Providence, R. I., and New York City—Alco gasoline cars. One 6 cylinder 60 h.p. chain drive racing car; one each 6 cylinder 60 h.p. shaft drive limousine; chassis and touring car; one 4 cylinder 40 h.p. shaft drive toy tonneau. New features: Shaft instead of chain drive, Bosch dual ignition system. Distinctive

feature: Solid single forged rear axle construction.

Apperson Bros. Automobile Co., Kokomo, Ind.—Apperson 4 cylinder gasoline water cooled cars. One 50 h.p. Jack Rabbit, one 40 h.p. touring car, one 30 h.p. touring car and one 50 h.p. touring car. New features: New differential, semi-floating axle, 4 speed transmission in 50 h.p. machines, drop frame, raybestos brakes.

Autocar Co., The, Ardmore, Pa.—Autocar shaft drive gasoline cars. One each 4 cylinder 26-30 h.p. runabout, small tonneau and chassis. One each 2 cylinder horizontal 18-20 h.p. town car and bus. No changes deemed desirable.

Buick Motor Co., Flint, Mich.—Buick 4 cylinder shaft drive cars. Three each 30 h.p. limousine and touring car, and one chassis; two 24 h.p. tourabouts (new

cars); one 18 h.p. runabout. New features on 30 h.p.: Larger radiator, redesigned heavier transmission, improved steering gear.

**Cadillac Motor Car Co., Detroit, Mich.**—Cadillac 4 cylinder 30 h.p. water cooled shaft drive gasoline cars. One enclosed drive coupe, one limousine, one demitonneau, one touring car, one runabout and one chassis. New features: Larger wheels and tires, longer base, larger power plant, roomier body, I-beam front axle, Timken roller bearings in rear axle.

**Chalmers-Detroit Motor Co., Detroit, Mich.**—Chalmers-Detroit 4 cylinder water cooled shaft drive gasoline cars. One 30 h.p. top tonneau, one 30 h.p. runabout, one 30 h.p. chassis, one 30 h.p. runabout, one 30 h.p. touring car, one 40 h.p. touring car, one 40 h.p. pony tonneau. New features: Larger power plant, general refinement, longer wheel base and larger wheels.

**Columbia Motor Car Co., Hartford, Conn.**—Columbia 4 cylinder shaft drive gasoline cars. One each 32 h.p. chassis, limousine and touring, and two torpedoes. New features: Double ignition with Seeley jump spark system, larger engine, sliding accelerator pedal, larger clutch, new propeller shaft and universal joints, valves enclosed, water jacketed carburetter, adjustable pedals, new style radiator and mounting, heavier steering column with new design knuckles and steering rods.

**Corbin Motor Vehicle Corporation, New Britain, Conn.**—Corbin 4 cylinder shaft drive gasoline cars. One each 30 h.p. chassis, roadster, limousine, touring car and toy tonneau. New features: Longer wheel base,  $\frac{3}{4}$  elliptic rear springs, with upswept frame, cam gears housed, new oil pump, right to left throw accelerator pedal.

**Elmore Mfg. Co., Clyde, Ohio.**—Elmore 4 cylinder, 2-cycle shaft drive gasoline cars. One 36 h.p. toy tonneau, one 36 h.p. touring car, one 36 h.p. chassis and two 46 h.p. touring cars. New features: Semi-floating rear axle, longer wheel base on 36 h.p., larger wheels, upswept frame rear, three-quarter elliptic rear springs, tubular radiator, new carburetter, under pan extended in front of radiator to protect it from mud splashing, new propeller shaft and universal joints, larger brakes, and thermo-syphon circulation. 46 h.p. new model.

**E-M-F. Co., The, Detroit, Mich.**—E-M-F and Flanders 4 cylinder shaft drive cars. E-M-F.: One each 30 h.p. touring car and chassis. Flanders: One each 20 h.p. chassis, tourabout and runabout. E-M-F. new features: Cone clutch, longer wheel base, new front axle and heavier front springs. Flanders (new car) features: Block engine, multiple disc clutch, transmission on rear axle, full elliptic rear springs, operating levers inside frame, pressed steel dash, steering gear on forward engine leg with transverse reach rod to left knuckle.

**Franklin Co., H. H., Syracuse, N. Y.**—Franklin air-cooled shaft drive gasoline cars. One 4 cylinder 28 h.p. chassis, one 4 cylinder 18 h.p. runabout (new model), one 6 cylinder 42 h.p. touring car and one 6 cylinder 42 h.p. torpedo. New feature: Suction pump cooling system.

**Haynes Automobile Co., Kokomo, Ind.**—Haynes 4 cylinder 30-35 h.p. water cooled shaft drive gasoline cars. One chassis, two touring cars, one runabout and one top tonneau (all new models). Features: Cylinders cast in pairs, extra large water jackets; semi-elliptic front and three-quarter elliptic rear springs, selective type

WHERE THE E-M-F. AND FLANDERS CARS ARE SHOWN

transmission, three speeds forward and one reverse, interchangeable inlet and exhaust valves, Splittorf magneto dual ignition, splash and force feed oiler located in bottom half of crank case, two separate systems of brakes, I-beam single piece drop forge front axle and full floating rear axle, Timken roller bearings throughout.

**Hudson Motor Car Co., Detroit, Mich.**—Hudson 4 cylinder 24 h.p. shaft drive gasoline cars. One chassis, two touring cars (new models) and one roadster. Features: Semi-elliptic front and three-quarter elliptic rear springs, Bosch high tension magneto, selective sliding gear transmission, three speeds forward and one reverse, centrifugal pump cooling, internal and external brakes on rear wheel hubs.

**Knox Automobile Co., Springfield, Mass.**—Knox shaft drive gasoline cars. One 6 cylinder 60 h.p. touring car (new car), one each 4 cylinder 40 h.p. torpedo, tour-

about, touring car, tonneauette and chassis. Changes on 40 h.p.: Larger engine, upswept rear frame,  $\frac{3}{4}$  scroll elliptic rear springs, larger wheels, I-beam front axle, transmission smaller and more compact, heavier frame, new screw and nut steering gear, transmission case demountable independently of engine, also retaining unit power plant construction, new brake equalizers, new fan driven by chain belt, spring safety ratchet drive on oil and water pump shafts, simplification of oiling system, front frame cross member reinforcement.

**Locomobile Company of America, Bridgeport, Conn.**—Locomobile 4 cylinder gasoline cars. One each 30 h.p. shaft drive chassis, touring car, limousine and toy tonneau; one 40 h.p. chain drive runabout. New features: Larger brakes on 30 h.p. Distinctive feature: Make and break ignition.

**Lozier Motor Co., New York City**—Lozier gasoline cars. One each 6 cylinder 50

POPE-HARTFORD CARS EFFECTIVELY DISPLAYED

LOCOMOBILE 40 HORSEPOWER ROADSTER

LOCOMOBILE 30 HORSEPOWER LANDAULET

h.p. shaft drive chassis and Briarcliff roadster; one each 4 cylinder 45 h.p. chain drive limousine and touring car. New features: Square tube radiator, more silent transmission and demountable rims. Distinctive feature: Unit power plant.

Matheson Motor Car Co., Wilkes-Barre, Pa.—Matheson gasoline cars. One each 6 cylinder 50 h.p. shaft drive chassis, touring car and toy tonneau; one each 4 cylinder 50 h.p. chain drive chassis and limousine. Changes not deemed necessary. Distinctive features of 6 cylinder cars: Motor base cast to form dust pan, rear axle transmission. Features of 4 cylinder car: Make and break ignition and overhead valves, all operated from outside cam shaft mounted on upper left side of cylinders.

Mercer Automobile Co., Trenton, N. J.—Mercer 4 cylinder 30 h.p. water cooled gasoline cars. One chassis, one limousine, one toy tonneau and one touring car. Features: Cylinders cast in pairs, three speed selective transmission, multiple disc clutch, three-quarters elliptic springs in the rear, double Spicer universal joint drive system with torsion and radius rods, centrifugal pump with protected tubular radiator, equalized brakes, radiator mounted on frame by trunnion.

Metzger Motor Car Co., Detroit, Mich.—Everitt 4 cylinder shaft drive gasoline cars. One 30 h.p. chassis, one 30 h.p. touring car. First time shown in New York City. Features: Block motor, double drop frame, selective transmission integral with rear axle, cylinders and upper half of crank case integral.

Olds Motor Works, Lansing, Mich.—Oldsmobile water cooled shaft drive gasoline cars. One 6 cylinder 60 h.p. chassis, one 6 cylinder 7 passenger touring car, one 6 cylinder 60 h.p. runabout, two 4 cylinder 40 h.p. touring cars, one 4 cylinder 40 h.p. close coupled, one 4 cylinder 40 h.p. 7 passenger touring car. New features: Changes on 4 cylinder models. Longer wheel base, larger wheels, 4 speed selective transmission instead of 3 speed, three-quarter elliptic springs in rear, new Bosch dual ignition system, combination oil and electric lamps. New feature on 6 cylinder cars: 42 inch wheels on all models except limousine. Other changes same as on 4 cylinder cars.

Packard Motor Car Co., Detroit, Mich.—Packard 4 cylinder shaft drive water cooled cars. One 30 h.p. limousine, one 30 h.p. Florodora limousine, one 30 h.p. phaeton, and one 18 h.p. landaulet. New features: Packard dry plate clutch, enclosed front for driver on Florodora limousine.

Palmer & Singer Mfg. Co., New York City

—P-S shaft drive gasoline cars. One 6 cylinder 60 h.p. dreadnought, one 6 cylinder 60 h.p. touring car, one 4 cylinder 30 h.p. chassis and one 4 cylinder 30 h.p. runabout. New features: Clutch in fly wheel and elimination of torsion rods.

Peerless Motor Car Co., Cleveland, Ohio—Peerless shaft drive gasoline cars. One 6 cylinder 50 h.p. touring car, one 4 cylinder 30 h.p. limousine, one 4 cylinder 30 h.p. chassis, one 4 cylinder 20 h.p. town car. New features: Town car new model, with valves on left side, and left hand steering, with levers in center. Double ignition, new carburetter, larger springs, larger steering wheel, new universal and rear axle housing of pressed steel.

Pierce-Arrow Motor Car Co., Buffalo, N.

Y.—Pierce-Arrow 6 cylinder water cooled shaft drive gasoline cars. One 48 h.p. chassis, one 36 h.p. runabout, one 48 h.p. touring car, one 36 h.p. brougham, one 66 h.p. landaulet. New features: Increased bore on 36 and 66 h.p. models, three-quarter elliptic springs on larger models, larger wheels and tires, mechanical pump for inflation of tires, combination electric and kerosene side and tail lamps.

Pope Mfg. Co., Hartford, Conn.—Pope-Hartford 4 cylinder shaft drive gasoline cars. One each 40 h.p. roadster, pony tonneau, landaulet, and two touring cars. New features: Larger wheels, new oiling system, rear axle strengthened, longer rear springs, steering reach rod placed above axle.

Royal Tourist Motor Car Co., Cleveland, Ohio—Royal Tourist 45 h.p. cylinder shaft drive cars. One dust proof, one touring car, one chassis, one close coupled and one limousine. New features: Four internal brakes on rear wheels with differential equalizers, one piece tubing in rear axle.

Selden Motor Vehicle Co., Rochester, N. Y.

—Selden 36 h.p. 4 cylinder shaft drive gasoline cars. One torpedo (new model), one limousine, one 5 passenger touring car, one 7 passenger touring car, one roadster and one chassis. New features: Larger power plant, 122 inch wheel base on 7 passenger car, Fedders square tube radiator, disappearing clutch pedal with adjustable foot pads, removable coil units, increased clutch leverage, frame lowered slightly, new carburetter, Brown-Lipe gears, positive brake equalizers carried inside frame, front and side fenders continuous, new axle, gas tank mounted on chassis.

Simplex Automobile Co., New York City—Simplex 4 cylinder chain drive gasoline cars. One each 50-70 h.p. chassis and limousine. No changes deemed desirable.

Stearns Co., The B. F., Cleveland, Ohio—Stearns 4 cylinder shaft drive gasoline cars. One each 15-30 h.p. limousine, touring car and toy tonneau; one each 30-60 h.p. toy tonneau, chassis and touring car. New features: On 30-60 h.p., dry plate clutch and Bosch dual ignition. Distinctive features: Solid single forged rear axle and demountable rims on all cars. Block engine on 15-30 h.p.

Stevens-Duryea Co., Chicopee Falls, Mass.—Stevens-Duryea shaft drive gasoline cars. One 6 cylinder 35 h.p. chassis, one 4 cylinder 24 h.p. limousine, one 6 cylinder 35 h.p. touring car, one 6 cylinder 40 h.p. touring car, one 4 cylinder 24 h.p. gentleman's roadster, and one 4 cylinder 24 h.p. passenger touring car. 6 cylinder 35 h.p. and 4 cylinder 24 h.p. cars new models. New features: Unit power plant on three point suspension, withdrawal of pistons without removing cylinders or breaking water connections, interchangeable intake and exhaust valves, independent ignition systems, full floating rear axle unit housing.

Studebaker Automobile Co., South Bend, Ind.—Studebaker-Garford 4 cylinder shaft drive gasoline cars. Two 40 h.p. roadsters, one chassis and one limousine. New features: Transmission redesigned, new type radiator, frame curved over rear axle. Distinctive feature: Make and break ignition.

Thomas Motor Co., E. R., Buffalo, N. Y.—Thomas water cooled gasoline cars. One 6 cylinder 70 h.p. double chain drive limousine, one 4 cylinder 28 h.p. shaft drive landaulet (new model), one 6 cylinder 40 h.p. shaft drive touring car (new model), one 6 cylinder 70 h.p. chain drive flyabout, one 6 cylinder 40 h.p. shaft drive chassis, one 6 cylinder 70 h.p. chain drive touring car. New features: Electric lighting on 70 h.p., 38 inch wheels, cast aluminum fan with new housing, Thomas radiators.

White Co., The, Cleveland, O.—White steam and gasoline cars. One 40 h.p. 7 passenger steam touring car, one 20 h.p. chassis, one torpedo and one landaulet. New features of steam car: Kerosene burner. Features of gasoline car shown for first time: Water cooled engine cast in block, mechanically operated and interchangeable valves, selective type transmission, four forward speeds and one reverse, shaft drive, two brakes on each rear wheel, I-beam front and chrome nickel steel rear axle.

Willys-Overland Co., Toledo, Ohio—Overland and Marion 4 cylinder shaft drive gasoline cars. One 40 h.p. touring car, two 40 h.p. runabout, one 40 h.p. town car, one 30 h.p. toy tonneau and one 30

h.p. runabout. New features: Larger valves, main shaft through torsion rod, multiple disc instead of cone clutch, cylinders cast separately on Overland and in pairs on Marion.

Winton Motor Carriage Co., Cleveland, O.—Winton 6 cylinder 48 h.p. water cooled shaft drive cars. One chassis, one limousine, one torpedo, one torpedo touring car, one 5 passenger touring car and one toy tonneau. New features: 4 speed transmission, flat springs, upswept rear frame, channel section pressed steel front axle, larger multiple disc clutch.

### ELECTRIC PLEASURE CARS.

Anderson Carriage Co., Detroit, Mich.—Detroit electric pleasure cars. One victoria, one 4 passenger brougham, one 2 passenger coupe (new model), and one roadster. New features: Countershaft brake, longer wheel base and 24 cell batteries.

Babcock Electric Carriage Co., Buffalo, N. Y.—Babcock electric pleasure cars. One 7 passenger town car (new model), one 2 passenger victoria, one 4 passenger coupe, inside drive (new model). Features: Guaranteeing batteries 6,000 miles, and 100 miles on single charge. Automatic power cut-off and brake, switch lock to prevent tampering, tilting steering pillar.

Bailey & Co., S. R., Amesbury, Mass.—Bailey electric pleasure cars. Two victoria phaetons. New features: Edison batteries, pneumatic tires. Distinctive features: 34 inch wheels, cold rolled steel side frame, 3 point suspension for batteries giving better accessibility.

Baker Motor Vehicle Co., Cleveland, O.—Baker electric pleasure cars. One extension bevel gear shaft drive extension coupe, one bevel gear shaft drive Queen Victoria, one bevel gear shaft drive runabout, one bevel gear shaft drive straight front coupe, one bevel gear shaft drive runabout coupe. Features: Semi-floating rear axle, semi-elliptic front and full elliptic rear springs, continuous torque controller, wheel steer on runabout and runabout coupe, internal expanding brakes on rear wheels, and emergency band brake on motor, wheel base increased to 80 inches, larger and roomier bodies.

Columbia Motor Car Co., Hartford, Conn.—Columbia electric pleasure cars. One victoria and one 5 passenger bus.

Rauch & Lang Carriage Co., The, Cleveland, Ohio—R. & L. electric pleasure cars. Two runabouts, one victoria, one extension coupe, and one 40 cell inside drive 4 passenger landaulet (new model). New features: Longer wheel base and square front changed to rounding front.

Studebaker Automobile Co., South Bend, Ind.—Studebaker electric pleasure cars. One victoria phaeton, one coupe, one lan-

daulet. New features: Continuous torque controller, floating rear axle, smaller battery construction, internal expanding brakes.

Waverley Co., The, Indianapolis, Ind.—Waverley electric pleasure cars. One 4 passenger brougham, one 2 passenger brougham, one 2 passenger victoria, one stanhope and one roadster, built upon lines of gasoline car. New features: Enclosed drive on all cars optional with purchaser, 96 inches wheel base, full elliptic springs throughout, irreversible wheel steer, single forged I-beam front axle.

Woods Motor Vehicle Co., Chicago, Ill.—Woods electric pleasure cars. Two 5-passenger broughams, one 4 passenger brougham and one 2 passenger victoria. New features: 5 passenger broughams new models, large battery equipment, car designed to run on solid tires.

### GAS AND ELECTRIC COMMERCIALS.

Autocar Co., The, Ardmore, Pa.—Autocar 2 cylinder horizontal opposed 18 horsepower shaft drive gasoline commercial vehicles. One chassis, one ambulance, three delivery wagons, one 12-passenger station bus, one taxicab, one express wagon. New features: Increased carrying capacity, larger wheels and tires, full floating rear axle with cast steel housing, double reduction gearing, double acting brakes, Timken bearings throughout, Bosch single ignition with fixed sparking point, taking control of spark away from operator; adjustable fixed speed lever; clutch retarder to make clutch engage slowly.

Baker Motor Vehicle Co., Cleveland, Ohio—Baker electric commercial vehicles. One 1-ton chassis and one ½-ton chassis. Features: Continuous torque controller, double chain drive.

Franklin Mfg. Co., The H. H., Syracuse, N. Y.—Franklin 4 cylinder air cooled gasoline commercial cars. One 4 cylinder truck, 2,000 pounds truck, one fire chief's car (new model) and one taxicab. New features: New air cooling system.

General Vehicle Co., New York City—General electric commercial vehicles. One 5-ton brewery truck, one 2-ton chassis, one 1,000 pounds wagon. Distinctive features: Double chain drive, single motor drive, lead batteries, three-quarter rear elliptic springs.

Hewitt Motor Co., The, New York City—Hewitt gasoline trucks. One 4 cylinder 36 h.p. 5-ton truck, one 4 cylinder 36 h.p. 2-ton truck, one 2 cylinder horizontal opposed 20 h.p. 2-ton chassis. New features: Governor control, limiting speed to 10 miles per hour. Distinctive features: Accessibility of parts, pistons being removable without dismantling engine, planetary transmission with single pedal control, semi-elliptic springs throughout, thermo-syphon cooling.

Knox Automobile Co., Springfield, Mass.—Knox 4 cylinder 40 h.p. chain drive gasoline commercial vehicles. Two 2-ton trucks. New features: Pneumatic tires for high speed work, geared to 25 miles per hour, shorter wheel base. Distinctive features: Accessibility of entire power plant, pneumatic tires, single front and dual rear, 34x4½, Fisk quick demountable rims, drop forged I-beam front axle, selective type sliding gears, Bosch dual high tension magneto system, also with batteries and commutator.

Packard Motor Car Co., Detroit, Mich.—Packard 4 cylinder gasoline commercial vehicles. One 3 ton double chain drive truck. Distinctive features: Accessibility of power plant, Packard type transmission, practice of putting rear wheels well forward to provide easier steering and better traction, semi-elliptic springs throughout, automatic governor control limiting speed to 12 miles an hour.

Pope Mfg. Co., Hartford, Conn.—Pope-Hartford 4 cylinder shaft drive gasoline commercial cars. One 4 cylinder 40 h.p. combination chemical and hose wagon. New features: Longer wheel base and stronger reinforced chassis, larger wheels, more power, longer body to permit of use of longer ladders. Features: Three-speed selective type transmission, chrome nickel steel gears, new design leather-faced clutch coupling, mechanical oiler located in crank case, mechanically operated valves in cylinder head.

Sampson Mfg. Co., Alden, Pittsfield, Mass.—Sampson gasoline commercial vehicles. One 4 cylinder water cooled 5-ton 40 h.p. chain drive chassis. New features: Dual rear tires, 42x6 inches, pressed steel frame, thermo-syphon cooling, 4 speed selective sliding gear transmission.

Studebaker Automobile Co., South Bend, Ind.—Studebaker electric commercial cars. One 850 pounds light delivery wagon, one 1,500-2,000 pounds chassis, one 1,500-2,000 pounds delivery wagon, one 2-ton stake truck. New features: 42 inch wheels, more clearance, railroad type of oiler instead of grease cup on rear axle, Westinghouse continuous control, semi-elliptic springs throughout. Exclusive feature: Batteries spring suspended.

Thomas Motor Co., E. R., Buffalo, N. Y.—Thomas 4 cylinder taxicabs. One cab and one chassis. New features: Transmission removed from rear axle, increased strength, dash radiator and sloping hood, self contained oil tank, left hand drive, clutch run in oil, heavier frame, longer wheel base, fixed spark, foot throttle control, clutch and brake control by single pedal, larger tires with demountable rims, three-quarter elliptic rear and semi-elliptic front springs, thermo-syphon cooling, drop frame, wider springs, Spicer universal joint full floating type rear axle, wheels driven independently of hub cap.

## Tires and Accessories Not Seen at "the Other Show"

In addition to all of the well-known tires which were exhibited at the Palace, the Garden discloses several new ones, among them the Federal cross-country tire which, although not entirely new to the trade, never before has been publicly displayed. This tire is distinguished by a non-skid tread formed of maltese crosses and is claimed to be the tire par excellence for

winter use or rough roads. It is cured in an airbag in open heat and is not subjected to the heat from an air core. The Federal people also show their better known wrapped tread tire.

The Thermoid, Carpringco and Imperial are the three really new tires that are making their first appearances. The Thermoid is the product of the Thermoid Rubber Co.,

of Trenton, N. J., who already are well-known because of the Thermoid brake lining, which, of course, is exhibited in connection with the new tire. The latter is of the flat tread type, with an unusually heavy tread, in which is vulcanized a wear-resisting fibre so compounded with the rubber that the end of each fibre extends to the surface of the tire; the resulting durability

THE APPROACH TO THE ELEVATED PLATFORM AND ACCESSORY EXHIBITS

is claimed to be good for 10,000 miles of service.

The Carpringco tire is the product of the New Jersey Car Spring Co., of Jersey City, N. J., and is an attractive looking article of standard design. Extra quality, due to the fact that the tires are made by hand and that the output is limited, is the chief claim made for the production.

The third new tire, the Imperial, is made by the McGraw Tire & Rubber Co., of Pittsburg, Pa. It is made in three forms, one with a fabric tread which, in addition to the usual layers of fabric, has several similar layers embedded in the tread proper, resembling somewhat the Thermoid in this respect, save that in the latter the fabric is laid vertically while in the Imperial the fabric is embedded horizontally. The other two Imperial tires are of the conventional clincher type, one with a heavy, flat tread and the other with a crowned tread.

A stitched tire, the Bragg, in which the rubber and fabric are held together by 12,000 stitches, in addition to the vulcanizing, is exhibited by the Seamless Rubber Co., of New Haven, Conn.

The Stein lap-lock tire, the product of the Stein Double Cushion Tire Co., Akron, Ohio, is a comparatively recent addition to the united tire family, the feature of which is a heavy base which completely fills

the rim and which is divided diagonally instead of horizontally, as in the conventional tire. It is from the overlapping of this diagonal cut that the tire takes its name.

The Motz Clincher Tire Co., of Akron, Ohio, displays its cushion and solid tires, and the Continental Rubber Works Co., of Erie, Pa., a full line of inner tubes, repair sleeves, etc. Post & Lester Co., Hartford, Conn., also exhibit inner repair sleeves of a similar kind.

No show being complete without something of the sort, the "completeness" of the tire display at the Garden show is evidenced by the crowds surrounding the valveless inner tube which is shown by a New York Wall Street company bearing that title. The crowd gapes with open-mouthed wonder as the demonstrator repeatedly jabs a needle-like syringe into the tube and inflates it by the same means. The tube itself is unusually heavy and is reinforced by an inner wall of sealing rubber which, of course, is claimed to make punctures self-healing. Pumping up the tire, as stated, is performed by plunging the inflating needle through the casing and the inner tube, the needle being attached to an ordinary pump.

Several improved ignition devices that were not exhibited at the Palace Show in-

dicate that the possibilities of spark-plug and magneto are not yet exhausted. One of the latter, a high-tension magneto which rocks in a horizontal position upon its own axis in order to advance and retard the ignition, is the offering of the Mea Company, of Stuttgart, Germany, of which Theo. H. Marburg is the New York representative. The object of rotating the whole magneto is, of course, to break the current at the "peak of the wave"; a very hot spark results, even in the most extreme retard position. The whole magneto is mounted horizontally, the contact breaker is placed outside and consists of two platinum screws, of which one is attached to a U-shaped spring, which is raised twice in every revolution by means of roller and stud ring, and the other fixed to a disc.

Another high tension magneto that has not been exhibited before, is the K-W, manufactured by the K-W Ignition Co., of Cleveland, Ohio. It is an adaptation to the low-tension type of an addition of the secondary winding for high tension work. A switch starter designed to eliminate "cranking" as long as there is an explosive mixture in any cylinder, is shown by the Simms Magneto Co., of New York, as a new feature of its product. It comprises a metal switch for mounting on the dashboard, a special contact breaker in the magneto

and an ordinary dry battery.

Reliance and J-D spark plugs of improved design are displayed by the Jeffery-Dewitt Co., of Newark, N. J., while the Champion Ignition Co., of Flint, Mich., presents a spark plug with quick detachable terminal in place of the regular nut end, and a brass washer shaped conically to fit the porcelain, to keep oil out. R. E. Hardy Co., of New York, are showing a new plug which they call "Apropos," and which was brought out during the week. Its central electrode is flush with the porcelain and quite free from it, so that the capillary attraction of the porcelain tends to draw the oil away from the electrode and thus prevent fouling.

The trend towards electric lighting of gasoline cars is made even more pronounced by the exhibits at the Garden. Storage and dry batteries are shown illuminating from four to five Tungsten lamps at the booth of the Philadelphia Storage Battery Co., while the Willard Storage Battery Co., of Cleveland, Ohio, displays a circuit of head and tail lights operated by an "Elba" storage battery. The generator shown by this company, and which is intended to supply the necessary electric current when the car is in motion, is a miniature copy of the approved type used in train lighting.

The city ordinances prohibiting the use of searchlights are responsible for several new models of "headlights," which can be rendered dim or light instantly. C. Cowles & Co., New Haven, Conn., offer a lamp in which the electric bulb may be pushed forward out of the focus of the reflector—by the mere pressure of a finger; a half turn of the knob, by which a pin engages a slot, holds the lamp socket securely in either the bright or dim position. Another style of lamp in which two electric bulbs are stationary, one of 8-candle power in the focus of the reflector and another of 3-candle power at the lower rim of the lamp, is shown by the Apple Electric Co., of Dayton, Ohio. The same company calls attention to an improvement in their complete electric lighting system, consisting of a "load regulator," which holds the current generated by the dynamo to that fixed upon, thus making possible driving from variable speed engines. This regulator connects the dynamo circuit through a voltmeter to a storage battery as soon as a certain voltage is reached, and supplies the lights with current from the storage battery when the dynamo is at rest or running at slow speed.

An electric indicator to be affixed to the rear of the car, showing the words "Right," "Left," "Stop" in red light, as soon as a corresponding button is pushed by the operator, is exhibited by C. Cowles & Co., New Haven, Conn., who also show a novel foot rest and heater combined, shaped not unlike a gridiron, which may be heated by hot water from the radiator or hot air from the exhaust pipe.

Locking the magneto or spark-coil switch by means of a combination lock is suggested by the Whalen Lock Co. (B. M. Asch, New York distributor), as a sure means of safeguarding a car from would-be joy-riders or thieves. The lock is an adaptation of the well-known tumbler lock used on safes, and permits of 729 different combinations.

Minor improvements in windshields are numerous, some of those not previously seen being disclosed by the Cox Brass Mfg. Co., who have a friction band device for the raising, lowering and holding in position of the upper half of the shield; a pressure of thumb or finger upon a plunger releases the braking bands and permits of the moving of the shield; no screws, bolts or nuts are used. The Novelty Mfg. Co. exhibits a shield, both glasses of which can be adjusted to any desired position.

That windshields need not necessarily consist of glass throughout, but that the lower part can be made of any waterproof, opaque material, such as mohair, leather, rubber cloth, "pantasote," etc., is demonstrated by the Vanguard Mfg. Co., of Joliet, Ill. This company exhibits a "Zig-Zag" shield, constructed out of seamless tubing. The lower part is inclined at an angle of about 50 degrees, while the upper part is of the regular brass and glass construction, and adjustable to any desired position. In fair weather, when an abundance of fresh air is welcome, the curtain covering the lower part can be rolled up. The fastenings of the frame present no novelty, being fitted with a simple nut for tightening and producing sufficient friction for holding the shield in position.

The Springfield Metal Body Co., Springfield, Mass., stages a 7-passenger black limousine, aluminum body upholstered in grey, constructed along standard lines and presenting a stylish and luxurious product. The novelty of the exhibit, however, is a topedo body, also in black, which besides offering the usual features of this type of car, provides for example, baggage room on a rear platform, by close-coupling the tonneau. It is the only close-coupled "gunboat" body shown at the Garden.

Making its show debut, the Parker motor, manufactured by the Parker Motor Co., of Hartford, Conn., is disclosed in the space of the McCue Company, also of Hartford. It is four cylinder, four cycle, watercooled, and is rated at 32.4 on the A. L. A. M. rating, being  $4\frac{1}{2} \times 5$ . The cylinders are cast in pairs, offset one inch. Complete waterjacketing of the head has been effected, the valves all being on one side. Without disturbing the crank shaft or taking off the cylinders the pistons and connecting rods can readily be removed. All the various considerations of lubrication, circulation, ignition, manifolds, valve action and the like have been provided for in a wholly adequate way and a free use has been made of special metals at the points where their respective virtues make suitable their use. McCue parts, fittings and the recently improved

rear axle form the setting in which the motor appears.

An amplification of the rebound check spring is shown by the H. & F. Mesinger Mfg. Co., of New York, whose new double spring consists of two heavy springs joined by a strong leather strap in which the axle rests, and fitted with clamps which can be attached to any steel frame without drilling of holes; they show their single check spring also. The same exhibit includes several patent leather novelties, among them a rather neat magneto cover.

A noteworthy improvement in ball bearings is shown by the New Departure Mfg. Co., of Bristol, Conn. It consists of a separator of phosphor bronze with deep sockets for each ball, designed in such a way that the oil is retained at the diametrical centre of the ball at right angles to the axis of rotation. The separator is in two halves, each of which is identical with the other; each row of balls runs in a half of the separator and is independent of the other row of balls. The company exhibits also another form of separator for a single row of balls, in which the two sections are riveted together face to face instead of back to back.

A wrench of unique construction is exhibited by the Perfection Wrench Co., of Port Chester, N. Y. It combines a vise clamp, jack and tool holder, and pipe wrench.

That a tire trunk can be used for other purposes than simply storing spare tires is decisively demonstrated by the Nathan Novelty Mfg. Co., of New York City, who show a trunk constructed of hard wood covered with leatherette and bound with leather, fitted with a removable cover which carries three folding legs. When these legs are unfolded the whole contrivance forms a very handy table for tourists' use. A full line of leather, enameled duck and rubber cloth goods for the use of motorists forms the rest of this company's offerings.

Radiators of extreme lightness for automobile and aeronautical use are shown by the A-Z Company, of New York. Among the most striking examples is one for 60 horsepower engines, weighing 23.5 lbs., and one for engines of 40 horsepower, weighing 18.5 lbs.

#### SUMMARY ACCESSORY EXHIBITS.

##### Elevated Platform.

Ajax-Grieb Rubber Co., Trenton, N. J. (120)—Ajax tires.

American Ball Bearing Co., Cleveland, O. (155)—Ball bearings.

American Ever Ready Co., New York City (126)—Ever Ready batteries, lamps and tire specialties.

Atwater-Kent Mfg. Works, Philadelphia, Pa. (104)—Igniters and timers.

Atwood-Castle Co., Amesbury, Mass. (168)—Lamps.

Auburn Auto-Pump Co., Auburn, N. Y. (137)—Ten Eyck tire pump.

Auto Improvement Co., New York City (127)—Self-starting devices and motor specialties.

Badger Brass Mfg. Co., Kenosha, Wis., and New York City (157)—Solar lamps and acetylene generators.

Baldwin Chain & Mfg. Co., Worcester, Mass. (110)—Baldwin chains and recoil check.

Bowser & Co., S. F., Ft. Wayne, Ind. (170)—Tanks, measuring pumps and gasoline storage systems.

Briscoe Mfg. Co., Detroit, Mich. (165)—Radiators and fittings.

Brown-Lipe Gear Co., Syracuse, N. Y. (152)—Transmission, differential and steering gears.

Byrne-Kingston & Co., Kokomo, Ind. (148)—Kingston carburettors, mufflers and pumps.

Coes Wrench Co., Worcester, Mass. (131)—Wrenches.

Connecticut Telephone & Electric Co.,

Mass. (178)—Fisk tires, quick detachable and demountable rims.

Fox Metallic Tire Belt Co., Brooklyn, N. Y. (134 A)—Non-skid chains.

G & J Tire Co., Indianapolis, Ind. (105)—G & J tires.

Gabriel Horn Mfg. Co., Cleveland, O. (159)—Gabriel exhaust horns and shock absorbers.

Gilbert Mfg. Co., The, New Haven, Conn. (166)—Tires, jackets, lamp covers and rubber cloth specialties.

Globe Machine and Stamping Co., The, Cleveland, O. (129)—Metal stamping specialties.

Goodrich Co., B. F., The, Akron, O. (100)—Goodrich clincher tires.

Manufacturers' Foundry Co., Watertbury, Conn. (137-A)—Castings.

Mezger, C. A., New York City (115)—"Sootproof" spark plugs and automatic windshields.

Michelin Tire Co., Miltown, N. J. (172)—Michelin tires.

Morgan & Wright, Detroit, Mich. (180)—Morgan and Wright tires.

Mosler, A. R., New York City (158)—Spark plugs, timers and rear signal devices.

Motsinger Device Mfg. Co., Pendleton, Ind. (146)—Ignition systems.

Motz Clincher Tire and Rubber Co., The, New York City (138)—Tires.

N. Y. and N. J. Lubricant Co., New York City (117)—Lubricants.

National Carbon Co., Cleveland, O. (119)—Dry batteries.

Oliver Mfg. Co., Chicago, Ill. (142)—Peerless jacks.

Pennsylvania Rubber Co., Jeannette, Pa. (107)—Pennsylvania tires.

Pittsfield Spark Coil Co., Dalton, Mass. (150)—Ignition systems.

Randall-Faichney Co., The, Boston, Mass. (147)—Jericho exhaust horns, B-Line grease guns, Bing spark plugs.

Remy Electric Co., Anderson, Ind. (173)—Magnetos.

Republic Rubber Co., Youngstown, O. (118)—Tires.

Sager Co., J. H., Rochester, N. Y. (125)—Supplementary springs.

Spicer Universal Joint Mfg. Co., Plainfield, N. J. (149)—Universal joints.

Splittdorf, Inc., C. F., New York City (102)—Timers, distributors, coils and ignition specialties.

Standard Welding Co., The, Cleveland, O. (156)—Tubing, electrically welded parts and rims.

Stewart & Clark Mfg. Co., Chicago, Ill. (175)—Speed indicators.

Swinehart Clincher Tire and Rubber Co., Akron, O. (153)—Swinehart solid and pneumatic tires.

Timken-Detroit Axle Co., The, Detroit, Mich. (143)—Timken axles.

Timken Roller Bearing Co., Canton, O. (144)—Roller bearings.

Vacuum Oil Co., Rochester, N. Y. (167)—Lubricants.

Valentine & Co., New York City (163)—Varnishes.

Veeder Mfg. Co., Hartford, Conn. (179)—Tachometers and tachodometers.

Warner Gear Co., Muncie, Ind. (154)—Gears and parts.

Warner Instrument Co., Beloit, Wis. (145)—Warner speed indicators and clocks.

Weed Chain Tire Grip Co., New York City (116)—Non-skid tire chains.

Wheeler & Schebler, Indianapolis, Ind. (175)—Carburettors and magnetos.

Whitney Mfg. Co., The, Hartford, Conn. (151)—Whitney chains and keying systems.

Witherbee Igniter Co., Springfield, Mass. (128)—Batteries, plugs and magnetos.

#### Balcony.

Allen Auto Specialty Co., New York City (234)—Tire jackets and specialties.

Batavia Rubber Co., The, Batavia, N. Y. (207)—Tires.

Bretz Co., J. S., New York City (226)—F. & S. Imported ball bearings and U. & H. high tension magnetos.

Carpenter Steel Co., The, Reading, Pa. (231)—Parts.

Champion Ignition Co., Flint, Mich. (211)—Ignition systems.

Couch & Seeley Co., Boston, Mass. (232)—Combination tail lamp and number plate holders.

Driggs-Seabury Ordnance Corporation,

CHARLES E. MILLER'S DISPLAY OF ACCESSORIES

Meriden, Conn. (114)—Spark coils, switches and ignition specialties.

Consolidated Rubber Tire Co., New York City (174)—Tires.

Continental Caoutchouc Co., New York City (177)—Continental tires.

Continental Rubber Works, Erie, Pa. (136)—Tires.

Cook's Sons, Adam, New York City (164)—Lubricants.

Cook's Standard Tool Co., Kalamazoo, Mich. (132)—Standard jacks.

Cowles & Co., C., New Haven, Conn. (135)—Lamps, monograms and bouquet holders.

Cramp & Sons, William, Ship and Engine Building Co., Philadelphia, Pa. (109)—Bronze and bearing metal castings.

#### Russia as an Attractive Market.

Moujiks, caravan tea, furs, snow and nihilists, these constitute Russia in the mind of the average American. The latter forgets that the Russian of the wealthy, prosperous class is lavish, hospitable and generous, and, lastly, luxury loving. As a result the automobile—particularly the finest most luxurious and expensive car—is finding, or is likely to find, a readier market in Russia than anywhere else in the world. This is no mere random talk, but the gist of a report sent by American Consul-General John H. Snodgrass, of Moscow.

"There have been no automobile manufacturing, in the American meaning of the word, in Russia," he writes. "A number of bicycle and carriage manufacturers have, for some time, been importing parts of automobiles, such as the engines, tires, and the finer construction, while the body and rougher parts have been made in Russia. There are no available figures as to the number of machines that are put together in this way, but the business has not been particularly thriving, as the Russians demand the best the markets afford, and the majority refuse to purchase anything of the cheap or shoddy grades.

"The demand for automobiles and commercial vehicles is constantly growing, as the following figures taken from the customs returns show: in 1906 only 245 machines were imported; this had risen to 555 in 1907, and to 866 in 1908. For the first seven months of 1909, 628 passed through the custom house, and agents are anticipating better results in 1910.

"The larger machines are in demand and sell better than those with less than four seats. There is also a growing trade in motor freight cars and trucks for use by the municipalities and the contracting companies.

"The following statement shows the growth of the automobile trade in Russia (imports) and the classes of machines in use:

Description.	1907		1908	
	No.	Value.	No.	Value.
Four and more seats . . . . .	319	\$719,500	572	\$1,364,000
Less than four seats . . . . .	89	97,000	124	165,000
Freight and truck autos. 147		140,500	170	146,000
Total . . . . .	555	\$957,000	866	\$1,675,000

"For the first seven months of 1909, the machines of four or more seats imported numbered 461, valued at \$934,500, those with less than four seats numbered 70, worth \$71,500, and motor freight cars and trucks numbered 97, valued at \$74,000, a total of 628 cars valued at \$1,080,000."

Street pavements, even in the more pretentious cities, are of cobblestones, and extremely trying on motor cars, while the country roads are as bad or worse than similar roads in the Southern States.

Consul Snodgrass concludes his report by calling attention to the love of sport among the Russians:

"Russia presents the most lucrative territory in the world for the introduction of automobiles that are strongly built and that have modern improvements. The Russians are taking to automobiling, and many of the wealthiest families have discarded their horses, which is saying much for the motor.

"There is a vast amount of wealth in this Empire among the upper stratum of society, which is readily spent in any form of pleasure. The Russians part with their money more readily even than the Americans, especially when there is any form of sport in sight, so that it will not be a difficult problem to interest those with means when a suitable automobile is presented. At the present time the French and Italian cars are the favorites, though the Germans have been getting a large part of the trade.

"If American concerns will make arrangement with houses in Russia, or send a personal representative from home, they will do better than to trade through middlemen in Hamburg and London, who must have a handsome commission for introducing the goods. Thus by the time the automobile reaches the purchaser, the price is much greater than the European car of like value. The duty on automobiles, four and more seats, is 220 rubles (\$113.30); on machines of less than four seats, 140 rubles (\$72.10); on motor trucks and chassis for automobiles, 70 rubles (\$36.05)."

#### Precaution that Will Save Cylinders.

If, after draining the water from the cooling system during a cold spell, the motor is permitted to run for four to five minutes, the danger of cylinders cracking will be very considerably reduced. The heat generated by the continued operation will consume such moisture as may remain and remove the possibility of its freezing.

## TROPHY TURNED OVER TO THOMAS

New York-Paris Prize Formally Presented to Buffalo Manufacturer—Award Made at a Notable Banquet.

An echo of the New York to Paris race which started from this city on February 12th last, and finished in the French capital July 30th, was heard at the Automobile Club of America, New York, Saturday night last, 8th inst., when a banquet was tendered E. R. Thomas, president of the E. R. Thomas Motor Co., of Buffalo, N. Y., who entered the Thomas car that won the contest, and when the official presentation was made of the magnificent trophy that was presented jointly by the New York Times and the Paris Matin, the two newspapers that promoted the New York to Paris project.

The occasion was not less notable than the setting. The arrangement of the tables was unique, comprising a large horseshoe and a smaller guest table, which was placed opposite the opening of the horseshoe. Just inside the oval was the trophy, covered by an immense American flag. Running all the way around the horseshoe was a mission rail on which were displayed photographs of the race from start to finish, while at frequent intervals were mission uprights, on which electrically lighted transparencies also furnished views of the contest.

Thomas Moore was the toastmaster and on either side of him sat George Schuster and George Miller, who were in the Thomas car for the greater part of the journey. Mr. Thomas made a speech of acceptance and Schuster and Miller also were prevailed upon to say a few words. The menu took the form of 20-page booklets, descriptive of the contest.

The trophy is one of the largest of its kind ever made, and one of the unique features of it is that it is composed of materials native to the four nations represented in the race. It stands 6 feet 6 inches in height and weighs about 1,600 pounds. The pedestal is on green Italian marble, imbedded in which are bronze plates depicting scenes and episodes of the contest. The sub-base is of French pink marble, forming boulders, medallions of German bronze bearing the coats of arms of the four competing nations being on the four sides. A great German bronze globe of the world forms the top of the trophy. The continents are shown in bas relief, and the route is traced with American silver. Perched on the top is an American eagle, its talons gripped in that portion of the globe representing the American continent.

Six cars started in the circummundane contest from New York City, February 12, 1908—a De Dion, a Motobloc and a Sizaire-Naudin being French entrants; Italy was represented by a Zust, Germany by a Pro-

tos, and America by a Thomas. It originally was planned to run to San Francisco and ship the cars by boat to Valdez, Alaska, thence over the Fairbanks trail to Nome, again taking the boat to East Cape, Siberia, and from there overland to Paris. This route finally was abandoned after the

NEW YORK TO PARIS TROPHY

Thomas car, driven by Schuster, proved the impracticability of a trip through Alaska. The cars then were shipped from San Francisco to Japan, then driven across that country and transported by boat to Vladivostok. From the later place the route went through Harbin, Tschita, Irkutsk, Tomsk, Nijni Novgorod to Moscow, St. Petersburg, Berlin and Paris. The total distance traveled was 21,000, of which 13,000 were by land.

Because of the Alaskan detour made by the Thomas car and its compulsory return to San Francisco, the Protos, De Dion and Zust cars gained on the Thomas, a lead which eventually enabled the Protos to reach Paris first. It did not prove the winner, however, as the Thomas car was allowed the time for the distance traveled in

Alaska, thereby making it the winner in Paris by 26 days.

### Social Functions of Show Week.

Of the other less formal, but not less pleasant, social functions of the week was the Maxwell-Briscoe Motor Co.'s annual dinner to its agents, which occurred at the Manhattan Hotel on Thursday, and another tendered by President T. C. O'Connor, of the York Motor Car Co., to the Pullman agents who were in attendance at the show. The Maxwell-Briscoe function was unique in that speech making was tabooed, a vaudeville show taking the place of after-dinner oratory. On Saturday evening at the Engineers' Club, A. L. Garford, president of the Federal Mfg. Co., played the host to 16 former employees of the company whom the show had attracted to New York. The previous Saturday several officials and department heads of the Lozier Motor Co. were the guests of John O. Stokes, president of the Thermoid Rubber Co., at his splendid apartments in Hotel Royaltan, several other officers of the Thermoid company also being present. At this dinner the Lozier company was presented with a tablet, 3 by 5 feet, depicting the two victorious Lozier cars on the Brighton Beach track during the record breaking 24 hour race, last fall and embodying a suitable inscription. After the race in question, the Lozier people announced that Thermoid brake lining had helped their cars to victory and the tablet commemorates the fact.

### Speare Completes Contest Board.

Following the appointment of S. M. Butler, of New York, as chairman, President Lewis R. Speare, of the American Automobile Association, has completed the make-up of the contest board and partly completed the technical committee for 1910, by the selection of the following members:

Active members of the contest board—David Beecroft, Chicago; S. B. Stevens, Rome, N. Y.; T. A. Wright, Wilkes-Barre, Pa.; Joseph H. Woods, Newark, N. J.

Associate members of the contest board—Frank G. Webb, Brooklyn, N. Y.; Frank W. Joyce, Minneapolis, Minn.; F. C. Donald, Chicago, Ill.; L. P. Lowe, San Francisco, Cal.; C. H. Gillette, Hartford, Conn.; Harry W. Knights, Boston, Mass.; James T. Drought, Milwaukee, Wis.; R. P. Hillman, Los Angeles, Cal.; P. D. Folwell, Philadelphia, Pa.; Ralph W. Smith, Denver, Col.; William G. Humphreys, Atlanta, Ga.; Harvey Granger, Savannah, Ga.; E. H. R. Green, Dallas, Tex.; Charles B. Shanks, Portland, Ore.; G. P. Bullard, Phoenix, Ariz.; Mason B. McLoughlin, Cleveland, O.; T. C. Campbell, New Orleans; Henry J. Spuhler, Pittsburgh, Pa.; Charles W. Sedwick, Indianapolis; George Lane, Detroit.

# REPRESENTATIVE AMERICAN TIRE FACTORIES

## POWER ABSORBED BY GEAR GREASE

## Experiments Which Prove It to be a Source of Surprising Losses—Lubricants for the Transmission.

That the quantity and quality of lubricant in the housing cause considerable difference in the amount of power absorbed by a transmission is a fact to which attention frequently is called by the manufacturers of one or another brand of grease or oil. But that the power absorption in the gear box alone may range from  $\frac{3}{4}$  to  $1\frac{1}{2}$  horsepower, representing an increase in lost power of 100 per cent. probably will be surprising to many who consider themselves pretty well informed. Such, at least, is the conclusion of an English investigator, Alexander Duckham, whose experiments recently have led him to make a close study of gear box lubrication.

In considering all questions of lubrication of the transmission gears, particularly the change gears, three things are to be borne in mind, namely, lubrication of the bearings and gear teeth, noise in the gears, and leakage. Lubrication alone seems comparatively easy to accomplish, but the accomplishment of the other two objects is attended with more or less difficulty. The matter of power loss necessitated by the churning of the lubricant is one drawback to the use of such pastey sound "mufflers" as sometimes are recommended. It is with this difficulty that the Duckham tests deal. "Noise and leakage appear to me matters of somewhat secondary importance," the experimenter remarks, "the question of power coming first, in my estimation." On this basis he proceeds to put his theory on trial, so to speak, and with results that do not lack interest.

An up-to-date gear box from a 15 horsepower car of well known make was used for the experiments. It had a total capacity of  $3\frac{1}{4}$  gallons, while two gallons of oil just sufficed to cover the shafts. This gear box was coupled up by a flexible coupling to an electric motor provided with the necessary measuring instruments. In all the experiments the second gear was in mesh. The speed of the main shaft was held constant at 1,100 r.p.m. Readings were taken every 10 minutes. Each test was run until the temperature became constant.

Continuing the story of his investigations, Mr. Duckham says:

"In the first place the gear box was well lubricated, and then run empty to ascertain the amount of power required to drive the motor and the gear box, and from this was obtained a basis for comparison, as knowing this constant, all additional absorption of power must be due to the churning action of the gears in the lubricant, or rather to the resistance of the lubricant, in a confined space, to the passage of the gears and

other moving parts. My experiments worked out as follows:

	Horse-power.	Fahr. Temp.
(A) Box empty, but well lubricated.	0.7 0.7	48.0 53.5
(B) Box contained 1 quart of light bodied oil. Teeth just dipping.	0.63 0.51	50.0 55.5
(C) Box contained 2 gallons of light bodied oil.	1.15 1.08 1.02 1.02 0.92	48.0 58.0 62.0 64.0 75.5
(D) Box contained 2 gallons of medium bodied oil.	1.4 1.27 1.15 1.12 1.09	50.0 75.5 38.0 94.0 99.0
(E) Box filled right up and test (D) continued.	1.2 1.17 1.15	94.0 99.5 104.0
(F) Box contained 2 gallons ordinary yellow motor grease.	1.75 1.26 1.20 1.29	52.0 84.0 102.0 108.0
(G) Contained 2 gallons of a grease stated to "increase power," and also to cling.	2.9 1.78 1.5 1.44 1.4 1.38	78.0 94.5 104.0 110.0 114.0 122.5
(H) Box filled right up and test (G) continued.	1.52 1.5 1.5	117.0 127.0 131.0

"The tables show the figures obtained, and the study of these may be of interest. I will only draw attention to one or two points. The difference between running the gear box dry and running it with only one quart of oil (so that the teeth just dipped into the oil) was practically nil, but as the box was filled up to the shaft almost another horsepower was absorbed. With the box absolutely filled with this oil there was further loss of power. It will be noticed that when greases were employed the absorption of power at once jumped up, as did also the temperature. In the case of one well known grease, which is stated to increase the power and cling to the gears, the worst results were obtained. The makers evidently consider that such adhesiveness is a point in its favor. With the ordinary and less sticky type of yellow motor grease the results were somewhat better.

"Taking the extreme cases, it will be noticed that the absorption of power by the lubricant in the box varies from 0.51 to 2.9 horsepower. Therefore it seems advisable that motorists, and especially those that have cars of comparatively small power, should be very careful that the minimum amount of power be absorbed uselessly thus. Taking the case of the man with a car of 10 to 15 horsepower, it is quite easy for him to expend 10 per cent. of the power in churning up a heavy grease.

"I think the tests show that the use of any form of solid lubricant is wasteful of power, and that the same remark also applies to the use of an excessive quantity.

"The difficulty of keeping a thin lubricant in the gear box is no doubt serious, and manufacturers do not seem to pay sufficient

attention to the question. The system frequently adopted of using felt or fibrous packing is bad, because, firstly, if no means be used for compressing it on the shaft it soon becomes inoperative, and secondly, if an adjustable gland be provided, and is tightened sufficiently to keep in the oil, a remarkable amount of friction is introduced, and consequently power absorbed. The method which might be adopted more generally is that used on all electrical plant and high-speed steam engines, and on some petrol motors, viz., the provision on the shaft for a V thrower ring, and a catch-box draining back into the gear box.

"The other objection to a thin lubricant is that it will not deaden the noise, and of course if the gears are badly cut and out of line this is sure to be excessive. But these are exceptions today, and nearly all one's driving, even on small powered cars, is done on top gear with direct drive, and with no wheels in mesh. If more noise results from the small quantity of comparatively thin lubricant I strap a piece of thick saddler's felt around the gear box to deaden it."

## M. C. A. Re-elects All of Its Officers.

President Benjamin Briscoe and all other officers were unanimously chosen to succeed themselves at the annual meeting of the Manufacturers' Contest Association, Inc., which occurred on Saturday last, 8th inst., at the Manhattan Hotel, New York. These officers are: President, Benjamin Briscoe (Maxwell-Briscoe); vice-president, H. O. Smith (Premier); secretary-treasurer, William E. Metzger (Metzger); chairman rules committee, H. E. Coffin (Hudson); assistant secretary-treasurer, Russell A. Field. Directors: Benjamin Briscoe, H. O. Smith, William E. Metzger, H. E. Coffin and Windsor T. White (White).

Other than the election and the rendering of reports by the officers, the chief business of the meeting was the consideration and ratification of the proposed new classification, which, as soon as adopted by the contest board of the American Automobile Association, will be issued in printed form.

Among those in attendance at Saturday's meeting were: Members, George H. Strout, Apperson Bros.; Alanson P. Brush, Buick Motor Co.; E. R. Hollander, Fiat Automobile Co.; H. E. Coffin and C. H. Taylor, Hudson Automobile Co.; H. G. Farr, Knox Automobile Co.; Benjamin Briscoe and C. W. Kelsey, Maxwell-Briscoe Motor Co.; William E. Metzger, Metzger Motor Car Co.; George M. Dickson, National Motor Vehicle Co.; Howard Marmon, Nordyke & Marmon Co.; J. B. Eccleston, Oakland Motor Car Co.; J. Elmer Pratt, Pierce-Arrow Motor Car Co.; George A. Weidely, Premier Motor Manufacturing Co.

Present by invitation: S. M. Butler, chairman contest board of the American Automobile Association; E. A. Moross, Indianapolis Motor Speedway; Frank Nutt, Haynes Automobile Co.

## RECENT PATENTS.

935,228. Attachment for Headlights. Fred-eric J. Pfister, San Francisco, Cal. Filed April 20, 1909. Serial No. 491,090.

1. A device of the class described comprising a pair of toggle levers and a sign-board rigidly assembled with one of said levers and arranged to extend terminally upon the other lever.

935,276. Mud Guard for Vehicles. Harold J. Sharpnel, Brixton, England. Filed Dec. 4, 1908. Serial No. 465,955.

1. In a vehicle, the combination with an upper mud guard arranged to partially encircle a wheel of the vehicle, of a lateral mud guard mounted loosely on the wheel hub and a connection between the said guards, said connection embodying a vertically arranged spiral spring, and being attached to the lateral mud guard and also to the upper mud guard at points approximately vertical above the axle of the vehicle.

935,293. Steering Gear for Motor Vehicles. Robert H. Bowman, Canon City, Col. Filed Oct. 30, 1907. Serial No. 399,908.

1. In a steering mechanism for motor vehicles, a steering shaft provided with a rack wheel, and a sliding foot latch mounted to slide longitudinally on the vehicle platform, adapted to be thrown by the operator's foot into locking engagement with said rack.

935,582. Motor Vehicle. Robert H. Bowman, Canon City, Col. Original application filed Oct. 30, 1907, Serial No. 399,908. Divided and this application filed May 29, 1908. Serial No. 435,617.

In a motor vehicle, the combination with the front truck including two standards connected at their upper ends by a centrally apertured cross piece and bearings on the lower ends of the standards, of a rotary axle mounted in said bearings, ground wheels on the ends of the axle, a king bolt extending at its upper end through said cross piece to form the pivot of the truck and provided at its lower end with a clamp embracing the axle, a reach bar connected at its forward end with the lower end of the king bolt at opposite sides of said clamp, a bevel gear turning on the king bolt adjacent to the upper side of the reach bar and provided with a driving member, and a bevel gear on the axle and meshing with the first named bevel gear, substantially as set forth.

935,583. Speedometer. James H. Bullard and Edwin W. Bullard, Springfield, Mass., assignors to Bullard Specialty Co., Springfield, Mass., a Corporation of Massachusetts. Filed Dec. 21, 1906. Serial No. 348,904.

1. A speedometer comprising a rotatable shaft, centrifugally actuated arms, the free ends of which swing away from the shaft during the rotation of the latter, said arms each having a projection extending at an angle therefrom and provided with a curved edge; springs fixed at one end and carried by the shaft, and bearing against the curved edges of said projections, the effective length of the springs being changed by the swinging movement of the projections on which they have a bearing, and an indicating pointer actuated by the swinging movement of the arms, an elbow lever having one arm operatively engaging the pointer its other arm being actuated by a second elbow lever, the latter being pivoted so as to move in a plane at right angles to the plane of the first mentioned elbow lever, as described.

935,643. Transmission Unit for Motor

Vehicles. Howard E. Coffin, Detroit, Mich., assignor to Chalmers-Detroit Motor Company, Detroit, Mich., a Corporation of Michigan. Filed Nov. 6, 1908. Ser. No. 461,416.

1. In a motor vehicle, the combination with the motor and transmission shaft, of a brake, a transmission variable speed gearing and a main clutch intermediate said motor and transmission shaft, said brake gearing and clutch being organized to be attachable and detachable as a unit from said motor and transmission shaft.

935,644. Clutch. Howard E. Coffin, Detroit, Mich., assignor to Chalmers-Detroit Motor Company, Detroit, Mich., a Corporation of Michigan. Filed Nov. 6, 1908. Serial No. 461,417.

1. In a clutch, the combination with male

and female members, of a flexible facing on one of said members, a removable reinforcing leaf spring for said facing, a stud secured to said spring and extending through a bearing on the clutch member, and an adjustable nut on said stud for limiting the movement of said spring.

935,647. Tire Case. Powell Evans, Philadelphia, Pa. Filed Jan. 2, 1909. Serial No. 470,314.

1. A tire case made of relatively thin sheet material and having within it a reinforcing structure, with a supporting base connected to said reinforcing structure so as to directly receive any load applied to the same.

935,931. High Tension Spark Plug. John Sharp and William Sharp, Cleveland, Ohio. Filed Dec. 9, 1908. Serial No. 466,648.

SEATTLE, 1503 Broadway

1. In combination in a spark plug, a hollow metal body portion, screw threaded for insertion into an engine cylinder, a tapered inner extremity therefor, provided with a chamber, and a semi-globular terminal therefor projecting beyond said tapered extremity, the said terminal provided with a central countersunk orifice and with fine longitudinal slits, communicating with said chamber, and an inner terminal in said central orifice, a central stem connected with said inner terminal, and an insulation therefor, said stem and insulation secured within said hollow body.

936,064. Carburetter. Walter C. Westaway, Rockford, Ill., assignor, by direct and mesne assignments, to J. W. Duntley, Chicago, Ill. Filed Sept. 28, 1905. Serial No. 280,546.

1. In a device of the kind described, a shell or casing inclosing a chamber having a spheriform bottom, a fluid inlet and an air inlet formed in said bottom, and an outlet near the opposite end of said casing, in combination with a spherical segmental spreader positioned within said chamber and arranged to co-operate with the walls thereof to form an annular channel from said inlets to said chamber to bring the inflowing air into contact with the inflowing liquid.

934,144. Steering Gear for Vehicles. Eugene N. Daniels, La Fargeville, N. Y. Filed June 12, 1908. Serial No. 438,228.

1. In a steering gear for vehicles, a supporting member having the ends directed upwardly and provided with transverse apertures, each aperture having an internal stud, a divided axle with the parts extending respectively through said apertures and swinging upon said studs, the inner ends of the axle members having gear segments, a gear wheel supported for rotation upon said supporting member and engaging said segments, and means for oscillating said gear wheel.

934,472. Tire. John S. Stevenson, Detroit, Mich. Filed Dec. 23, 1907. Serial No. 401,740.

1. In a vehicle wheel, the combination with a felly, of spaced inner and outer rims thereon, each of said rims being provided with inwardly and outwardly projecting marginal flanges; the inwardly projecting flanges of the one and the outwardly projecting flanges of the other being hook shaped, and one of each of said outwardly and inwardly projecting hook shaped flanges being detachable, co-operating guide flanges detachably secured respectively to the hooked flanges of the outer rim and to the inwardly projecting flanges of the inner rim, a tire interposed between the rims, a sectional covering for the tube flanged to engage the hook shaped flanges, and a tire encircling the outer rim and seated between the outwardly projecting marginal flanges.

934,639. Tire. Victor E. Van Cantfort, Akron, Ohio. Filed April 18, 1908. Serial No. 427,910.

A tire comprising a body portion and a separate tread united thereto by vulcanization, said tread provided, previous to its vulcanization, with a plurality of bolts having threaded shanks positioned in suitable apertures therein, extending from the inner face thereof outwardly and projecting therefrom, the heads of said bolts adapted to rest on the outer surface of the original tire body when said tread is united thereto, a strip of wear resisting material positioned on the outer surface of said tread after vulcanization constituting a protective covering therefor, nuts adapted to be secured on

the threaded ends of said bolts to engage said protective covering, thereby maintaining the same in snug engagement with said tread and constituting protuberances for receiving the wear and preventing skidding of said tire and means extending longitudinally of said bolts for locking said nuts thereon, whereby said nuts are locked against rotation irrespective of the wear thereon.

934,731. Transmission Gearing. William E. Jenkins, Milton, Pa. Filed Nov. 25, 1908. Serial No. 464,415.

1. In a transmission gearing the combination with a frame, of driving and driven wheels, spherical discs in engagement with the driving and driven wheels, a shaft mounted on the frame, friction wheels mounted on the shaft and means for moving the shaft for causing the friction wheels to be brought into contact with the driving and driven wheels for reversing the motion of the driven wheel.

925,033. Vehicle Tire. Clinton H. Knecht, Akron, Ohio. Filed Aug. 26, 1908. Serial No. 450,359.

1. In a vehicle tire, the combination with a clencher rim, of a tire, and opposed retaining devices independent of each other embedded in the base of the tire and having bevel faced overlapping extremities acting upon each other to hold the tire in positive locking engagement with the rim.

## BROWN-LIPE SEPARATES INTERESTS

**Transfers Its Differential Gears to a New Company—Control, However, Remains with Former Principals.**

Hereafter the Brown-Lipe differential gears and the Brown-Lipe transmission and steering gears will be made and marketed by separate but related companies, the Brown-Lipe-Chapin Co. having been formed to take over the differential gear department of the Brown-Lipe Gear Co.

The Brown-Lipe-Chapin Co. is being incorporated under the laws of New York State with a capital stock of \$1,500,000, all of which has been subscribed for by the present stockholders of the Brown-Lipe Gear Co. and C. S. Mott. The officers of the new company will be Alex T. Brown, president; W. C. Lipe, vice-president; H. W. Chapin, secretary and treasurer, who with C. S. Mott and H. J. Mallory, of Flint, Mich., will compose the board of directors. The business will be managed by H. W. Chapin, who for the past 15 years has been manager of the Brown-Lipe Gear Co., which office he will retain, also. The new company will assume all contracts of the old one and will continue its policies. The Brown-Lipe Gear Co. will turn over all its men, machinery and equipment used in the production of differentials and about July next they will be installed in a separate factory, which is to be erected in Syracuse, N. Y., near the present Brown-Lipe plant. The site already has been secured and the plans call for a six story fireproof building having floor space of 150,000 square feet.

Manager Chapin states that the new arrangement was made absolutely necessary by the demand for the Brown-Lipe productions. It was either a case of "standing pat" and refusing new business or expanding and taking care of all that offered and the principals of the company voted for expansion.

Reports that had been circulating that the Brown-Lipe business would be absorbed by the General Motors Co. are positively denied by Manager Chapin. He states that the would-be trust is not directly or indirectly, or in any way interested in the business. The reports undoubtedly grew out of the connection of C. S. Mott, of the Weston-Mott Co., with the new Brown-Lipe-Chapin Co. The Weston-Mott company makes wheels and axles and supplies them to the General Motors concern; for six or eight years it has used the Brown-Lipe differentials, and Mott and Chapin long have been warm personal friends, and Mott's connection with the new Syracuse project is due to this state of affairs. As a matter of fact, although the General Motors' "wizard" has the Weston-Mott company listed as a General Motors' property, it is no secret that it does not even hold the controlling interest in it.

### St. Louis Company Gets Indiana Site.

The Standard Automobile Co., of St. Louis, Mo., has "signed up" to establish its plant in Wabash, Ind., taking a now idle bridge and iron works as its factory. The company is to be reorganized with \$500,000 capital and has been guaranteed \$42,500 subsidy by the citizens of Wabash, through the Wabash Exchange. C. J. Wardwell is to be the resident manager.

### Matlack Now with General Motors.

J. C. Matlack, who resigned the general management of the Michelin Tire Co. to become identified with the General Motors Co., and later decided to go into business on his own account, has been induced to change his mind. He last week "signed up" with the General Motors people.

### Barnes to Work in Two Cities.

Claire L. Barnes, general sales manager of the Billings & Spencer Co., of Hartford, Conn., is establishing offices in Detroit, Mich., to enable him to give the Detroit business his personal attention. He will divide his time between Detroit and the factory office at Hartford.

## ORGANIZING LICENSED DEALERS

**First Official Move Made in New York in an All-Embracing Campaign—Los Angeles Already had Acted.**

As a further step in the organization of the licensed forces, following the granting of Selden licenses by the Association of Licensed Automobile Manufacturers to a large list of established manufacturers who heretofore have been operating as "independents," the agents and branches handling licensed cars in the various cities are organizing local associations of licensed dealers. The local associations, among other things, are to endeavor to create a clear "sheep and goats" distinction with the public between their members and the dealers handling unlicensed cars, and are to undertake the direct work of informing prospective buyers as to the patent situation relating to cars.

The movement really started in Los Angeles, Cal., where, entirely on their own initiative, the dealers who handle licensed cars, as was reported by the Motor World at the time, several weeks since organized The Licensed Dealers' Association of Los Angeles, and took generous space in the newspapers to proclaim the dangers to the retail buyer in purchasing an unlicensed car, and to publish the names of the licensed dealers and the cars they handle. The organization also has gone further in its attempts to "freeze out" the dealers in unlicensed cars by promoting its own hill climb and other competitive events.

A call for an organization along similar lines has now been issued in New York City, not directly because the metropolitan dealers have been impressed with the Los Angeles example, but in accordance with a program which it is indicated is to be carried out all over the United States. The call is signed by eight prominent agents and branches and has been sent to all of the 54 New York dealers handling licensed

cars. The first organization meeting is scheduled for this afternoon (Thursday), at the Hotel Astor.

As one of the reasons for issuing the call, it is stated that "the interests of those who buy motor cars should be protected against dealers who are selling cars which infringe the Selden patent" and also that "purchasers should be fully informed as to the importance of buying only those cars that are licensed."

Following the organization of the New York licensed agents and branches and a carrying into effect of some of the plans which have been laid out for it, the licensed dealers in the other cities will be brought to see the desirability of like associations. When the chain is completed the aggregate of forces working directly in contact with the public is expected to be of powerful effect in carrying the "Licensed" gospel and spreading popular information concerning the Selden patent and its relation to cars.

#### Smith to Leave Kansas for Michigan.

Negotiations practically have been concluded which will result in the main plant of the Smith Automobile Co., of Topeka, Kan., being moved to Grand Rapids, Mich. The present capitalization of the concern is \$200,000, of which \$180,000 has been paid in, but a committee representing the Grand Rapids underwriters is to recommend an increase to \$500,000. The transplantation is largely through the efforts of the industrial committee of the Grand Rapids Board of Trade. Under the new arrangement the officers of the company will be O. H. L. Wernicke, president; E. D. Conger, treasurer, and these, with Arthur C. Denison, directors on the board. The men named constitute the local committee acting for the underwriters. Local citizens are to be asked to take stock on the same basis as the underwriters. The company, which styles its product as the Great Smith car, has been making automobiles for several years, chiefly for Western distribution.

#### Lotz Would Build Cars, and Tires, Too.

Not only to build cars, but to manufacture tires as well, another new company has been launched in Detroit, Mich., to be known as the Lotz Auto Co., and capitalized under Michigan laws at \$300,000. John A. Lotz, a Detroit real estate man and one of the principal stockholders, announces that a factory site has been secured on Harper avenue, where a factory will be completed in the spring. Associated with him in the enterprise are John McQueen, Arthur A. Fletcher, George Cooley and Joseph Christian, who is described as a wealthy Chicagoan. The cars which are projected are a combination runabout and a four and a six cylinder touring car, at prices ranging from \$600 to \$1,500, while the tire which is to be manufactured is the invention of George Cooley, of Grand Rapids, and is described as being designed "to avoid the necessity for pneumatic tires."

## DELAY IN INJUNCTION HEARING

### Postponement Due to Absence of Studebakers' Chief Counsel—E-M-F. Exhibits a Volume of Dealers' Complaints.

All the injunction proceedings of the Studebaker Automobile Co. against the E-M-F. Co. now being centered before Judge Swan, in the United States Circuit Court at Detroit, Mich., the whole fight is being waged before that court. Both sides have filed voluminous affidavits, and the E-M-F. Co., in addition, has prepared a printed volume of letters from dealers who express dissatisfaction with the system under which the Studebakers have been distributing the E-M-F. cars. The book contains 128 pages and has 142 exhibits from automobile dealers in all parts of the country who state their grievances.

The hearing of the case was to have been taken up on Tuesday, but the principal counsel for the Studebaker company, John S. Miller, who is referred to by the Studebakers as the man who averted the payment of the \$29,000,000 fine against the Standard Oil Co., was detained in Chicago as counsel for John R. Walsh, the convicted banker. The explanation was made to the court by General H. M. Duffield, of counsel for the Studebakers, and was corroborated by Elliott G. Stevenson, of counsel for the E-M-F. Co. It was finally agreed that the injunction hearing shall take place on next Tuesday, 25th inst.

Great emphasis is placed by the E-M-F. co. on the objections by dealers to the Studebaker method of placing the cars. Letters from other manufacturers of cars are submitted to show that the 12 per cent. dealers' discount which in many cases was all that was allowed, is not as great as is considered desirable or reasonable by car manufacturers in general. The hardship of compelling dealers to take the larger and more expensive cars in addition to the E-M-F. in order to obtain a better discount than 12 per cent. also is dwelt upon, and among the exhibits is a contract between the Boston branch of the Studebaker company and a dealer in Manchester, N. H., which provides that a 12 per cent. discount would be allowed on E-M-F. cars and an additional 3 per cent. provided the dealer also bought a Studebaker-Garford car. Other dealers state that they were offered but 10 per cent. on the E-M-F. cars and only 5 per cent. on the new Flanders, while complaints also appear in the exhibits to the effect that the prices charged for parts was greater than the dealers had been lead to expect by the published prices in the E-M-F. parts catalog. The papers filed by the Studebakers relate more directly to the matter of the circumstances of the various contracts and agreements with the E-M-F. Co., with a view to establishing the com-

plainant's rights as exclusive distributor of the product.

#### Changes by Well Known Tradesmen.

M. B. Fetcher, who for eight years has been in the retail automobile trade in Denver, Col., has joined the forces of the Premier Motor Mfg. Co., of Indianapolis, Ind. He will be traveling representative of the company.

Wilbur Hobbs, manager of the Michelin Tire Co.'s New York branch, has resigned that office to become manager of the Morgan & Wright branch in the same city. He succeeds E. F. Hilton, who recently tendered his resignation.

Edward T. Birdsall, M. E., one of the New York's pioneer dealers, but latterly more prominent in the role of designing engineer, has joined Bradenburg & Co., of New York and Chicago. The company has the wholesale selling agency for motors, parts and a number of accessories.

Frank B. Wood has become manager of the Chicago branch of the Knox Automobile Co., succeeding J. W. McCausland, who has resigned to go into the manufacturing end of the industry. Wood formerly conducted an automobile business in Elgin, Ill., but has been a salesman in the Knox branch for some months.

H. R. Doty, who has been sales manager for the southern half of the Western sales department of the White Co., of Cleveland, O., has been transferred from Chicago to San Francisco, where he will act as assistant manager of the Pacific Coast department. He has been succeeded in Chicago by J. O. Sackman.

#### Detroit Roller Bearing is Settled.

The Detroit Roller Bearing Co., of Detroit, Mich., making Zahn bearings for motor cars, has completed its new factory and has effected a complete transplantation of the business from Los Angeles, Cal. The plant is at 192 Piquette avenue. The concern had its reorganization about two months ago, J. M. Hibbard being made president and general manager.

#### Los Angeles Votes for a Show.

Dates have been selected for an automobile show at Los Angeles, Cal., which is to be held in the Grand avenue rink. At a meeting of the Automobile Dealers' Association of Southern California, attended by 35 dealers, it was decided to hold the show February 8 to 14, and committees were appointed for its management.

#### Bedstead Makers Abandon Car Project.

Failing to get the capital which it had relied upon to support it in the manufacture of automobiles, the Richmond Mfg. Co., of Richmond, Ind., has abandoned motor car making for the present and will devote its entire attention to the manufacture of automobile and carriage lamps. The company formerly made bedsteads.

**MITCHELL INTERESTS ARE COMBINED**

**Wagon and Automobile Concerns Linked  
in New \$10,000,000 Company—Big  
Plans that Will Mature.**

Capitalized at \$10,000,000 and taking in the Mitchell Motor Car Co., together with the Mitchell & Lewis Co., a new, combined company has been organized in Racine, Wis., to be known as the Mitchell-Lewis Motor Co. and which hereafter will be the producing company for Mitchell cars. The Mitchell Motor Car Co. has long been conspicuous in the trade, while the Mitchell & Lewis Co. has been manufacturing farm and spring wagons since 1834. The combination concern will not only produce Mitchell cars in greater number than ever before, but also will manufacture farm and spring wagons, motor trucks, light motor delivery wagons and a light combination motor business wagon for farmers' use. The facilities of the two constituent companies will permit the new company to manufacture all its own bodies, springs, castings and details of its products.

The amalgamation is headed by Captain William Mitchell Lewis, son of William T. Lewis, who heretofore has been the head of both concerns. In addition to President Lewis the officers are Henry C. Mitchell, vice-president; George B. Wilson, second vice-president; Frank L. Mitchell, treasurer; G. Vernor Rogers, designer; John W. Bates, superintendent; James W. Gilson, sales manager; William T. Lewis, chairman of the board of directors.

All of the \$10,000,000 capital stock is held in the Mitchell and Lewis family lines and there will be no bonds or large floating indebtedness. William T. Lewis will retire from active work, but as chairman of the board of directors will remain in an advisory capacity. The combined plants cover about 60 acres. New executive buildings are rapidly nearly completion, as the amalgamation has been in process of consummation for some time.

**Credit Association Eats and Elects.**

The Automobile Trade Credit Association, with headquarters in New York City, held its annual meeting at the Hotel Astor last night (Wednesday), the business session being followed by a banquet at which President Carl Kaufman presided and which was the occasion for a number of short speeches. Two directors were elected for three year terms, these directors being Carl Kaufman, of the Motor Car Equipment Co., New York City, and J. J. Kohn, of the Non-Pareil Horn Mfg. Co., Brooklyn. W. B. Lasher, of the Weed Chain Tire Grip Co., New York, resigned as a director, with an unexpired term of two years. He retired owing to the fact that his company is a constituent of the United Manufacturers

which already has one representative on the board in E. C. Wilcox, of the Connecticut Telephone & Electric Co., of Meriden, Conn. The unexpired term will be filled by M. J. Martin, of the George H. Haws Co., New York, who was elected Lasher's successor. The association, which is four years old and has 93 members, has decided to increase its membership, and to this end has made itself a committee of the whole to seek desirable members.

**Palmer & Singer Increase to \$1,000,000.**

Having practically completed its new factory in Long Island City and being about to commence the manufacture of P-S cars on a larger scale than in the past, the Palmer & Singer Mfg. Co., of New York City, is to increase its capitalization from \$400,000 to \$1,000,000. The notice of the proposed increase was filed with the Secretary of the State of New York last Monday.

**Corbin to Produce Six Cylinders.**

Heretofore confining itself to four cylinder cars, the Corbin Motor Vehicle Corporation, of New Britain, Conn., is developing a six cylinder model. The car is to be of 48 horsepower, with a wheel base of 124 inches, and the chassis is designed to accommodate several types of body, from a two passenger runabout to a seven passenger touring type.

**Twyman to Manage E-M-F. Sales.**

B. W. Twyman has become the sales manager of the E-M-F. Co., of Detroit, Mich. His extensive experience in both manufacturing and retail fields is regarded as especially qualifying him in handling agency matters and the large problems of the selling field.

**Grant-Lees Erecting Concrete Factory.**

The Grant-Lees Machine Co., of Cleveland, O., making gears and other parts for the automobile manufacturing trade, is erecting a three story concrete factory. The new building will permit a doubling of the present output.

**Fire Damages Ohio Tire Plant.**

The Mansfield Rubber Co., of Mansfield, O., which recently commenced the manufacture of tires, was visited by fire on the 12th inst. The damage in the machine shop and rubber room was approximately \$20,000.

**Factory Society with 1,400 Membres.**

The Franklin Mutual Benefit Society, which is composed of employees at the automobile factory of the H. H. Franklin Mfg. Co., in Syracuse, N. Y., has 1,385 members. The membership is fast increasing.

**Moody Leaves Branch for Factory.**

C. W. Moody has been appointed general sales manager of the Swinehart Clincher Tire & Rubber Co., of Akron, O. He formerly was manager of the Chicago branch of the Pennsylvania Rubber Co.

**WHO WANTS TO BUY \$200,000 SUIT?**

**One of Daimler's Bankrupt Creditors Invites Bids for Large Claim—Patents and Other Things for Sale.**

A bankruptcy sale is scheduled for February 9th of certain large claims against, and majority stock and full control of, the Daimler Mfg. Co., of New York City, which at one time made the American Mercedes at Long Island City and which is referred to by the trustee in bankruptcy of Kessler & Co., formerly bankers of 54 Wall street, as "a New York corporation which apparently has the right to control the manufacture, importation and sale of the Mercedes motor car in the United States." The disclosure by the trustee as to what the remaining assets of the concern consist of is in the nature of a revelation as to some of the tangles of the automobile industry where the reproduction of a foreign car in America is concerned, and incidentally it gives evidence of the amazing expectations at one time entertained by M. Charley, of Paris, and others concerning the probable sale of imported cars on this side of the Atlantic.

Of the various things which the trustee ventures to suggest as assets, there are named "very valuable contracts, United States letters patent, claims for damages for breaches of contract, and for infringement of said letters patent, and other property." Also there will be turned over to the purchaser of the claims and stock certain books of record and accounts, papers, patterns and the like.

An imposing list of United States patents is presented, to the extent of 37 or more, together with numerous assigned applications, not to mention a trademark and a dozen Canadian patents. Of the contracts the two most important are the agreement with the Daimler Motorenengesellschaft, of Cannstatt, Germany, dated August 10, 1900, and that with C. L. Charley, of Paris, dated June 29, 1906.

The first, as summarized by the trustee, "in substance and effect assigns and agrees to assign all inventions and improvements made and thereafter to be made, owned or controlled by the German company, and all United States and Canadian letters patent then issued or thereafter to be issued therefor."

For the second a "minimum face value of \$62,500" is given. The agreement affords an exclusive license to Charley to import and sell the Mercedes car in the United States, for which Charley agrees to pay a minimum royalty of \$100 a car, and a minimum aggregate of not less than \$12,500 per year. The agreement runs five years, from January 1, 1908, to December 31, 1912. "No payments have thus far been made under the contract," the trustee ex-

plains, "for reasons which can be explained." Thus is the "minimum face value" of \$62,500 obtained.

A damage suit for \$200,000 against the Daimler Motorenengesellschaft is also to be considered, though the trustee places no especial emphasis on its having a \$200,000 "face value." The exact nature of whatever other treasures the purchaser might get is not dwelt upon.

"Owing to controversies which have arisen between the Daimler Mfg. Co. and Daimler Motorenengesellschaft and due also to the destruction of its principal plant by fire, the withholding of payments due to it, and the consequent foreclosure and sale of its shop and land in Long Island City (Astoria)," says the trustee, "the Daimler Mfg. Co. has been obliged (temporarily only, it is hoped) to suspend active business, and some small judgments, etc., have been entered against it, but it is believed that the value of the assets, properly husbanded, is enormously in excess of its legitimate liabilities."

The sale is to be of the claims of Kessler & Co. against the concern and 2,401 3-5 shares of its common stock and 10 shares of its old stock, which latter are worth 5 shares of the newer common stock. All of these shares are a majority of the stock issued and outstanding and carry control of the company. A general statement of the Kessler claims against the company makes the modest total of \$296,190, consisting of an open account balance as of August 1, 1904, about \$138,900; open account C. M. Bouggy, president, balance after deducting sundry payments, about \$16,500; note dated February 17, 1904 (collateral 1,341 shares preferred stock of company replighted), interest apparently paid to August 1, 1904, \$134,000; and a note dated December 14, 1901 (collateral 669-10 shares preferred stock of company attached), \$6,690. The 1,341 shares of preferred stock referred to is to be sold as a separate lot, immediately following the sale of the open accounts and common stock, which are to be disposed of at public auction through Adrian H. Muller & Son, auctioneers, at Exchange Salesrooms, 14 and 16 Vesey street, New York City, at 12.30 p. m. on the 9th prox. While making no representations or warranties, the Kessler trustee, Lawrence E. Sexton, 68 William street, New York, aims "to facilitate inquiries and investigations of persons interested, or likely to be interested in the proposed sale," but warns everybody that "purchasers must make their own investigations."

#### Changes Name; Will Build Trucks.

The William F. Kramer Co., of Dayton, O., has changed its name to The Buckeye Wagon & Motor Car Co. and has raised its capitalization from \$10,000 to \$50,000, preliminary to launching into the manufacture of motor cars. The company plans to make commercial vehicles.

#### THE WEEK'S INCORPORATIONS.

Nashville, Tenn.—Blomberg Automobile Co., The, under Tennessee laws, with \$10,000 capital.

Newcastle, Ind.—Newby Automobile Co., The, changes name to The Maxwell-Briscoe-Newby Co.

New Haven, Conn.—Werle-Maley Co., under Connecticut laws, with \$5,000 capital; to deal in automobiles.

Philadelphia, Pa.—Motor Car Supply Co., under Pennsylvania laws with \$50,000 capital. Corporators—F. M. Bell and others.

New Orleans, La.—Aschaffenberg Motor Co., under Louisiana laws, with \$100,000 capital. Corporators—A. Aschaffenberg and others.

South Bend, Ind.—Diamond Automobile Co., The, under Indiana laws, with \$100,000 capital. Corporators—C. G. Moore and E. Ricketts.

Detroit, Mich.—Lotz Auto Co., The, under Michigan laws, with \$300,000 capital; to manufacture automobiles. Corporators—John A. Lotz and others.

Perth Amboy, N. J.—Packer House Garage Co., The, under New Jersey laws, with \$50,000 capital; to take over the business of the Packer House Garage.

Louisville, Ky.—Southern Auto Co., The, under Kentucky laws, with \$18,000 capital. Corporators—W. H. Montgomery, W. H. Leusing and William A. Baker.

Buffalo, N. Y.—Chittenden Motor Car Co., The, under New York laws, with \$10,000 capital. Corporators—Ralph W. Pierce, Lorens P. Chittenden and Samuel F. Pratt.

Dover, Del.—American Engine & Motor Co., The, under Delaware laws, with \$1,000,000 capital; to manufacture and deal in automobiles, motor vehicles and power boats.

Philadelphia, Pa.—Times Square Automobile Co. of Pennsylvania, under Pennsylvania laws, with \$5,000 capital. Corporators—Louis Mansbach, New York, N. Y., and others.

Denver, Col.—Fawcett Motor Co., The W. C., under Colorado laws, with \$50,000 capital; general sales and garage business. Corporators—W. C. Fawcett and George Packer.

Troy, N. Y.—Troy Garage Co., The, under New York laws, with \$20,000 capital. Corporators—Roy V. Rhodes, Pierce H. Russell, Alvan E. Mambert and W. A. Thomas.

Dayton, O.—Kramer Co., William F., changes name to The Buckeye Wagon & Motor Car Co., and increases capital from \$10,000 to \$50,000; to manufacture commercial vehicles.

Sheboygan, Wis.—Maurer Garage Co., under Wisconsin laws with \$15,000 capital; general automobile business. Corporators—Albert G. Maurer, William Caspar and Fred C. Voight.

New Albany, Ind.—Indiana Specialty Co., The, under Indiana laws, with \$10,000 capital; to manufacture automobile parts. Corporators—August Kahler, Anton Kahler and Margaret Kahler.

Celina, O.—Western Ohio Automobile Co., under Ohio laws, with \$10,000 capital. Corporators—Samuel J. Vining, Ed. H. Merzman, Walter J. Merzman, M. J. Hemmert and Ed. L. Bryson.

Buffalo, N. Y.—Superior Motor Vehicle Co., under New York laws, with \$200,000 capital; to manufacture and deal in motor vehicles, etc. Corporators—H. A. Kamman, J. W. Lansing and I. T. Gleason.

Detroit, Mich.—Owen Motor Car Co., under Michigan laws, with \$500,000 capital; to manufacture automobiles. Corporators—E. A. Turnbull, Fred W. Hodges, Angus Smith, R. R. Owen and Henry Russell.

Auburn, Cal.—Placer Machine and Auto Co., under California laws, with \$25,000 capital. Corporators—Carroll D. Lecher, Albert J. Lecher, Jasper Hodkin, Walter T. Crosby and Walter F. Jacobs, all of Auburn.

Detroit, Mich.—U. S. Auto Top Co., The, under Michigan laws, with \$20,000 capital; to manufacture automobile accessories. Corporators—William A. Paul, Fred A. Hood and Leroy S. Anderson, all of Jackson.

Troy, N. Y.—Troy Garage Co., The, under Ohio laws, with \$20,000 capital; general automobile business. Corporators—R. H. Kissinger, F. S. Armstrong, Kerr R. Hosey, Theodore A. Watterson and R. L. Patterson.

Minneapolis, Minn.—Hughes Motor Car Co., The, under Minnesota laws, with \$50,000 capital; to operate electric vehicle garages. Corporators—M. L. Hughes, George H. Strickland, Raymond L. Lunt, and others.

Columbus, O.—Iroquois Garage Co., The, under Ohio laws, with \$20,000 capital; to take over the business of the Columbus Garage & Machine Co. Corporators—Fred Luchtenberg, H. L. Thuma and C. R. Hambleton.

Chicago, Ill.—Lange & Brothers Co., Charles, under Illinois laws, with \$5,000 capital; to manufacture and repair buggies, wagons and automobiles. Corporators—Alvah T. Martin, Adolph C. Gresen and Anton Pinger.

Granville, N. Y.—Walker Chain Mat Co., under New York laws, with \$25,000 capital; to manufacture chain mats and other contrivances used on automobile tires. Corporators—M. A. Carter, E. Williams and W. F. Owen.

St. Louis, Mo.—Tower Grove Motor Car Co., The, under Missouri laws, with \$5,600 capital; automobile repair business. Corporators—Thomas W. Wiley, Richard P. McClure, Jr., Horace B. Wiley and Fred L. Schleicher.

## IN THE RETAIL WORLD.

The Goodyear Tire & Rubber Co. has opened a branch in Minneapolis, Minn.; it is located at 915 First avenue, South.

The Utility Car Co., New York City, has leased the two story stable building at 106 West Thirtieth street, and when alterations are completed will occupy it as a garage.

The Ohio Auto Co. has been formed in Columbus, that state, and soon will "hang out its shingle" on a new garage. The company will represent the Rider-Lewis cars.

Shoemaker & Smith, Indianapolis, Ind., have opened salesrooms in the Penway building at Pennsylvania and New York streets. They will act as state distributors for Parry cars.

The Curtis Automobile Co., Milwaukee, Wis., has leased the property at Eighth street and Grand avenue and will erect a garage thereon. It will be a three story structure 45x105 feet.

George Hoskins has purchased the Saunders estate on Housatonic street, Lee, Mass., where he will erect a garage. It will be a corrugated iron building and will include a repair shop.

The Prothero-McGinnis Auto Co., Baraboo, Wis., is preparing to erect an addition to their present establishment. The new structure will be 44x90 feet, and will be used for a machine shop.

The Rome (Ga.) Garage Co.'s establishment and four cars were destroyed by fire last week, in a blaze which swept several buildings at Third avenue and Broad street. The total loss was \$18,000.

William E. Taft, Athol, Mass., has taken over the garage formerly conducted by Richardson brothers, who have dissolved partnership and retired from the management of the establishment.

Fire destroyed the automobile repairshop of Justus Moore, in the rear of 628 East Capitol avenue, Springfield, Ill., last week, six cars going up in smoke. The total loss was \$7,000, partially insured.

The Parker Garage, Minneapolis, Minn., a new establishment which claims to be one of the largest and best appointed in the Northwest, has opened its doors. It is situated at Tenth street and Mary place.

Clarkson Lindley, Minneapolis, Minn., has let the contract for the erection of a two story garage building, 40x126 feet, at Hennepin avenue and Fifteenth street. The structure will represent an outlay of \$18,000.

A discharge in bankruptcy has been granted Edward B. Underhill, treasurer of the Vanderbilt Cup Garage, of New York City. His liabilities were \$9,693, including those obligations which he became responsible for in connection with the garage.

The Chicago E-M-F. Co. has been organized to handle that car in the Windy City and has taken the quarters at East Twenty-first street and Michigan avenue, formerly occupied by the Oldsmobile company.

Stuart McDonald is manager of the new concern.

Leon Rundell, Utica, N. Y., who at present conducts a repair shop in that place, is to have a new garage, work on which will be begun in the spring. Its dimensions will be 25x50 feet and it will be located on Clawson street, near South Main street.

The Atlas Motor Car Co., Cincinnati, O., has begun business at 3527 Reading road and will represent the Inter-State cars. Mrs. F. B. Williams, formerly connected with several other garages in the Queen City, will be chief factotum of the new concern.

The Holdman Motor Car Co., Hutchinson, Kan., formerly located on North Main street, has removed to the remodeled Palace livery stable at 101 East Sherman street. In its new quarters the concern has 9,700 square feet of floor space and will specialize on repairing.

The Aschaffenburg Motor Car Co., New Orleans, La., which recently entered the local automobile field, has purchased the Herwig property on St. Charles street and will erect a large and handsome garage on the site. The property changed hands at a figure said to be \$52,000.

The Packer House Garage Co., Perth Amboy, N. J., has taken over the Packer House Garage and will conduct a garage and supply business. The new concern has leased part of the building at 70 Smith street and when alterations are completed, it will have considerably more "elbow room."

Work has begun on a new home for the Indianapolis, Ind., branch of the Maxwell-Briscoe Motor Co. It will be a three story brick structure, costing \$60,000, and is situated at Illinois and Vermont streets. The first floor and basement are expected to be ready for occupancy by February 1.

Automobile dealers of Brooklyn, N. Y., have formed the Brooklyn Automobile Trade Association with the following officers; W. H. Kouwenhoven, president; Lew H. Allen, first vice-president; Joseph D. Rourk, second vice-president; C. M. Bishop, secretary, and F. C. Kirkham, treasurer.

The Iroquois Garage Co., Columbus, O., has been formed to take over the business of the Columbus Garage & Machine Co., in West Mound street, but there will be no change in the personnel of the present management. The concern handles the Empire pleasure and Grabowsky commercial cars.

Cocklin & Rickey, Griswold, Iowa, have embarked in the automobile business in that town, and have taken a long term lease of a new garage which is to be erected for them. The building will be 25x120, of brick construction, will include a well equipped repair shop and is to be ready for occupancy by May 1.

Indianapolis, Ind., has received another addition to its retail automobile colony through the formation of the Reliable Auto Exchange, which has leased a three story building at 840 East Washington street.

The company has the state distribution of the Continental "35" pleasure cars, and the Atterbury line of commercial vehicles.

The Franklin Motor Car Co., Philadelphia, Pa., has taken possession of its new building at 3430 Chestnut street, which is one of the model establishments of its kind in the Quaker City. The structure is 40x120 feet, two stories, and is built of brick with marble and terra cotta trimmings, in colonial style of architecture. Franklin cars are handled exclusively.

The C. P. Kimball Co., Chicago, Ill., one of the old line carriage manufacturers who have extended their operations to the making of automobile bodies, have purchased a plot on Michigan avenue, near Twentyninth street, 100x161, making their total holdings at this location 400 front feet. Plans have been drawn for the erection of a new building on the site, which will cost \$500,000 and will be entirely devoted to the company's automobile department.

The Hughes Motor Car Co., Minneapolis, Minn., is the latest accession to the trade in that city, and will devote itself exclusively to the sale of electrics, having the state agency for the R. & L. product. Ground has been purchased on Harmon Place, on which a garage 66x165 feet will be erected at an expenditure of \$20,000. M. L. Hughes, George H. Strickland and Raymond L. Lunt are the organizers of the new concern, which will establish branches in St. Paul and Duluth.

Garage building in Denver, Col., is quite brisk at present, no less than four large establishments being under way. The W. C. Fawcett Motor Co., one of the recent recruits to the local trade, is putting up a \$25,000 structure at 1249-55 Broadway, to be occupied as a salesroom and garage; it will be 50x150 feet, two stories, with a plate glass front. The Denver Omnibus & Cab Co., the Studebaker Co., and the Carstarphen Co. are the others who are increasing their garage facilities by new additions.

## Priest Blesses a New Jersey Garage.

Owners of new garages who would invoke spiritual blessings and protection for their establishments should follow the custom instituted recently by William J. Moran, of Jersey City, N. J., who had his garage dedicated by a Catholic priest. The ceremony, the only witnesses of which were Mr. and Mrs. Moran, consisted of prayers and the sprinkling of holy water on the walls of the building, these rites being prescribed for the dedication of public buildings under the laws of that church. Moran lays claim to the distinction of owning the only garage in the country which has been blessed by a priest, which assertion is not likely to be disputed, and although as a rule the usual garage is not pervaded by a Sunday school atmosphere, it is possible that the Jersey City emporium will prove a model of its kind in this respect.

**No Piece-Work—No Over-Time  
No Nightwork—No Rush Methods**

**are permitted in the manufacture of**

**WHITE** **Steam  
and  
Gasoline** **CARS**

**Q**UALITY is the fundamental requirement in constructing White steam and gasoline cars and no manufacturing methods which might endanger quality are permitted in the White factory.

The workmen are paid by the hour—not by the piece—so there is no incentive for them to devote less time and care to any operation than is its due. No over-time work is permitted, because work so done is generally not so painstaking as it should be. We do not employ a “night shift” because in this way responsibility is divided and work done by artificial light cannot be as good as that done by daylight. Finally nothing is rushed through the White factory. Each operation is allotted the full time necessary to secure the highest standard of quality.

### Continuance of Brake System Defects.

Refinement in automobile design, despite the nimbleness with which it is juggled about as a showtime slogan, is not impressively rapid in making some of its advances. Certain purely mechanical weaknesses in many otherwise unblemished cars have been continued for a surprising length of time. But happily, it would seem that a point has now been reached when they are fast being overcome. For example, it required at least three years after the common run of cars had reached a point of normal standardization to achieve the really trustworthy and reliable brake. Following that advantage, it required all of another year to bring about a general apparent disposition to arrange the linkage by which the brake is applied in a way that would meet the approval of a designing engineer working in any other line than that of automobile construction.

On a large number of cars seen at the two New York shows it was to be observed that

changes had been brought about in the braking mechanism such that the actuating rods were brought inside the frame, out of harm's way, and also in such fashion that the tension to which they are subjected would come directly in the plane of movement of the rocker arms through which the entire braking force must be applied. This, together with the growing use of lever balancing devices, is most commendable practice.

On some cars otherwise acceptable braking systems still are used in which the rods are carried outside the frame, and therefore subject to external injury, and in which the more serious defect is found that the stresses of normal service instead of being applied directly to the working points, may be deflected in pulling the arms out of line, tending to cause the bands to bear unevenly on the drums. Or, worse yet, in some cases, part of the braking force goes to straighten out kinks in the rods, which have been given them in order to provide clearance for some obtruding frame member or mechanical part. Exactly what justification can be found for such layouts is difficult to see, unless it be, as the observer might be led to suspect in some instances, that the brakes are more or less an afterthought in the assembly.

This is a day of careful design in which every part of the average car shows evidences of close study and where haphazard methods of building are not encouraged. At the same time, it is possible still to find several instances in addition to the one in question, wherein it would seem that not a few designers are sticking too close to the draughting board and are studying their cars more with an eye to convenience in building and less with a view to long-continued serviceability than they should do.

### Making a Commercial Vehicle Market.

It is simply amazing how slowly even well-posted members of the industry are coming to recognize the fact that the commercial vehicle already is an assured success. It is true that a not inconsiderable number of alert and enterprising manufacturers are now devoting their attention exclusively to this section of the field with generally satisfactory results to themselves and to their customers. It also is a fact that the business vehicle project is being taken hold of by the to-be-expected number of triflers and ill-equipped prospectors who are lured on by the great apparent

wealth of possibility which the bare facts of the present local transportation problem set forth. A third class is the pleasure car builders who are engaged in commercial vehicle production in more or less earnest fashion. All told there are 80 or more manufacturers in this country engaged in commercial vehicle production in large and small ways. Of this number, a conservative estimate places the sum total of those who are really active producers at about 50.

In considering the whole question of the commercial vehicle movement, however, perhaps it is not too much to say that the production side of the equation is the less important of the two chief factors. The preponderating element in the field is the market without which production is obviously futile and which, unlike the market for pleasure cars, is not self-inductive. Selling commercial vehicles is, and for many years must continue to be, the hardest kind of labor. The actual need upon which the great and unquestionable future market is to be built exists in overwhelming and recognized strength. But the connecting link of proof that the actual vehicle of the day is economically fitted for the requirements which have given it birth remains to be forged.

What noble pioneer work already has been done and how successful it has been is not generally appreciated. As a matter of fact, a census of commercial motor vehicle service in New York City recently published places the total number of vehicles in use at not far from 800. This is exclusive of the cars employed in public cab, ambulance and fire service. In other large cities the growth has been equally constant and equally unobtrusive. So that today, were it possible to secure a total for the number of commercial cars actually in use in the United States, it would amount to really huge proportions, though of course, incomparable numerically with the total of pleasure cars in use. Yet such a total would represent but a very small fraction of the potential quantity which may be reckoned as the real market.

The point not generally appreciated in connection with the commercial motor field is that the bulk of the effort which must be put forth in its upbuilding, from now on must lie on the sales side. The pleasure end of the industry has furnished ample working material for a good foundation in design. Practical and economical vehicles now are being made for business

purposes. The real burden from now on must rest with the salesman who must work faithfully and patiently in placing the product to the best possible advantage, and in following its career with a view to perpetuating its service to the best advantage and the object of upbuilding the industry as rapidly and as thoroughly as circumstances will permit.

#### Motor Buggies a Vanishing Type.

It would seem that the death-knell of the motor buggy in its original and truly characteristic form has been sounded. The recent failure of the pioneer manufacturer in this class, though ascribed in part to high experimental costs incidental to the development of a new type of motor, lends point to a conviction which long has been growing stronger that the engine-driven buggy as such had passed the day of its great usefulness. Evidences that some of the wiser advocates of this type of vehicle had foreseen the end began to appear as far back as the Chicago show of a year ago, when several of them announced their readiness to equip their products with low wheels and pneumatic tires "optionally." Further evidence has been forthcoming during the intervening months as, one after another, its former staunch supporters have been making more or less graceful transfers of their allegiance to the field of the more standard class of machine.

At best, the high wheeled motor buggy was but a compromise; as such it was bound to be more or less unsatisfactory. Its characteristic as a carriage intended primarily to be drawn, were not wholly compatible with its characteristics as a machine intended to be propelled by its own power. From the manufacturing standpoint it presented a greater number of obstacles to successful production than any amount of theory or afterthought could begin to account for. And though several of the more persistent and wise manufacturers who sought fortune through its production developed most creditable results, all things considered, there was the incontrovertible consequence that, even under the most favorable treatment, it lacked the stability which a properly constituted motor vehicle should possess.

Its most potent asset, and the reason for its very existence, in many instances, was its educational value. Among the rural classes it served as a ready and advantageous method of introducing the motor vehicle and a

### COMING EVENTS

January 15-29, Philadelphia, Pa.—Automobile Trade Association's ninth annual show in Second Regiment armory.

January 17-22, Kansas City, Mo.—Motor Car Trade Association's show in Convention Hall.

January 24-29, Portland, Ore.—Portland Automobile Club and Dealers Association's show in Armory.

January 24-29, Detroit, Mich.—Detroit Automobile Dealers' Association's third annual show in Wayne Pavilion.

January 24-30, Washington, D. C.—Washington Automobile Dealers Association's fourth annual show in Convention Hall.

January 28-February 5, Edinburgh, Scotland—Scottish Motor Trade Association's annual show in Waverly Market.

January 29-February 5, Grand Forks, N. D.—Northwestern Implement Dealers' first annual automobile show.

February 5-6, New Orleans, La.—New Orleans Automobile Club's annual Mardi Gras speed carnival.

February 5-12, Chicago, Ill.—National Association of Automobile Manufacturers' ninth annual show in Coliseum.

February 8-14, Los Angeles, Cal.—Automobile Dealers' Association of Southern California's show in Grand avenue rink.

February 14-19, Buffalo, N. Y.—Automobile Club of Buffalo's eighth annual show in Convention Hall.

February 14-19, Hartford, Conn.—Hartford Automobile Dealers Association's third annual show in Foot Guard Armory.

February 14-19, St. Louis, Mo.—St. Louis Automobile Dealers Association's annual show in First Regiment Armory.

February 19-26, Minneapolis, Minn.—Minneapolis Automobile Show Association's exhibition in National Guard Armory.

February 19-26, Newark, N. J.—Associated Automobile Clubs of New Jersey's show in Essex Armory.

February 19-26, Salt Lake City, Utah—Automobile show in Auditorium.

February 21-26, Binghamton, N. Y.—Automobile show in State Armory.

February 21-26, Cincinnati, O.—Automobile Club of Cincinnati's annual show in Music Hall.

February 21-27, Cleveland, O.—Cleveland Automobile Dealers Association's annual show in Central Armory.

February 22-27, Milwaukee, Wis.—Milwaukee Automobile Club's second annual show in Auditorium.

February 24-March 3, Toronto, Can.—Ontario Motor League's show in St. Lawrence Arena.

February 28-March 4, Omaha, Neb.—Omaha and Council Bluffs Automobile Dealers' show.

February 28-March 5, Kansas City, Mo.—Kansas City Automobile Dealers Association's fourth annual show in Convention Hall.

March 5-12, Boston, Mass.—Boston Automobile Dealers Association's eighth annual show in Mechanics Building.

March 12-19, Syracuse, N. Y.—Syracuse Automobile Dealers Association's annual show in State Armory.

facile utensil for purposes of convincing demonstration. Hundreds of present day motorists probably would still be holding the reins over Dobbin's back were it not for the easy method of capitulation offered by the motor buggy as an intermediate step between the cart and the car. Its greatest educational feature from the industrial point of view remains to be mentioned. To numerous carriage and wagon builders throughout the country it afforded an alluring and convenient short-cut into the magnificent enterprise of automobile production. In this respect also it has served a useful purpose, as witness more than one pretentious car which has sprung from the high wheeled embryo of a year or two ago. Without in the least deprecating the gospel of the high wheel, nor questioning the desirability of the solid tire, it may not be too much to say that the motor buggy pure and simple has served its legitimate purpose and,

like an old school book, has been discarded for more advanced things demanded by the progress of events.

With no desire to put a fly in the ointment of the well meaning gentlemen who would wipe all speed limits from laws affecting automobiles and who would put their trust in the "safe and proper" provision, may we inquire whether any of them ever has walked in front of an automobile which was passing a horsedrawn vehicle going in the same direction? We have done so, and had the automobile been travelling at the rate of 25 miles per hour, instead of 15, it is exceedingly improbable that it now would be possible to pen these words of protest. The experience was sufficient to convert us on the spot to the necessity for a specified limit—and if it did not similarly convert the chauffeur, it was not because his hair failed to stand on end.

**BOREALIS' BEAMS ON QUAKER SHOW**

Opening of the First Half of Philadelphia's  
Two Weeks of Exhibition—A New  
Car is Staged.

Eclipsing in the gorgeousness of its decorations all previous efforts in the annals of local motor exhibitions, the ninth annual show of the Philadelphia (Pa.) Automobile Trade Association opened its doors at the

tations of the building, which made it impossible to assemble all the exhibits under one roof at the same time.

Taking for the basis of their decorative scheme an outdoor scene, the decorators have accomplished what is regarded as the high water mark in motor car settings in the history of Philadelphia shows. As one enters the hall the eye is greeted by an immense sunburst, or Aurora Borealis, which covers the entire wall at the further end of the building, and the rays of which alternate

which are illuminated with tiny electric lamps. Spanning the aisles at each pair of columns is a latticework, shrouded in smilax.

Attendance on the opening night was rather slim, mainly due to the snow, which was piled high in the streets after the storm of the day before. Early this week rain further contrived to shrink the gate receipts, and succeeded quite well, in connection with the doubling of the prices of admission on Tuesday, Society day. Today (Thursday)

THE SUNBURST OR AURORA BOREALIS "EFFECT" OF THE PHILADELPHIA SHOW

Third Regiment Armory in the face of unfavorable weather conditions, on Saturday night last, 15th inst., and will continue for two weeks, the final curtain falling on Saturday, 29th. It is a notable exhibition in several respects, among which is the extending of the duration of the show to double the usual period, the first time such an innovation has been introduced in this country; also it has the distinction of having two sets of exhibitors, all different, this week being given over entirely to the display of the prominent and well known makes of both the licensed and independent manufacturers. Next week these will give way to a new group of pleasure cars, as well as the commercial vehicle division, the motorcycle contingent and the accessory makers. The extension of the show period was, of course, brought about by the capacity limi-

in streamers of blue and white, the prevailing color scheme. In the centre of the sun are the figures "1910," while the rim is bordered with vari-colored lights. From the roof girders is suspended a framework covered with bunting, which also is used in the dressing of the walls. Through an ingenious combination of gas and electric light arrangement a very brilliant and effective illumination is secured, hundreds of lights being strung from the ceiling. The decorative scheme is further carried out in the promiscuous employment of wild laurel and smilax draping, and the covering of the floor in the booths with green burlap. The booths are furnished with sets of rustic furniture, also painted a rich green, in keeping with the setting. The aisles are marked off with Corinthian columns topped with ornamental representations of Swiss chalets,

the rate again will be raised to \$1. With one exception all of the cars on exhibition were uncovered at the two New York shows, the debutant being the Bergdoll.

The latter, which makes its first appearance, and is an all-Philadelphia product, of 30 horsepower rating, and generally standard proportions. It is constructed in touring, runabout and town car forms, on a single chassis, and possesses such well-known characteristics as three-quarter elliptic rear spring, shaft drive, change gear carried on the frame, and multiple disc clutch running in oil. It is made to sell at a medium price figure and is accompanied by an alluring guarantee of perpetual duration.

There were a few exhibits which were not complete when the show opened, but these were whipped into shape Sunday, and Monday saw everything in ship-shape order.

Several branches and agents who are not exhibiting are holding private displays at their salesrooms. Large crowds continually surround the revolving Thomas chassis, which is one of the features of the show. Suspended from the roof girders dangles an aeroplane, alone in its glory and towering over all, but the huge bird receives scant attention from the visitors.

The list of exhibitors for the first week follows:

#### Exhibitors.

Adamson, Prescott, Columbia and Reo.

Motor Company, Premier.  
Olds-Oakland Co., Oldsmobile and Oakland.

Packard Motor Car Co., Packard.  
Penn Motor Car Co., Mitchell.  
A. G. Spalding & Bro., Stevens-Duryea.  
W. J. Sprankle, Overland and Marion.  
Standard Motor Car Co., Middlebury and Velie.

Stoyle-Vogel Automobile Co., American.  
Stoddard-Dayton Automobile Co., Stoddard-Dayton and Courier.

Studebaker Brothers Co., Studebaker.

ing year was formally installed. Papers read at the first session were: "A Graphical Determination of Change Speed Gear Bearing Loads," by L. C. Freeman, and "The Effect of Frequent and Heavy Charging Upon Pasted Lead Peroxide Plates," by Hugh Rodman. At the second session "Some Causes of Failure of Automobile Gears" were discussed by Dr. Sargent; and the retiring president, Henry Hess, presented for consideration a broad method of classifying and preserving scientific and engineering data under the heading, "The Wider Dis-

GENERAL VIEW OF THE PHILADELPHIA SHOW

Automobile Sales Corporation, Peerless and Cadillac.

Bergdoll Motor Car Co., Bergdoll.

Chadwick Engineering Works, Chadwick.  
Ford Motor Co., Ford.

Foss-Hughes Motor Car Co., Pierce-Arrow.

G. H. Gantert, Stearns.

Gawthrop & Wister, Elmore.

General Motor Car Co., Lozier.

D. Walter Harper, Stanley.

Hills Motor Car Co., Royal Tourist.

Locomobile Company of America, Locomobile.

Longstreth Motor Car Co., Pullman and Alco.

Matheson Automobile Co., Matheson.

Maxwell-Briscoe Philadelphia Co., Maxwell.

Thomas M. Twining, Regal-Detroit.

Tioga Automobile Co., National and Hupmobile.

West-Stillman Motor Car Co., Pope-Hartford.

White Co., White.

Winton Motor Carriage Co., Winton.

#### Engineers in Annual Session.

Subdivided into two sessions, as was the case last year, the fourth annual meeting of the Society of Automobile Engineers was held on Tuesday and Thursday, 4th and 13th inst., respectively, the object of the dual program being to extend the benefits of the meeting to visiting engineers at both shows. Business and social sessions with banquet were held at the Automobile Club, and the new board of officers for the ensu-

semination of Professional Knowledge and Experience."

At the first meeting, an interesting and unscheduled subject for discussion proved to be the problem of the future disposition of the A. C. A. dynamometer, for which it is sought to develop a broader field of usefulness than yet has been obtained for it. Incidentally it was brought out that, owing to certain unforeseen characteristics, it may become necessary to alter the construction of the apparatus in such a way that the drive will be taken from cars under test directly from the hubs of the rear wheels, instead of through the wheels and tires, as in actual road service. This method, as eliminating uncertainties due to differences in tire surfaces, it is thought, will prove advantageous.

# THE AUTOMOBILE ENGINE OF THE FUTURE

Eminent Engineers Discuss the Subject and Indicate Directions in Which Possible Development Lie—  
Shortcomings of the Present Type are Realized but its Efficiency is Such  
That Progress Must be Slow and Cautious.

To the man in the street the subject of possible future developments of the automobile engine may appeal in either of two ways. He may be an owner casually interested in speculating as to whether he would have been better off had he waited before buying a new car, or he may have more or less curiosity as to whether this big little "infant industry," which is battling with the world of chance in such lusty fashion, has not pretty nearly attained its majority all unsuspected by the public at large.

The manufacturers' point of view, which is shared to some extent by the dealer as well, is entirely different. Each and every change in the design of his product is accompanied by a not inconsiderable proportion of added producing cost. If the change be a simple and natural one, the additional expense is confined to the cost of the design, the patterns, tools and special fixtures which are purely incidental to the innovation. If the new feature be of a radical character, there is added to the manufacturing "overhead," a threatening and uncertain increment of the selling cost, which is due to the delays and trials incident to educating the buyer to the advantages of the new contrivance.

A much broader and more significant aspect is lent to the question of probable changes in automobile engine construction when the present and probable future position of the industry is considered. With the limitless expansion of all transportation requirements, it is not unreasonable to suppose that the automobile is destined to figure most conspicuously in years to come. Its present utility is fairly dwarfed by visions of what the future logically may hold for it. But as its present position is largely defined by the attributes of the current type of gasoline motor, so its expansion into wider fields of usefulness must be determined to a large extent by the ability of designing engineers to produce improvements fast enough to keep pace with the demands of service.

For many uses, industrial, commercial and otherwise, the automobile ought to be superior to any other form of locomotion to give it its full ethical due. That it is not put to greater practical uses today largely is due to the fact that its mechanical attainments are not such as to warrant a more extended application. Hence, it is not too much to say that the future development of the industry at large depends to a very

great extent upon the proficiency of the automobile power plant. From which arises the question—Is the engine of today susceptible of sufficient improvement to enable the motor vehicle to tomorrow to occupy the position to which it rightfully is entitled; or will the future demand become so much more rigorous than the present as to necessitate the production of totally different types of prime mover?

It may be heartless to pursue the point further just when the industry has begun to find itself, as it were, and to move with the trained assurance which the acceptance of standardized methods alone can give. Nevertheless, there is just one chance that the not over cautious producer may allow the fulsome sound of that same substantive to act as a soporific on his business instinct; that standardization may become a species of delusion to work the undoing of the less ambitious automobile manufacturer. Indeed, it might not be amiss for some of the less wakeful ones to pay close heed to the methods of a few of their active brethren. Like the subtle Hindoo who causes the mango to take root and spring up and bear fruit all within the tick of a few seconds, they are doubly active. While their voices are upraised in exhortation upon the merits of standardization, their nimble fingers are very busy beneath the loin cloth. Sooner or later the cloth will be snapped away to disclose not the standard product at all, but a ripened one, a whole stage ahead of the expectation of the assemblage. Of other radical spirits who work in open daylight there is less to be said. But more than one of them counts a great and growing following.

So, after all, it is not unwise to inquire directly into the probable future of the automobile engine. No one possessed of a normal fund of information for a moment desires to question the fitness of the present day engine for the present day car, nor would he beg the question by intimating the conviction that automobile development would be stunted had the gasoline engine reached the climax of evolution. No one save the novice experiencing his first breakdown on a lonely highway, cares to say positively that the present automobile engine is not capable of application to a prodigiously wide field of usefulness. But with the knowledge that many earnest inquirers constantly are seeking new methods of converting the potential energy of the fuel into the kinetic energy of the turn-

ing shaft, and with the further knowledge that their activities have drawn many of them into well defined trends of thought and investigation, it becomes pertinent to inquire as to the prevailing opinion among designers as to the relative stability of the Otto type of engine as now known.

With due appreciation of the delicacy of the point raised, the Motor World approached the engineering departments of a number of the better known manufacturers with a request for information. Going to a busy class of men at a busy time, unexpected readiness to talk was experienced in more than one instance. As was anticipated, some engineers preferred to maintain the anonymity of themselves and their companies; others evinced a natural hesitation about committing themselves even to private correspondence. The general result, however, was extremely gratifying.

From such opinions as can be condensed into an article of the present scope, it will be learned that a majority of practising automobile designers have a wholesome and generous faith in the present type of engine, always postulating certain lines of improvement which in the aggregate are pretty well defined. By the present type of engine is meant that which, following the broad concept of Beau de Rochas, afterward crystalized by Dr. Otto, employs the four operations of induction, compression, ignition and expansion and exhaust in cyclic rotation. Adherence mainly appears to be to the four-stroke period for the cycle, though it is not invariably clear that the two-stroke period is not held in strong respect, while at least one worthy opinion vouches strongly for that type.

It is important to note that the opinions without exception are broadly those of engineers rather than designers or inventors simply, since the ideal objective of high efficiency in no case is subordinated to the important point that it is a question of a marketable product which is being considered. Such, indeed, were the opinions sought.

That such improvements as are destined to come about will be slow in making their appearance is the conviction expressed more than once, while at least one correspondent emphasizes the fact that urgent demands upon the industry at present forbid exhaustive study outside the direct routine of building for the market. It is a fact by no means to be deplored that the industry at large is too occupied productively to have

opportunity for extensive work of a constructive nature.

#### Prof. Kennerson's Opinion.

Something over a year ago Professor William H. Kennerson, head of the engineering department of Brown University, in the course of a lecture before the Rhode Island Motor League, propounded the idea that the present type of engine was not calculated to endure. In order to secure a more even turning moment and a more sustained impulse back of the piston, he suggested that a practical abandonment of the present style of construction would be necessary. Coming from so experienced and scientific an authority, the opinion was radical enough to cause some little comment at the time. It was used as a basis for obtaining the engineers' opinions quoted below. Within a short time the Motor World will present an article by Professor Kennerson himself, in which some of his views on the subject will be given a more extended hearing.

Those to respond to the Motor World's invitation to discuss the subject, and their views are as follows:

#### Rowlands on Gas Turbines.

D. D. Rowlands, assistant chief engineer Chalmers-Detroit Motor Co.:—"I note particularly the declaration of Professor Kennerson which you report and the fact that in the present day type of internal combustion engine there is not being realized the total amount of heat energy available.

"Of course this is a very obvious assertion and is applicable not only to the gas engine, but also to the highest type of reciprocating steam engine and also the steam turbine. For one in the days of Watt or Stevenson to have made the assertion that the present day locomotives were a possibility would have been thought little short of heresy. Also as the present day locomotive reached its high type of efficiency in operation, the greatly increased efficiency of the turbine was not thought possible. Therefore it is plainly evident that any assertion such as Professor Kennerson makes, that a new type of internal combustion engine must be developed in order to obtain the greatest amount of actual B. T. U. service, is only following up the actual course which mechanics of this character have taken from the beginning.

"No one would receive with more interest the successful working out of the gas turbine idea than the writer, and in such an age as today when science is leaping forward in such gigantic strides, it is entirely possible that the gas turbine may be successfully developed.

"So far as the Otto cycle is concerned, I will say that gas engines as they are built today, both by a great many progressive automobile manufacturers and by such concerns as the Westinghouse and Allis-Chalmers, have more than likely reached the

highest efficiency obtainable in the Otto cycle as it is known to us. Therefore, the various changes and variations in cycle practice which are being worked out and pushed by one man and another may greatly revolutionize the gas engine industry and approach more nearly the maximum point of efficiency which, no doubt, Professor Kennerson had in mind.

"There are a great many theories being presented and a great many schemes being worked upon today which are so complicated and involve so many more working parts, than the usual gas engine practice permits and are so economical that they can scarcely be considered as likely to create a very great stir in the gas engine world.

"If the automobile industry were able to catch up with itself and sit back comfortably so as to review the many little refinements and changes taking place, a great many things might be hit upon to increase the actual delivered efficiency of the motor. But when we find it necessary to work day and night in order to keep pace with things as they are now, it hardly gives us time to take very seriously Professor Kennerson's theory, interesting and true as it is."

#### Slide vs. Poppet Valves.

B. D. Gray, chief engineer American Locomotive Co.:—"A great deal of interest has been evinced in this subject recently and particularly since the Silent Knight was successfully launched by the English Daimler company, but I believe that this sudden lively interest is more or less a fad which, judging from the number of designs described and illustrated in the English trade papers, has assumed the proportions of a mania with out British friends.

"I frankly admit that the poppet valve is not ideal by any means, nor am I convinced that the slide valve is without its disadvantages.

"It might be well to analyze briefly the shortcomings of the poppet valve type of engine. Let us consider its low thermal efficiency, inadequate port area, wire drawing, noise from tappets, valves, etc., multiplicity of parts and high manufacturing cost. Theoretically and practically the slide valve engine has a higher thermal efficiency than the T head, or L-shaped poppet valve cylinder, but it is not better than a motor with the valves in the head. At most its advantage in this respect does not exceed 21-2 to 3 per cent, which is hardly worth considering in a power plant of such capacity as is commonly used in automobiles and becomes an almost infinitesimal consideration in the total cost of operation of a car.

"The slide valve lends itself admirably to large port areas, quick opening and closing and hence reduction of wire drawing, and the advantages to be derived from sustained high torque at high speed. The torque curve of the conventional motor of today is practically horizontal from 600

r. p. m. to 1400 r. p. m. and does not fall off appreciably until the safe limit of piston speed has been reached; therefore from a practical standpoint the slide valve motor possesses no distinct advantage in this respect. Theoretically the slide valve should be silent at all speeds and it is very nearly so so long as all working parts are in perfect condition. In its present commercial form, however, it is somewhat susceptible to derangement and is therefore likely not only to become noisy in a comparatively short space of time, but to be actually dangerous in the hands of an inexperienced or careless operator.

"There are thousands of poppet valve motors in operation today which run almost inaudibly and their valve mechanism is rugged, durable and automatically takes care of itself.

"As regards multiplicity of parts and manufacturing cost, the slide valve engine as it exists today seems to possess no advantage over the poppet valve type and on the whole it is difficult to comprehend that its advocates should hope to see it supercede our old time friend.

"As I have heretofore intimated, the internal combustion motor is susceptible to improvement, particularly in the line of simplicity of design and thermal efficiency, and this is being accomplished experimentally. One motor I have in mind, 4 1/2 by 5 inches, has extremely few working parts and has already shown a thermal efficiency of 34 per cent. It is safe to say, therefore, that there is room for development along these lines, but such development must necessarily be slow and the improvements will come gradually. The purchaser of a modern car today need entertain no fears that his motor will become obsolete and must therefore be consigned to the scrap heap before the end of its natural life."

#### Two Cycle and Air Cooling.

Charles E. Duryea, Reading, Pa.:—"I think my attitude is best shown by my actions. I showed a rotary valve, four cycle engine at the Automobile Show in New York three years ago. This offers better valve action, in that it opens and closes more quickly than the usual poppet valve and is not noisy and the action is continuous instead of reciprocating. It therefore is less susceptible to wear. It seems to me to be a reduction of the four cycle engine to its simplest terms.

"Since then I have been working on air cooled engines of the two cycle type and am marketing a very light efficient engine of this kind. I do not see any future type that promises to come into use. The advance would seem to necessarily come from betterments and refinements of the present type. This the Knight has shown to be possible and my rotary showed a different and simpler way. But both of these are water cooled. I believe that the future small automobile engine, i. e., the one that will interest the masses, will be air cooled.

Air cooling not only gets rid of the complication and cost of water cooling equipment, but it wipes out at one swoop the care which a water system demands. Few users of a satisfactory air cooling system will ever go to a water cooled one, but the tendency the other way seems to me very strong.

"The four cycle is not well adapted to air cooling. Its valves must be at the head end and so are exposed to all the heat there is. They must have pockets and these tend to make the cylinder warp out of cylinder truth. This is true to some extent even when the valves are in the heads. The two cycle does not have these troubles and so is better adapted to air cooling than the four. I know this is contrary to common opinion, but I believe it is capable of demonstration. The reason seems to be that while the two cycle fires twice as often, its charges are not quite so large and it holds the hot gases at about 120 degrees, whereas the four cycle engine fires charges of practically piston displacement volume and holds the hot gases at 360 degrees. The cylinder head and walls are cylindrical and can be machined inside and out to an even thickness conducive to symmetrical expansion and consequent perfect fit of rings, no matter whether hot or cold. It is my belief that what will finally come is not so much a new type of engine as a fitting of the old type to the new needs. This will really be a new engine, but not a new type.

"In the early days we had stationery engines fitted to the chassis and sold for automobile work. The early Winton, Packard and Benz cars were of this type. They ran and gave service, but they were not right for automobile use. Benz was even ahead of Daimler, but gets little credit because Daimler was the man who saw the problem correctly and built light engines suited to it. I believe that not only the large heavy single cylinder is unsuited, but that the poppet valve will also go, because unsuited to the exposure to heat which it gets in the present engine. I believe that the two cycle will be modified to a considerable extent and, while retaining the present simplicity, will be made to do automobile work in a manner suitable to the requirements and better than the four cycle does it at present. The performance of two cycle engines now in use shows plainly that this can be done.

"The public is proverbially slow at taking new things, simply because the makers do not offer them. The complex almost always precedes the simple. As the public gets ideas of its own on the subject it will demand the simpler. The work you seem to be doing will help the progress of the business."

#### Coler on Concentric Pistons.

Ernest Coler, Maxwell-Briscoe Motor Co.:

"Though Professor Kennerson's criticism is rather sweeping it contains much that is true and we have no doubt that the profes-

sor's hope will be realized, at least in part.

"In our opinion the concentric-piston idea constitutes a step in the desired direction, especially when the idea is utilized in double-acting motors, in which, under proper conditions, there will be a purer mixture on account of more perfect scavenging; an expansion speed greater than that of the piston alone; an expansion to lower limits, with consequent lower exhaust pressure; a maximum volume with minimum wall surface.

"A motor that fulfills these conditions would be nearly ideal, while the present-day constructions, efficient though they be, when measured by the standard of our achievements, are merely compromises. Naturally the process of development will be slow and the ideal gas engine will not be produced at one stroke of some genius, but by consistent improvement."

#### Possible Power Increases.

David Ferguson, chief engineer, Pierce-Arrow Motor Car Co.:

"The present type of four-cycle engine is a pretty good piece of mechanism, and whether it will be changed radically in the next few years is open to question. Of course, we are improving it a little every year and there is large scope for further improvement along the line of greater power for the same piston displacement, and greater economy. This may be attained by liquid fuel injection, admitting of much higher compression, or it may be attained by forcing in the charge on what is at present the suction stroke, or it may be attained by more complete scavenging at the end of the exhaust stroke. We have reached a stage in the gasoline engine development when radical improvements will come slowly.

"As far as fitness for its duty goes it could be made better by having the maximum pressure in the cylinder sustained for a long period of the stroke. If this could be accomplished as in the steam engine, we could almost dispense with the change speed gear, and the control of the car would be very simple."

#### Eight Cylinders Probable.

Edwin R. Hewitt, president Hewitt Motor Co.:

"My opinion is that the gas engine of the Otto type is the correct one for small engine purposes. This opinion is based on the fact that it is possible with proper construction to make engines which develop in the cylinder all the heat which the walls, valve ports and pistons can look after; in other words, the capacity of the engines is limited by their heat radiating power.

"The trend of improvement in the motors is entirely in the line of more efficient valve motion and the admission and exhaust of proper quantities of fuel at the speeds desired and looking after the heat.

"It has been found with the engines in use that we cannot use the highest compres-

sion possible owing to our not being able to look after the heat properly. In other words, the engine is already up to its limit at certain speeds, and under certain conditions, and it is the improvements of these conditions that the engineer must study.

"The size of cylinders is usually smaller than it was a few years ago. This is largely on account of the heat generated in the large cylinders, as well as the mechanical strains involved. The future will see four-cylinder engines used up to about 50 horsepower, or  $4\frac{1}{2}$  bore. Above that the engines will have more cylinders, either six or eight, as required. The eight-cylinder engine being a cheaper engine to manufacture than the six for the same power, will rapidly come into use for large powers. Up to 50 horse-power there is no advantage in engines with more than four cylinders."

#### Look at the Locomotive.

One of the engineers representing an old and widely known company, who did not desire his name used, writes:

"The subject of a new type of internal combustion engine, while interesting from a theoretical standpoint, would have to be demonstrated in a practical way to be superior to the present type of four-cycle, or Otto engine, before it would be of commercial value. I believe that the future will bring forth developments along different lines, yet the practical side of such a motor must be as simple and reliable as the present type before it can be considered as a commercial proposition. I doubt very much whether any other cycle can be developed that will give a much higher efficiency than the Otto cycle does at the present time without the introduction of complications, which will mitigate against the reliability of such a gain in efficiency.

"For instance, a steam locomotive is not built in the most efficient manner for the service it is called on to perform, yet in the past fifty years there have been very slight changes made in its general design. I, therefore, feel that the present form of internal combustion motor will follow along the same lines as the steam locomotive, and that for reliability, general efficiency and simplicity it will be very hard to improve upon."

#### Why Change Will be Slow.

Another engineer, similarly situated, expressed this opinion:

"Any new type of motor, no matter how seemingly successful it may be just now, will require years of development to put it in the same state as the present four-cycle motor, taking everything into consideration, reliability, life, wear, flexibility, etc. Without question, the present motor has limitations. We believe it is developed to quite a thorough extent to-day, and further development will be pretty slow with the standard type of motor, and yet we think it will continue to be principally used for quite a long time."

REPRESENTATIVE AMERICAN AUTOMOBILE FACTORIES

## SHOCKS SUSTAINED BY WHEELS

**Much More Distinctive Than are Commonly Supposed—Facts Brought Out by Spring Wheel Experiments.**

Although the spring wheel has not made great headway in this country it is highly regarded by many British motorists and in England enjoys considerable use. One advantage incidental to its development which alone ought to sanction its construction in the eyes even of those who are not wholly in sympathy with its principle, is that its design offers peculiarly advantageous opportunities for studying the problem of automobile suspension in all its phases. Illustrative of this fact, the lecture of Hon. R. Clare Parsons, M. A., recently read before the Royal Society of Arts, develops some new and interesting information in regard to the degree of shock which must be borne by the wheels of a vehicle when encountering obstacles on the road. It also shows the degree of success which has been obtained with the Panflex as compared with the ordinary solid wheel.

"It is clear that, in order to replace the air spring of the pneumatic tire most efficiently, not only should the rim be as light as possible, but also the resilient medium should be situated as near the rim as practicable, and not in the hub as has been suggested by numerous inventors," says Mr. Parsons.

"It was, therefore, considered necessary to make the center of the wheel absolutely independent of the rim. In addition it was deemed desirable that it should roll freely inside the rim, without any means of attachment between the two, thus differing from many forms of spring wheel that have been proposed.

"In order to carry this principle into effect, it was found necessary to attach the resilient material rigidly, in the form of independent members, either to the outer rim, or to the wheel center, and to allow their other extremities to bear respectively against the wheel center or on the rim; they being kept in position sideways by circular flanges attached either to the wheel center or the outer rim.

"Whichever method is adopted, the wheel center will rotate slightly more rapidly than the rim, and this difference of the number of revolutions, termed the 'creep,' is allowed to take place without hindrance of any kind."

In order to settle generally many points as to the best design of wheel, it was decided to carry out some careful investigations with model wheels about 12 inches diameter. The apparatus employed for the laboratory tests consisted of an ordinary bicycle wheel mounted in its frame with crank and chain complete, the tread of the wheel being fitted with a plain wood rim

which was covered with a strip of canvas. The experimental wheel was mounted above this wheel in such a way that pressure could be applied to its axle, springs being interposed to represent the ordinary suspension of a road vehicle. The rim of the bicycle wheel thus represented the highway surface, while the experimental wheel took the place of the wheel of a moving vehicle. A large paper disc was attached to the side of the bicycle wheel, while a pencil carried

Fig. 1

on the framework supporting the experimental wheel, by making a tracing on the disc served to indicate the vertical travel of the second wheel over the first, thus affording a graphic record of the performance of the device under test.

When the bicycle wheel was rotated at any required speed and an obstacle interposed between the two wheels a jolt took

Fig. 2

place the magnitude and intensity of which could afterward be calculated by means of the diagram and certain known data. With this apparatus three sets of tests were carried out; one with an ordinary wheel having a solid tire; another with a solid tired wheel in which blocks of rubber were interposed between the outer rim and a special inner one; and the third in which steel springs were substituted for the rubber blocks employed in the second test. The lecturer continues:

"An attempt was also made to fit a pneu-

matic tire to the model wheel, but the results obtained were not reliable owing to its small diameter. Numerous diagrams of the dynamic jolt were taken with this apparatus, some of which are shown in Figs. 1 and 2.

"These give records taken from two model wheels, one fitted with a solid rubber tire on a rigid wheel, and the other with a solid rubber tire with springs between it and the wheel center.

"The circular line shows the path marked by a pencil when the experimental wheel was revolving upon the smooth rim of the bicycle wheel, and the sudden jump which is given by this line indicates the extent to which the axle was lifted in passing over the obstacle when moving at the speed indicated, whilst the dotted line shows the movement of the axle when the wheel was rolled slowly over the obstacle. In each case the obstacle was  $\frac{3}{8}$  inch in height.

"In the case of the rigid wheel (Fig. 1) it is seen that the momentum of the mass of the wheel lifts the axle to a height approximately double that of the obstacle over which it is passing.

"Another point to be observed is the extreme suddenness of the jump; the whole of the upward movement taking place in the length represented by two of the radial spaces.

"Referring to the similar records for the spring wheel (Fig. 2), the effect of the springs is very clearly shown, since the movement of the axle does not now exceed the height of the obstacle, and in addition the distance occupied by the jolt is increased by at least 50 per cent. The wheel, therefore, in passing over the obstacle does only one-half the work, and does it in one and a half times the time, consequently the intensity of the movement is reduced to one third.

"This is more clearly shown in the diagram in Fig. 3, where the horizontal scale represents time instead of distance. Here it is seen that with the rigid wheel the maximum height is reached a little after .01 second, whilst with the spring wheel this period is lengthened to about .02 second. On the same diagram is plotted the accelerating force necessary to produce the given movement in the given time, and it is seen that with the rigid wheel this force, which is a measure of the intensity of the jolt, amounts to at least twice as much as that of the spring wheel.

"It is clear from these diagrams that the effect of interposing a resilient medium between the rim, having a solid rubber tire, and the wheel center, produced a very marked effect in reducing the suddenness of the jolts imparted to the axle, and also to the body of the vehicle, by lengthening the time in which the jolt takes place.

"Noteworthy among the points revealed by these experiments is the extreme suddenness of the movement of the wheel and the consequent intensity of the forces to

which it is subjected, and it is seen that in no case does the total duration of the movement exceed .04 second, and that the total lift of the wheel is effected in only a fraction of that time.

"Considering first the diagram for the rigid wheel, a lift of about  $\frac{3}{4}$  inch is effected in little over .01 second, this distance being 30 or 40 times as great as that through which a body falling freely from rest would pass in the same time.

"A detailed examination of the curve described by the axis of the wheel shows, however, an intensity of force acting for a short period far exceeding this, and although the apparatus employed cannot be relied upon for extreme accuracy in the investigation of periods of time measured by thousandths of a second, yet it is clear that the instantaneous force to which the wheel is subjected at the moment of striking the obstacle must be somewhere near 1,000 times as great as the force of gravitation.

"Analizing the curve for the spring wheel in a similar manner, it is found that by the action of the spring the lift is reduced to .4 inch in .025 second, or about 10 times the natural fall in the same time, whilst the intensity of the instantaneous force is reduced to less than 500 times that of gravitation.

"A further point worthy of note is that the violence of the jolt is less at a high speed than at a low one, a fact which is not only shown by the diagram, and borne out by the personal opinion of those who have had experience of the running of full-sized wheels, but has also been confirmed by records taken on a seismograph attached to a vehicle fitted alternately with pneumatic tires and spring wheels and driven over the same road."

Later it was deemed advisable to continue the experiments by means of full sized wheels and various experimental wheels were constructed for use upon a 12 horsepower car of local make. The lecturer continues in regard to the further trials:

"The rims of these wheels were 24 inches in diameter, of a channel section with deep internal side flanges, and as ease of manufacture was important they were constructed temporarily in aluminum, the outer circumference being provided with two dove-tailed grooves to receive the solid rubber bands similar to those such as are used for carriage wheels.

"The inner surfaces of these channels for the leading wheels were cast smooth, and those for the driving wheels with transverse corrugations in the bottom of the channels; the inner surfaces of the flanges of both the leading and driven rims being turned smooth.

"Various forms of rubber blocks were tried as resilient members between the rim and wheel center, and although in the leading wheels the results were fairly satisfactory, it was found that in the driving wheels the rubber could not be made to resist the

tractive force, but after much time had been devoted to the investigation the prospects of success were so small that spiral steel springs with rubber pads attached to their free ends, and capable of movement in every direction, were substituted for the rubber blocks.

"This form of spring member was, in the first instance, tested in the model wheel here shown, and was found to give results superior to those obtained from the rubber blocks.

"At this stage of the investigation, the question of wear and tear in the moving parts of the resilient members within the wheel, which has caused so much difficulty to inventors, required the most careful consideration.

"The impossibility in practice of keeping mud and dust from entering amongst

would possess the advantage over the outside walk, in that less mud would reach the rubber pads on the free ends of the springs, which it was thought might possibly lead to excessive wear and tear.

"To settle this question, sample wheels on both principles were constructed for the 12 horsepower motor car and thoroughly tested by running them on roads with surfaces in the worst condition and in all weathers. Contrary to expectation, it was discovered that even in wet weather comparatively little mud entered the channel rim in the case of the outside walk, and further, that practically no wear and tear of the rubber pads of the channel rim was visible in either form. Both types of wheel worked well, but as it was found that, from a structural point of view, the outside walk was preferable to the inside walk in many ways, this principle was adopted, and the inside walk abandoned."

#### Motor Cars for Tombstone Salesmen.

Motor cars especially constructed for the uses of undertakers and funeral directors, for several years have been the subject of jests at the hands of such as love to point out the seeming incongruities of daily life. But it remained for the Monumental News in serious vein to indicate the great benefits which the pleasure car has wrought for the manufacturers of and dealers in monuments. According to that authority, no less than 125 tombstone salesmen in various parts of the country are now employing the motor car for their regular work, and find it an economical accessory in business.

The uses to which the cars are put by their owners range from canvassing the surrounding territory, taking customers to the cemetery or "joy riding" prospects, to carrying tools or markers or even dies to the cemetery. In only one known instance has the use of a car been given up after fair trial. In that case an objection was raised by the rural constituents who thought they were paying for gasoline and tires along with the memorials to their dear departed. In other sections, however, it is recognized that the automobile is a positive factor of economy in this, as in any other business, and in consequence, it is looked upon with no small favor by the owners and their customers alike.

#### Acetylene Burner Design Troublesome.

Considerable difficulty has been experienced in the design of acetylene burners intended for automobile lighting purposes. Under certain conditions a burner which will work satisfactorily with a full head of gas will carbonize if the gas is turned low. The problem of admitting sufficient air to the gas to secure perfect combustion has been likened in its difficult nature to the carburettor problem by one expert. Actual evidence that such a difficulty exists is found in the number of different types of burner now on the market.

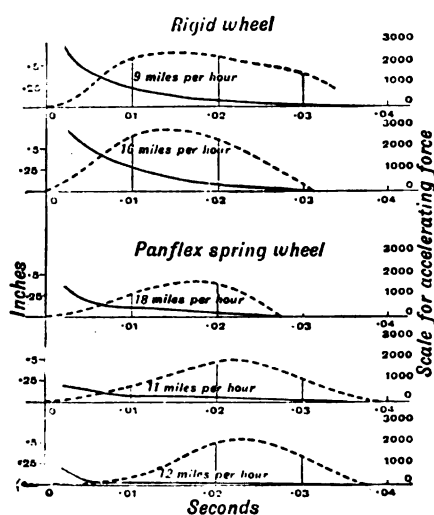

Fig. 3

the working parts was very evident, and therefore arose the absolute necessity of making those parts capable of resisting the consequent grinding action.

"Having had much experience with machinery of various kinds where damage caused by mud and sand had to be provided against, it was fully realized that in a resilient wheel the fundamental principle to be observed was that no metal rubbing surfaces were admissible, and further that rubbing surfaces of any kind should be reduced to a minimum.

"Thus the important question which I have already referred to had to be again considered, namely, as to whether it was preferable that the spiral springs should be rigidly attached to the outer rim, and the rubber pads on their free ends bear upon the wheel center, which would be fitted with the required side plates, a mode of construction which may be termed the inside walk principle; or whether the springs should be rigidly attached to the wheel center, and the pads on the free ends bear against the bottom of the channel of the outer rim; this may be termed the outside walk principle.

"It was thought that the inside walk

## NEW MARKET FOR AUTOMOBILES

**Horse Diseases Helping Them in East Africa—Consul Criticizes Export Methods of American Manufacturers.**

Portuguese East Africa certainly has not appeared heretofore in the guise of a promising market for automobiles. The deep sand of the whole colony seemed to mock at all the different kinds of transportation by wheels and formed a veritable curse to the country. Horses died shortly after importation of a mysterious disease, from which only 2 per cent. of the stricken recover. Cattle diseases were just as bad, and as a result, Portuguese East Africa was practically transportationless. But modern invention has even conquered this unpromising field, for where the horse and ox will balk, sicken and die, the motor car simply gives an extra heavy "cough" and forces its way through sand and over the veldt. As Consul George A. Chamberlain, of Lourenco Marquez, explains in his last report to the State Department:

"The situation resolved itself into a choice between donkeys and automobiles, and the latter are winning."

To the American manufacturer, who is accustomed to deal with "five hundred cars of Model X," or some similar big order, the report of the American consul in the Portuguese colony may seem to be dealing with mere bagatelles; but to the people of Lourenco Marquez the fact that automobiles have actually appeared upon its streets is of the highest importance.

Consul Chamberlain states that:

"Of the motor cars already here, one is of American make and would cost at home about \$750, but so strangely do our manufacturers arrange their export business that the middleman's commissions and duties brought up the cost of the car to the local purchaser to about \$1,400.

"During the present month (November, 1909) four motor cars have made their appearance on the streets of Lourenco Marquez, and a lorry of very special construction is on the way to start the battle against the 18-inch sand of the suburbs.

"The lorry was ordered by the local government from a European firm. The contract is most interesting. The purchase price is fixed at about \$15,000, to be paid in three instalments, as the car succeeds in performing the various feats of the guaranty. This guaranty assures, among other things, a carrying capacity of 4 tons through 18-inch sand at 8 miles an hour, a hauling capacity of 8 tons, and the performing of a trip under test conditions to the suburb of Marraquene, 19 miles out of Lourenco Marquez.

"There is a limited market here for a cheap grade of car suitable for running around town. Four have come in this

month, and it is safe to predict that next year will see this number increased by 20. The market for traction, freight, and agricultural cars, if properly worked, is unlimited. Horse sickness and tick fevers will prove unfailing allies to the manufacturer."

Not only the possibilities of trade in the Portuguese colony, but also the sales methods of American manufacturers undergo a critical examination and discussion in the consul's report, which concludes:

"Some American automobile manufacturers have seen fit to sell their entire export business to New York commission houses. The manufacturer reasons thus: It costs him \$800 to turn out his car. A big commission house agrees to give him \$1,000 per car if it be made sole export agent. He thus makes a solid profit and is free from the trouble of studying export and founding an export department. He signs a contract and thinks he has made a successful deal, but that contract is to a large degree the destruction of his export business. The commission house takes over the car at \$1,000, and contracts agencies with established firms all over the world, fixing the retail price at \$1,500. The agency gets a net sum of \$75 per car sold. Charges, insurance, freight, and duties, say, \$225. The commission house pockets the difference, \$200, just what the manufacturer made on his car.

"Anyone can see the dire effects such a line of procedure will have upon American competition abroad. Our medium-priced cars are wonderfully suited for the capture of new markets if they can be sold as medium-priced cars. The only way to assure this is by the establishment of direct limited agencies and undertaking the local advertising. The latter stipulation is unusual, but most important. In the first place, the American conception of advertising is just sifting into the outer world. In the second place, a foreign agent is interested in American goods solely through his pocket. He is swamped with agencies for things that would sell with a little pushing.

"Unlimited agencies are a purely American invention which has entrapped many a careless firm. From a business point of view they are often disastrous. The other day one of our most solid and famous manufacturing firms (not of automobiles) conceded to one man the agency 'for territory south of the equator' for a new line of manufacture they were just taking up on a large scale."

### Motor Buses Bring Lower Rates.

Staunch supporters of a "horseless age" to come should take courage from an incident in connection with the huge daily ebb and flow of London's enormous stream of traffic. Due to the competition of the London General Omnibus Co., the Great Eastern Railway has been forced to cut its passenger rates on the riverside lines from Fenchurch street to the suburbs Blackwell and Woolwich.

## OPPORTUNITIES IN SOUTH AFRICA

**Demand Keen in Mining District and American Cars Finding Favor—But Makers' Methods Curtail Trade.**

Encouraging news comes from Johannesburg, South Africa, where Consul Edwin N. Gunsaulus represents American interests, and who says that automobile manufacturers hitherto have found South Africa a rather barren field for their products, mainly on account of the prejudice created in that country against American motor cars, by a shipment of cheap and highly unsatisfactory cars, which were dumped upon the South African market a few years ago. Ever since energetic and reputable manufacturers have endeavored to reclaim the lost territory, and at present are able to say they have succeeded.

An obstacle still confronting them, and one which is the cause of many lost opportunities, is discussed by Consul Gunsaulus and thus referred to in his report to the State Department:

"Owing to the advanced price over and above the usual commission and freight charges charged for the machines above referred to by the American house through which they are bought, and which virtually controls this market for these cars, the cost of the landed article is so high that in order to compete with cheap European makes, which are freely sold here, the dealer realizes a very small profit, and is thus not encouraged to push the American trade as much as he would under more favorable conditions. This, it seems to me, is a point which the manufacturer should not overlook, inasmuch as the interests of the local dealers, who are expected to effect the sales, should be protected as much as possible."

By far the greater portion of the 1,000 motor vehicles in Johannesburg and the Reef district are in the hands of the numerous mining companies and firms engaged in selling mining machinery and supplies, the principals and employees of these concerns finding the cars practically indispensable in their trips through the mining district, which extends for a distance of 20 to 30 miles on either side of the city.

As is but natural in such commercial surroundings "the cars probably most in demand in this market are those ranging in price from \$1,250 to \$2,500, delivered here, the average price of those now in use and for which there is the greatest sale being about \$1,500. The American made cars which have found considerable favor in Johannesburg recently, and in which a good trade has been done, range in price from \$1,375 to \$1,600, delivered here, the prices being dependent, of course, upon the accessories purchased, such as lamps, hoods, horns, etc.

"The motor cars in use in Johannesburg

and vicinity, which constitutes a larger market than all of the rest of South Africa combined, are of various grades of French, German, English and American make, with a few of Italian production. The highest-priced cars in use here are of English and Continental manufacture, and the prices vary from \$5,500 to \$10,000, delivered in Johannesburg. While there are many high-priced cars owned in Johannesburg, and there is a fair market for machines of this class, these are mostly ordered especially by or for the parties desiring them, and are not, as a rule, kept in stock by local dealers.

The duty on automobiles is 15 per cent. of the value, with a 3 per cent. preference in favor of those manufactured in the United Kingdom and reciprocating British colonies."

In regard to the types most frequently seen in Johannesburg, Mr. Gunsaulus gives some very interesting information. He calls particular attention to the fact that in South Africa the "types of motor cars in most popular demand are those ranging from 16 to 20 or 20 to 28 horsepower, with seating capacity for from three to five persons. There is also a good demand for cars of the runabout class. As the climate is, for the most part, very dry, wood, if used in any part of the car, must be well seasoned. There has been considerable difficulty with wooden wheels made of material not well seasoned. Aluminum is advisable for bodies where possible. Bad roads are the rule outside the centers of the cities and towns, and as a great many small streams are encountered a high clearance is recommended. Many of the cars sent here have a clearance of only six to eight inches, which is not sufficient in crossing streams abounding in small stones or in running over roads where the wheels of wagons or other vehicles have made deep ruts.

"It is also to be recommended to a majority of makers that their springs be made heavier. Cars coming to this country should have at least one more leaf than is ordinarily found comprising the springs of machines sent here. This would be a distinct point in favor of a car, as in most cases the owner makes this addition after purchase. Another suggestion might be made as to axles, many of which show a tendency to bend in going over rough roads after being in use a short time. Some manufacturers will find it advantageous to reinforce the front axle with some sort of truss.

"Another point to be borne in mind is that a good quality of paint should be used. In this climate, where it is very hot and dry during certain parts of the year, paint that is of poor quality rapidly deteriorates, and the car thus painted presents a very shabby appearance within two or three months. Paint on other cars will last and look well for a year without even revarnishing. It is obvious, therefore, that the exercise of care in this particular is a point well worth considering."

## NEW MOUNT FOR SHOCK ABSORBERS

Placing Them Transversely Instead of at the Sides Claimed to Present Advantages—Arresting Side Strain.

It is commonly supposed that the complete and entire purpose of the shock absorber is to ameliorate the plunging and rebounding effects which would be suffered by the ordinary spring suspension unassisted by some such device. That the shock absorber principle is capable of extension to a broader and even more general application is illustrated in the case of the Marmon "Thirty-Two" cars, whose makers, Nordyke & Marmon Co., Indianapolis, Ind.,

MOUNTING OF MARMON'S ABSORBERS

have adopted a novel method of attachment with this idea in view.

Instead of being mounted parallel with the principal spring members—that is to say, fore and aft of the car, as customarily is done—the shock absorbers are carried on special fittings transversely of the chassis. It is claimed that this method of attaching the rear shock absorbers tends, among other things, to minimize the effects of side strain upon the springs. It also renders the devices more accessible, relieves them from any possible interference from springs or fenders and gives them full freedom of action.

The method of attachment also is particularly advantageous to the action of the shock absorbers themselves. The upper portion is secured by means of strong steel brackets bolted to the main frame, while the lower portion is attached to an arm extending from and integral with the lower half of the spring saddle bearing. The nature of the arrangement is made plain by the illustration, which also reveals the outlines of the original form of live rear axle employed on this Marmon model, and which also carries the change gear mechanism.

### Rubber Aids to Ignition Efficiency.

Since rubber plays a big part as an insulator in high tension ignition systems for motor cars, the manufacture of second-

ary wire and of hard rubber conduits for wires carrying high tension current not unnaturally falls in the domain of the rubber manufacturers, of whom the Diamond Rubber Co., of Akron, O., was among the early ones in taking up this special field in addition to their more generally known products. A complete line of Diamond igniter cables is made. The copper strands are insulated with a substantial and resistant rubber compound over which suitable glazed braiding is provided for the purposes of protecting the rubber insulation from abrasion and other outside attack. Handsome appearance is given the cable by the braiding also, by the mingling of colored threads in design patterns. It is claimed that in the manufacture of secondary cable of this character a thorough knowledge of correct rubber chemistry is required, an equipment on which the Diamond experts obviously are not lacking. A more recent Diamond contribution to the ignition specialty line is the "igniter bar," which has made its appearance on several new models recently. It is made to convey high tension wires from the coil to the plugs, each wire being perfectly insulated in the bar and no further insulation being necessary. The wires, being gathered in one conduit in this way, are not in loose array over the engine. The bars are made to specifications, according to the engine on which they are to be used, so that the total length and the outlets for the different wires accord with the motor dimensions and construction.

### One Cause of Magneto Trouble.

An illusive and mysterious cause of irregular magneto action which sometimes may come to light in instruments which have been in use for a long time arises from excessive end play in the armature bearings. Where such is the case, the end motion of the armature may be sufficient to upset the action of the contact breaker and render the time of firing uncertain and irregular. Inserting a fiber washer to take up the slack is a sufficient remedy for the evil in most instances.

### Putting It up to the Garage Keeper.

The city council of Augusta, Ga., is wrestling with an ordinance requiring garage owners to furnish bonds in the sum of \$5,000 for the safety of automobiles stored with them and imposing a fine for renting stored cars or otherwise permitting cars to be removed without the consent of the owners. Action on this ordinance is pending but one requiring owners to pay a registration fee of \$5 already has been passed.

### Lubricant that Resists Zero Weather.

According to a machinery expert, a lubricant which will not stiffen in cold weather may be made by mixing graphite with cylinder oil until they become of a pasty consistency and then adding kerosene until it flows freely. The resulting oil, he declares, will not stiffen at 14 degrees below zero.

## FACILITATING MAGNETO TIMING

**Tell-Tale Lamp Devised to Serve the Purpose—How It is Applied and How It Operates.**

For purposes of accuracy and celerity in magneto setting, a British manufacturer of ignition specialties has produced a small tell-tale lamp especially adapted to be used when timing the magneto and so contrived as to render that operation much more rapid and certain than is possible by the ordinary methods of procedure. The lamp itself is of four-volt capacity and is mounted in a small wooden case in which it is thoroughly protected and through the open top of which its light may be seen. A double insulated conductor cable is used to connect the device with an ordinary ignition accumulator, while a third wire is led to the contact breaker of the magneto which it is desired to time. A metallic foot on the device enables it to be "grounded" on some part of the motor while the operation is in progress.

When it is to be used, a sheet of paper is slipped beneath the carbon contact of the contact breaker to prevent the primary current from being grounded through the armature. The armature is then rotated slowly. Whenever the points of the contact breaker come together, the light will glow; but as soon as they are separated the light will be extinguished. This circumstance furnishes a simple and accurate method of determining the exact instant of separation of the points and is claimed to be much more accurate than that whereby the point of interruption is determined by mere inspection of the contact breaker alone.

### Demountable Rim for Twin Pneumatics.

Because of the growing use of pneumatic tires for commercial vehicle service, a dual demountable rim for twin pneumatics has been brought out by the Continental Caoutchouc Co., of New York City. The demountable feature permits quick tire changes when trouble occurs, as new tires already inflated on spare rims may be substituted for those that are deflated or injured. As shown in the accompanying illustration, the tires are placed side by side so that they share the burden which the rear wheels of commercial vehicles have to stand. The regular equipment for the rim is the Continental type course tire or the steel studded, non-skid type, but any style of clincher tire may be fitted. Twin type pneumatics have become a standard feature of not a few makes of commercial vehicle for even heavy service, for the reason that in addition to easing the jar or vibration which might in some cases injure fragile goods that are being carried, the lessening of the vibration on the vehicle itself results

in a decided reduction in repair and maintenance expense occasioned by the jar on the mechanism. The new Continental dual type demountable rim provides a method

of using twin pneumatics with a minimum of difficulty.

### Alarm Watch for Night Use.

Telling time by the stars may be an easy accomplishment for astronomers and mariners, but the average motorist while on the road has little time for star gazing, even of the purposeful sort. Hence, Miller—Charles E. Miller—of New York City, and eight other localities, has imported a very recent European innovation in

the new radium illuminated dial alarm watch. With the constancy of the heavenly bodies, but entirely unaffected by cloudy weather conditions, the bits of real refulgent radium which are inlaid in the dial hour marks and in narrow stripes running down the hands, emit scintillations which enable the time to be read off with ease at any hour of the darkest night. For the benefit of those who are near-sighted, presumably, there is added an alarm attachment which may be set for any time. The special brass dashboard mounting case which is furnished when the watch is desired for automobile use has a plug lock to prevent theft.

## SINGLE JET CARBURETTOR DOOMED

**So Says English Engineer in Discussing the Subject—Grounds upon Which He Bases His Opinion.**

Carburettor design just at present is widely segregated, owing to the existence of two entirely different theories of action—one demanding the use of two or more jets with their accompanying mixing chambers and suitable throttling means, and the other the more familiar automatic extra air valve. In the minds of many engineers the conviction is firmly established that in order to supply a mixture of constant quality to the engine it is necessary only to add to the simple jet and mixing chamber a means of supplying additional air in response to the demands of increased suction. Others, on the other hand, are equally firm in the belief that even approximately constant mixtures can be obtained only by the use of two or more jets acting singly or in multiple. Of the latter class is a British engineer whose views on the subject are presented by the Autocar.

"In the opinion of many well qualified to give an opinion, the automatic valve will soon be obsolete, and the reason of its extinction is well worth some consideration," he remarks. "It is one of the many requirements of the present day motorist that his car shall pull strongly and evenly when running on the top gear at five or six miles per hour—say with a gear of  $3\frac{1}{4}$  to 1 on the direct drive with an engine of about 18 to 20 h.p. Now, to obtain efficiency of this kind, a two-jet carburettor is, in the writer's opinion, practically essential. In this type of carburettor the main jet is entirely out of use when the engine is running slowly, the feed being from a small jet which is surrounded by a very small choke tube, there being perhaps an annular space round the jet of about  $\frac{1}{4}$  inch. Considering the engine as an air pump, it will be seen that it is taking the whole of its supply from this very small opening, consequently the velocity of the air past the jet, even when the engine is only just turning round, is very great, and the petrol is violently sprayed, giving a rich, well-mixed gas, and enabling the engine to give off considerable power when turning round slowly.

"In the ordinary single jet carburettor, the throttle is usually placed some little distance above the jet, and it will be readily understood that when the throttle is only slightly open, the rush of air past the jet surrounded by its large choke tube is comparatively feeble, and probably the petrol comes out of the jet very slowly, being drawn up into the induction pipe through evaporation. Unless the throttle is opened wider to allow a stronger suction to pass the jet, not much power can be obtained, for the mixture is weak, and staggering takes place.

"Now with a single-jet carburetter to obtain better results, the main choke tube must be restricted. This, of course, gives improved running at slow speeds, but at high speeds the power soon begins to fall off, owing to the lack of volume, and it is at that point an automatic valve should act to supply the greater volume required; but it is manifest that if it does act, an indication is given that the vacuum or throttling effect is greatest when it is least wanted, and a greater vacuum exists at high speeds than at low; consequently when running very slowly, the vacuum is insufficient. A negative pressure is, of course, essential, otherwise petrol would not leave the jet, but as any vacuum or negative pressure represents a throttle on the engine, it is only desirable when maximum quantities of gas are not required. It is essential to have an abnormally strong vacuum in the induction pipe when very slow running is to be obtained—a greater vacuum than when the engine is running very fast—consequently it will be seen that an automatic valve which would open when the engine was running fast would also open when it was running slowly, and so defeat its object.

"Further, it will be seen that if an automatic valve be fitted on a two-jet carburetter, it must be below the throttle on the small jet, and above the throttle on the large jet, but it is a well known fact, although somewhat a curious one, that the two openings past the large and small jets on some two-jet carburetters can be so graded as to give such good results that the adoption of a hand operated air valve fails to give any appreciable increased efficiency. This mainly applies to carburetters of that type which feed the engine from both jets at full power. In these carburetters when running very slowly the main throttle is shut right off, and the engine is run by a small jet which gives a rich mixture. When greater power is required, the main throttle is opened. The effect of this is to dilute the gas somewhat as it is being admitted past the small jet, which has the effect of increasing it in volume without weakening it beyond a useful extent; soon after this the main throttle is opened, and before the gas from the small jet is weakened to any serious extent the main jet comes into operation, and both work together.

"The writer noticed a year ago on a certain make of a car a carburetter in which the main choke tube was so restricted to obtain slow running on the top gear that the automatic valve with which it was fitted would open at two periods—at high and low speeds—the latter causing the unfortunate owner a great deal of annoyance by weakening the mixture when the little required should have been rich."

"The A B C of Electricity." Price, 50c. The Motor World Publishing Co., 154 Nassau street, New York City.

## MOUNTING THE SPEEDOMETER

**One Automobile Manufacturer Makes Special Provision for It—Form It Takes and the Ends Served.**

Manufacturers of accessory equipment are considerably handicapped in designing their attachments by the lack of standardization among the various automobile makers. The result is that, despite their best efforts, unless special fittings are produced for each make of car supplied unsatisfactory results not infrequently are obtained, especially in cases where the mounting of the accessories is done by careless and unskilful garage employees. So great is this difficulty that in at least one instance an automobile manufacturer himself has under-

MARMON SPEEDOMETER BRACKET

taken to provide a suitable and reliable mounting for the speedometer drive, thereby ensuring that such equipment as he furnishes shall be certain to render satisfactory service.

The Nordyke & Marmon Co., Indianapolis, Ind., has inaugurated the practice of fitting a special arm on the steering knuckle of all cars which are speedometer equipped at the factory, while on this arm a special bracket is fitted to carry the speedometer driving gear. The picture shows the general way in which this is done, illustrating the application of the idea for the driving gear of a Warner instrument. In addition to the one shown, special fittings also are produced for use with the Jones and Stewart instruments.

The steering arm is fitted into the knuckle by means of a pin and also a pinned nut on the forward side. When the special fitting is to be applied, the nut is removed and an extension substituted for it, which is secured to the arm in a similar way. This arm affords substantial support for the driving gear, the mounting of which thus is brought into a plane of equal substantiality with the front axle and the ball bearing and steering knuckle construction, which are Marmon characteristics. This sim-

ple provision obviates any owner's troubles consequent upon careless fitting of the speedometer and further relieves the car from any damage which might result were the steering arm to be drilled in an attempt to secure the speedometer gearing—a class of difficulty which has been known, in the experience of other makers, to result from just such causes.

### Providing for the Oil Can.

Although one or two manufacturers now provide special clips alongside the engine for retaining the oil squirt cans when not in use, in altogether too many instances it still is necessary to carry these troublesome portions of the equipment inside the tool boxes. Besides presenting more or less risk of becoming damaged and of flooding the contents of the box under such circumstances, there is the further drawback that during cold weather, oil so carried is liable to congeal and not be available for immediate use when wanted. It is a simple matter to provide means of taking good care of the oil cans inside the engine space, and even where the maker has overlooked this fact, it is little trouble for the owner to attend to the matter himself and make adequate provision.

### Bolts that Should be Kept Tight.

Security bolts which serve to hold the body down upon the frame of the car should be kept tight at all times. Although usually provided with lock washers of one sort or another, this does not guard them against slackness arising from the shrinkage or wearing of the wood sills upon which some bodies are built. Therefore all such bolts should be drawn up occasionally, as otherwise they may become sufficiently loose to allow the body to work excessively upon the chassis and thus become strained and slack in the joints.

### About Brake Equalizing Beams.

Brake equalizing beams which are carried in slots cut in the side frame members to much the same objection which prevails against the older method of equalizing by means of wire rope drawn through the tubular rocker shaft. Dust, mud, rust and heavy grease may oppose unequal resistances to the movement of the two ends of the beam, while also introducing considerable resistance to their motion. It is very essential that the slots be kept clean and well lubricated, if it is desired that the brakes afford full service.

### Where to Test the Cooling System.

Testing the condition of the cooling system by feeling of the outside of the radiator is a quick and handy way of getting at the truth. The observation so made is apt to be misleading, however, unless the hand is pressed against the bottom of the cooler, where the water is at its lowest temperature, and therefore never should be more than blood warm.

## LENGTHENING THE A. A. A. ROLL

Three More State Associations Formed—  
Committees Render Reports, One of  
Them Opposing Speed Limits.

Thirty-three state organizations are now included in the membership of the American Automobile Association, Texas and Alabama being added to the roll at the monthly meeting of the executive committee, held Friday last, 17th inst., at the national headquarters, 437 Fifth avenue, New York City.

Another addition was the Automobile Club of St. Louis, with some four hundred members, which joined as an unfederated club, and which subsequently will be included in the formation of a Missouri Association.

President Lewis R. Speare presided at the meeting of the committee, the others present including George C. Diehl, Automobile Club of Buffalo, chairman of the Good Roads Board; Powell Evans, Automobile Club of Philadelphia, chairman Touring Information Board; Charles Thaddeus Terry, chairman Legislative Board; S. M. Butler, chairman Contest Board; A. G. Batchelder, chairman Executive Committee; William R. Innis, of the National Association of Automobile Manufacturers; H. M. Rowe, Automobile Club of Maryland; J. P. Coughlin, of the Worcester (Mass.) Automobile Club; A. E. Lerche, of the Automobile Club of Springfield (Mass.); C. H. Gillette, of the Automobile Club of Hartford (Conn.); H. A. Bonnell, of the New Jersey Automobile and Motor Club; J. H. Edwards, of the Automobile Club of Hudson County (N. J.); Paul C. Wolff, Pennsylvania Motor Federation; Gorton W. Allen, of the Auburn (N. Y.) Automobile Club, and Secretary F. H. Elliott.

Chairman Terry of the Legislative Board indicated in his report that the National Legislative Convention at Washington, D. C., February 15, 16 and 17, will be a notable event in connection with this important work of the Association. Mr. Terry's committee had held a meeting earlier in the day, at which the reintroduction of the proposed Federal licensing bill was discussed and at which it was made the sense of the meeting that the following clause should be incorporated in all automobile laws:

"Every person operating a motor vehicle on the public highways of this state shall drive same in a careful and prudent manner, and at a rate of speed so as not to endanger the property of another or the life or limb of any person"; in other words, it was the sentiment that there should be no miles-per-hour provision in any such motor vehicle statute.

Chairman George C. Diehl of the Good Roads Board explained the plans of this department for the coming year, and obtained a substantial appropriation for the

carrying on of its work. Reference was made to the National Good Roads Convention to be held in St. Louis next fall.

Chairman S. M. Butler of the Contest Board reported that the 1910 competition rules were practically ready for the consideration of the Executive Committee. The number of applications for sanctions exceeds by far any previous list ever filed early in the season.

Powell Evans, of the Touring Information Board, presented some facts and figures which made clear the certainty of future activities of considerable scope.

George B. Ellis, president of the Automobile Club of Southern California (Los Angeles), and John N. Brooks, of the Connecticut State Automobile Association, were elected members of the executive committee, and the nominations of the following directors by their respective clubs was also approved: Dr. E. W. Omensetter, North Wildwood (N. J.) Automobile Club; Hon. Walter E. Edge, Atlantic City Automobile Club; J. J. Hinners, Edgewater-Fort Lee Automobile Club; Edward C. Smith, Automobile Club of Vermont; William E. Goucher, Jamestown (N. Y.) Automobile Club; J. B. McMurrich, Oswego Automobile Club.

The next meeting of the executive committee will take place at Chicago in February.

### Alabama Forms a State Association.

With representatives present from the Montgomery, Anniston, Mobile and Ozark automobile clubs, the Alabama Automobile Association was organized in the first named city last week and the following officers elected: Dr. Gaston Greil, Montgomery, president; J. M. Valentine, Ozark, first vice-president; A. G. Ross, Mobile, second vice-president; Percy F. Black, Montgomery, secretary, and W. H. McKleroy, Anniston, treasurer. Plans looking to the organization of a state association were discussed, and it was decided that each club represented be requested to elect by ballot at its next meeting a director for the state association. The first annual meeting of the newly organized association will be held the first Monday in April.

### Reviving the Illinois Association.

Seeing in the moribund Illinois State Automobile Association, which, despite its inactivity, retained its affiliation with the American Automobile Association, an agency possible of performing such valuable service to the cause of motoring, some active members of the Chicago Motor Club have rescued it from the slough of despond. A vigorous campaign has been mapped out for the ensuing year, with a view to restoring the association to the prominent position it once held in state motoring councils, and new officers have been elected as follows: Charles P. Root, president; George Ehrhard, vice-president; F. H. Trego, secretary, and John Farson, treasurer.

## TESTING PENNSYLVANIA'S LAW

Accident Leads to Law Suit that Will Decide Whether Motorists Must Stop  
When Trolley Cars Stop.

That clause of the Pennsylvania automobile law making it obligatory on the part of a motorist to stop his car when it nears a halted trolley car, and not to start the car again until all passengers alighting from the trolley car have safely reached the sidewalk, will have its first test in a court of law when a civil suit, instituted for \$25,000 damages, by Arthur Garis, of Abington, comes to trial in the Montgomery County courts, at Norristown, probably at the forthcoming session of court.

Garis, after attending a lodge meeting at Hatboro one night in August last, boarded a car and rode to a point near his home, along the Old York Road at Abington. At the point where the car stopped passengers could alight on only one side—the "highway" side—as a deep gutter made it impossible to alight on the side from which there would have been absolutely no danger from passing teams or motors. It was 11 o'clock at night—a night just "ordinarily" dark.

As Garis started across the Old York Road toward his home—he had less than sixty yards to go—a car owned by Edward S. Radley, a wealthy Philadelphia builder, approached, going southward toward the city. It is understood that Radley's son was the driver of the car. Garis was struck and was very seriously hurt.

Radley, the car owner, carried liability insurance in the Employers' Liability Company of London, a foreign corporation. Protected in this manner, he naturally felt the insurance company should be responsible for the later settlement, which Garis just as naturally expected. But, it has developed, all efforts to reach an adjustment between the attorneys of the insurance company and the attorney representing the injured man have failed, and Harry S. Amber, Jr., an attorney, of Philadelphia, has instituted suit, asking compensation in the amount of \$25,000 for Garis.

The clause in the law cites "that an automobile approaching a trolley car must come to complete stop, and not start until all passengers have alighted from or have boarded the trolley car and the trolley car shall have started." As it will be alleged in the trial of the suit that this clause was violated the crux of the suit is in this particular point, and Attorney Ambler anticipates an interesting trial.

While Radley is the "named defendant" in the suit, it is to be presumed that the insurance company to which he paid money for protection against accidents will be the actual defendant.

REPRESENTATIVE AMERICAN PARTS FACTORIES

### John Farson Suddenly Succumbs.

John Farson, the well known Chicago banker and motorist, and ex-president of the American Automobile Association, died suddenly of heart disease at his home in Oak Park, a suburb of Chicago, early Tuesday morning, 18th inst. Formerly an enthusiastic lover of horses, he took up motoring several years ago and achieved national prominence in the sport, being elected president of the A. A. A. in 1906. He also served the Chicago Automobile Club in several capacities, including the presidency, and at the time of his death was a member of the board of managers, as well as vice-president of the National Good Roads Association and treasurer of the Illinois State Automobile Association. Mr. Farson was born in Union City, Ind., October 8, 1855, and came to Chicago 1877, and in 1885 became a member of the banking firm of Kean & Farson. At the time of his death he was head of the firm of Farson, Son & Co., with branch offices in New York City. He is survived by a wife and two sons, both of the latter being associated with him in business. Through his unfailing good humor and unostentatious generosity he was beloved by many of all classes and was noted for his eccentricities, chief among them being his affection for red neckties and vests; in fact, mention of either in Chicago circles became synonymous with his name.

### Cars for Bee-Keepers Not Stingable.

The automobile as a promoter of bee-keeping seems a far cry, but a publication devoted to that industry has not only traced the connection, but discovered that the bee-keeper's occupation is such that it helps him to become an expert automobilist.

"With a series of outyards and reasonably good roads it is no trick at all with one of these machines to manage twice as many colonies as before," says the publication in question. "It is not only tiresome, but most aggravating to jog along with an old-style wagon and team when one is needed at every yard at the same time. It is then that the long-felt want is most apparent, and it becomes worse when some other fellow passes by with the thing you 'auto' have, and leaves you behind.

"With outyards 20 miles away it is necessary to drive eight hours in hot weather and there are two hours left for work on that trip. With the machine the time would be just reversed—two hours for the trip and eight for work, if ten working hours are figured for the day. Furthermore, with a team it would be cruel to misuse the animals for many such trips; but the automobile, if kept in good working order, would always be ready to go instead of being tired out. Furthermore, the danger of horses being stung would be done away with.

"Bee-keepers generally should more readily learn to manage and care for automobiles than men of any other class, because of their practical knowledge of machinery,

etc. The automobile not only brings the bee-keeper and his bees closer together, aiding him to be a more successful and extensive bee-keeper, but it brings him closer to his neighbors and closer to the markets. It aids both in social as well as in business affairs. One or a dozen miles cuts but little figure with the owner of one of these machines, and he can get more profit and more pleasure out of life. The time is not far distant when every up-to-date bee-keeper will own an automobile. ..

### For the "World's Speed King!"

Probably because they have been in the habit of bestowing crowns on the mimic

kings of the annual Mardi Gras carnival, the people of New Orleans, La., felt that it is but proper that they should also provide for the creation of a "world's speed king," to be chosen at the two days race meet, February 4-5, which will be held in connection with the carnival. To that end Klaw & Erlanger, the theatrical managers have offered, through the New Orleans Automobile Club, a "speed crown," which as the accompanying photograph shows, is really a plaque to be awarded to the winner of the ten miles race for the American amateur championship. The trophy is valued at \$500, and there also are offered two other trophies of similar value in addition to numerous lesser prizes. There are 14 events carded for the meet, which will be promoted by the New Orleans Automobile Club, under the management of Homer George, and it is promised that most of the prominent drivers will compete.

### Where Negro Chauffeurs Are "In Bad."

As a result of the running down and killing of the six-year-old son of State Senator Eldridge recently, in Memphis, Tenn., by a car driven by James Alexandre, a colored chauffeur, the sons of Ham who ply this vocation are in distinctly bad favor with a large number of the Memphis populace. The feeling is such that President Perkins of the Memphis Automobile Club has issued a call for a meeting of that organization to institute a movement for the abolition of negro chauffeurs in Memphis.

### Says Mile Board Track is Building.

F. E. Moskovics, until recently connected with the Bristol (Conn.) Engineering Co., and who has been identified with the trade in many capacities in the last few years, has become interested in Los Angeles racing affairs and is authority for the statement that Jack Prince's long cherished dream of a mile board track for automobile racing is about to be realized. Work on the new track, which will be located in Los Angeles, Cal., began this week, it is said, and dates for the inaugural meeting, which will last seven days, and has been sanctioned by the contest board of the American Automobile Association, have been set for April 8-17. According to present plans the track will be a true circle, 75 feet wide, with 25 foot banking all around and will be laid with Oregon pine, which is said to be most suitable for the purpose. It is claimed that wood will have less wearing effect on rubber than any other surface, and this, together with the absence of turns, is expected to result in the breaking of a large crop of records.

### Texans Complete State Association.

Permanent organization of the recently formed Texas Automobile Association with headquarters in Houston, has been completed by the adoption of a set of by-laws and the election of the following officers for the ensuing year: Harry Landa, New Braunfels, president; Dupont B. Lyon, Sherman; E. J. Fry, Marshall; J. F. Williams, El Paso; George W. Bancroft, Orange; J. H. Zachry, Uvalde, and Henry Stude, Houston, vice-presidents; J. Arthur Baker, secretary; F. W. Vaughan, Houston, treasurer; directors, Col. J. W. Munn, Galveston; Frank Alvey, Beaumont; E. H. Perry, Austin; O. J. Lorehn, Houston; Dr. F. J. Fielding, San Antonio; M. L. Mertz, San Angelo; Edwin J. Kiest, Dallas; J. F. Minton, Houston; J. W. Link, Orange; E. F. Simmons, Forth Worth; George Ropee, Waco, and J. W. Lagon, Port Arthur.

### St. Louis Chauffeurs May "Do Things."

St. Louis chauffeurs are planning to form a union with the object of preventing incompetent drivers and those under 21 years of age from obtaining professional drivers' cars. As outlined the proposed organization will have an official examining board which will put all applicants for membership through a rigid course of sprouts to determine their fitness to handle cars, before taking them into the fold.

### Montgomery Club to Build a Home.

As the first step towards the attainment of a new home, the Montgomery (Ala.) Automobile Club has appointed a committee consisting of Dr. G. Greil, A. M. Kennedy and Percy Black to purchase a plot of 50 acres on the outskirts of the city, on which a clubhouse will be erected. It will be a \$10,000 structure, and work will be begun shortly.

## RECENT PATENTS.

934,762. Valve Gear for Descending Automobiles. Hippolyt Saurer, Arbon, Switzerland. Filed Aug. 28, 1905. Serial No. 276,183.

1. In a four stroke cycle explosion motor for automobiles, means to retard the speed of the motor when the automobile is running by momentum or gravity and the supply of the explosive medium is stopped, the said means comprising a shifting device with a roller interposed between the stem of the outlet valve and the cam for actuating the same and the roller being adapted to roll on the cam, and means under the control of the driver for varying the position of said shifting device.

934,862. Removable Rim for Vehicle Wheels. George S. Van Voorhis, Boston, Mass. Filed March 13, 1908. Serial No. 420,864.

In a vehicle wheel, a permanent rim having an integral outwardly extending flange on one side and an inwardly extending flange on the other, a removable rim seated on the permanent rim and having outwardly extending rim retaining flanges and an inwardly extending flange abutting against the inwardly extending flanges of the permanent rim, said inwardly extending flanges having open ended slots, and pivotally attached locking bolts resting in said slots.

935,036. Gear Casing for Motor Vehicles. John C. Lott, Columbia, S. C. Filed June 18, 1908. Serial No. 439,129.

1. In a motor vehicle, the combination with its running gear and frame, of a sprocket wheel mounted on the running gear, a driving chain, a hood or apron open at its rear end and suspended from the frame, a gear casing secured to the running gear at one end and having the other end open and extending into the apron for receiving said driving chain, and means for limiting the lateral play of the casing and guiding it in its vertical oscillations.

935,108. Automobile Safety Appliance. Mortimer A. Howe, Tacoma, Wash. Filed Feb. 15, 1909. Serial No. 478,008.

1. In a device of the class described, the combination with the frame of an automobile; of a pair of bars or feelers pivoted to said frame and extending in front of each front wheel; a pair of cross-bars rotatively mounted on the frame and each operatively connected with one of the feelers; and pairs of means mounted on and operated by said cross-bars whereby the course and force of the automobile is controlled by either of the feelers.

935,190. Wind Screen. Edwin K. Conover, Paterson, N. J., assignor, by mesne assignments, to C. A. Mezger, Incorporated, Brooklyn, N. Y., a Corporation of New York. Filed Nov. 26, 1907. Serial No. 403,857.

1. A wind screen for motor vehicles having an inclosing frame formed with a groove along its inner side, said groove having its outer or entrance portion contracted relatively to the inner or base portion of the groove, a resilient metal retaining strip substantially U-shape in cross section sprung into said groove and having return bent side portions, a glass shield plate inclosed by said frame and retaining strip and having its edges received between the return bent sides of the retaining strip and a cushion seated in the retaining strip and engaged by the edge of the shield plate.

935,211. Motor Vehicle. Allen Loomis,

Detroit, Mich., assignor to Packard Motor Car Company, Detroit, Mich., a Corporation of West Virginia. Filed Jan. 2, 1908. Serial No. 408,923.

1. In a motor vehicle, the combination with the frame, the rear axle casing and the torsion rod rigidly connected with the rear axle casing and connected at its forward end with the frame, of springs connected to said frame and rigidly secured between their ends to said rear axle casing, the portions of said springs rearward of said casing being adapted to flex more freely than the portions forward thereof, for the purpose set forth.

936,337. Carburetter. Karl Maybach, Paris, France. Filed Jan. 15, 1908. Serial No. 410,938.

1. In a carbureting apparatus, the combination, with means for directing the flow of the moving body of fluid to be carburetted, of a supply for the carburetting liquid, means for conducting the carburetting liquid from the supply into operative proximity to the path of flow of the moving body of fluid to be carburetted comprising a tubular structure having its discharge end projecting upwardly and open, and a tubular discharge device arranged in the upper end of said structure and having less external diameter than the internal diameter of the same, the upper ends of said structure and the discharge device being approximately in the same plane, substantially as described.

936,394. Signal and Tail Light. Paul C. Woodnut, Port Washington, N. Y. Filed Jan. 27, 1909. Serial No. 474,456.

1. In a signal for vehicles, a rotating shaft driven by the vehicle, a signal light having a plurality of apertures, a semaphore adapted to oscillate so as to cover certain of said openings, and means governed by the speed of the shaft for operating said semaphore.

936,446. Bulb Support. Frank Gorman, New York, N. Y., assignor of one-third to Leon Sussman, Bayonne, N. J., and one-third to James A. Watt, New York, N. Y. Filed April 29, 1908. Serial No. 429,935.

1. The combination of a pear-shaped compressible bulb and a support therefor comprising a ring fitted around the bulb between its neck and the point of greatest diameter, longitudinal bars converging from said ring toward the neck and engaging the bulb along their entire length, and a clamp for securing the support on the neck of the bulb.

936,513. Vehicle Seat. Judson Benson, Amesbury, Mass. Filed Dec. 12, 1908. Serial No. 467,145.

1. The combination with a seat, a bar or carrier to which the seat proper is hinged with capacity to be swung vertically, and a support on which the said bar or carrier is mounted with capacity to be turned horizontally, of a spring actuating locking device acting normally to lock the seat from turning horizontally out of position for use, and a projection carried by the seat proper and caused by the upward swinging movement of the latter to positively disengage the said locking device so as to render the seat free to turn horizontally.

936,750. Supplemental Wheel for Motor Cars. Arthur E. Whitner, Winchester, Mass. Filed June 22, 1908. Serial No. 439,884.

1. A supplemental wheel for motor cars having a central flanged annular member

provided with a cylindrical flange projecting therefrom at right angles to its outer face, a tire supporting rim, a yielding tire upon said rim, and a plurality of tubular spokes between said rim and the flange of said annular member and rigidly secured to said rim and flange, said annular member being provided with means for securing it to one of the supporting wheels of the car.

936,831. Vehicle Lamp Attachment. Arthur G. Thompson, San Francisco, Cal. Filed Dec. 8, 1908. Serial No. 466,448.

1. In an automobile, the combination with the body and the steering wheels thereof, of a lamp pivotally mounted on the body, and means extending between the wheels and engaged directly thereby to turn the lamp in unison with the wheels.

936,837. Tire. Henry L. Walbridge, Springfield, Mass., assignor to The Chandler Company, Springfield, Mass., a Corporation of Massachusetts. Filed Aug. 24, 1907. Serial No. 389,929.

1. A tire including in combination, a tread and means for yieldingly supporting said tread, said tread containing a plurality of continuous layers of fabric extending circumferentially about said tire and protruding flush with the road contacting surface, said layers lying substantially normal to the road contacting surface and being separated from each other by a layer of rubber.

937,005. Lamp Working Apparatus. Thomas C. Luce and Charles R. Silvernail, Dalton, Mass. Filed Dec. 14, 1908. Serial No. 467,379.

1. In an apparatus of the kind described, the combination with the lamp bracket, of a crank loosely connected therewith, a second crank tightly connected with the bracket, teeth arranged in pairs on the two cranks, and a pin extending through one of the cranks and having lugs to engage both pairs of teeth.

934,187. Detachable Wheel Rim. Carl Kind-scherf, Hanover, Germany, assignor to The Firm of Continental Caoutchouc & Gutta Percha Compagnie, Hanover, Germany. Filed June 30, 1908. Serial No. 441,251.

A device for securing removable tire rims of the character described, comprising a bolt and a nut working thereon together with a wedge piece pivoted on said nut and adapted to engage a rim, said wedge piece being moved into and out of engagement with said rim by the rotation of said nut and swiveling on said nut when cleared of said rim, so as to permit the removal of the latter, as described.

934,264. Friction Clutch Mechanism for Automobiles and for Other Applications. Alberto Balloca, Turin, Italy, assignor to Company Itala, Fabbrica di Automobili, Turin, Italy. Filed Jan. 18, 1906. Serial No. 296,730.

1. In a friction clutch mechanism, the combination of flat frictional discs alternated with cylindrically bent discs.

934,366. Means for Supplying Oil to Carburetters. Matthew Steel, Jr., Gosforth, England. Filed April 24, 1908. Serial No. 429,008.

1. The combination of a carburetter, an oil tank, means for supplying air under pressure to said carburetter, a dish open to atmospheric pressure located on top of said tank, and connections between said carburetter and said tank and said carburetter and said dish, substantially as described.

937,146. **Armor Tired Wheel.** Charles E. Dulin, Glens Falls, N. Y., assignor of one-half to F. D. Howland, Sandy Hill, N. Y. Filed Oct. 28, 1908. Serial No. 459,952.

1. The combination with a flanged wheel rim, of a hollow shoe provided with a co-operating flange, adapted to be secured to the rim, said shoe being substantially elliptical in cross section, with the major axis parallel with the axis of the wheel and provided with a peripheral flange, and a pair of rigid rings clamped on opposite sides of the flange and immovably secured to the flange and the shoe.

937,153. **Ball Bearing.** Oscar H. Karcher, Lansing, Mich. Filed Jan. 19, 1909. Serial No. 473,163.

1. In a bearing of the class described, an annular bearing member formed with ball races and an annular rib separating the races, an inner bearing member having a bearing surface which at all points is defined by the arc of a circle having its center coincident with the axis of the said inner member, balls within the ball races of the said outer member, the inner member being free to oscillate and rotate within the outer member, and an element carried removably upon the bearing surface of the inner member engagable with the balls in one race whereby to limit the oscillatory movement of the said inner member.

437,186. **Tire for Vehicle Wheels.** Frank A. Seiberling, Akron, Ohio. Filed July 2, 1908. Serial No. 441,570.

1. A vehicle tire consisting of a base having an expansible and contractible inner face, and a series of transversely extending non-elastic, vulcanizable hard rubber elements suitably spaced from each other and embedded in and arranged at the inner part of said face, said elements and said base intimately connected together to provide a homogeneous tire.

937,211. **Automobile.** Henry K. Holsman, Chicago, Ill. Filed Jan. 18, 1907. Serial No. 352,848.

1. In a motor vehicle, in combination, a frame having engine supporting beams, a shiftable engine arranged beneath and movably supported from said beams, a transverse engine shaft carried by and shiftable with said engine, manually controlled engine shifting and locking means, a vehicle traction wheel, and an endless friction driving belt between said shaft and said wheel, and controlled by the position of said engine, substantially as described.

937,212. **Braking Mechanism for Automobiles.** Henry K. Holsman, Chicago, Ill. Original application filed Jan. 18, 1907, Serial No. 352,848. Divided and this application filed Feb. 1, 1909. Serial No. 475,341.

1. In a device of the class described, the combination with the traction wheel, of the frame, the engine shaft movable to and from the traction wheel to stop and start the vehicle, driving connections between the engine shaft and the traction wheel, an annular braking surface rotating with the traction wheel, and a brake moving with the engine shaft to engage the annular braking surface as the engine shaft is moved to stop the vehicle.

937,231. **Speed Indicating and Distance Recording Mechanism.** Theodore M. Foote, Boston, Mass., assignor to Peter B. Bradley, Hingham, Mass. Filed Oct. 11, 1906. Serial No. 338,380.

1. A speed indicator for vehicles comprising a driving member, a driven member,

a speed symbol carrying element rotatably connected to the latter and having speed symbols, speed controlled means relatively to move said members into driving contact, and driving contact terminating means to terminate the period of driving contact upon the presentation of the proper symbol.

937,320. **Speed Changing Mechanism.** George D. Munsing, Hoboken, N. J. Filed Feb. 6, 1909. Serial No. 476,401.

1. In a speed changing mechanism the combination with the driven and driving shafts of a gear wheel and a brake wheel, means to drive the gear wheel from the driving shaft, planet gear wheels mounted in said brake wheel and gearing with the said gear wheel, a set of friction discs mounted to rotate in unison with each planet gear wheel, the discs of one set overlapping and alternating with those of an adjacent set, means to exert pressure on the friction discs, a pinion on the driving shaft and a gear wheel on the driven shaft, and planet mechanism connected to the brake wheel and between said gear wheel and pinion.

937,321. **Speed Changing Mechanism.** George D. Munsing, Hoboken, N. J. Filed Feb. 8, 1909. Serial No. 476,599.

1. The combination with a driving and a driven shaft; of a pinion keyed to the driving shaft, planet gear wheels meshing with said pinion and means to frictionally retard the movement of the planet gear wheels, a bevel gear wheel loose on the driving shaft, a supporting member for the planet gear wheels rotatable with respect to the driving shaft, said support and bevel gear wheel rotating in unison, a brake wheel, beveled pinions mounted in the brake wheel, meshing with the beveled gear wheel and a beveled gear wheel on the driven shaft, also meshing with said pinions and means to brake said brake wheel.

937,380. **Radiator.** John A. Miller, Tarrytown, N. Y. Filed July 13, 1909. Serial No. 507,395.

1. A radiator of the character described comprising upper and lower chambers, a central vertical tube, side tubes, and pipes connecting said vertical tube and side tubes.

937,522. **Ignition Apparatus.** George Haniquet, Longbeach, Cal. Filed June 11, 1908. Serial No. 437,872.

1. The combination of a support, a plurality of distributing rings carried by the support and insulated from each other, a series of contacts arranged in a circle and connected with the distributing rings in groups, each group being connected to a ring, electrical connections for the several groups of contacts, and a revolvable brush for successively engaging the contacts.

937,536. **Carburettor.** Frank H. Knight, Washington, D. C. Filed July 23, 1906. Serial No. 327,343.

1. In a carburettor a casing having its central portion provided with a downwardly inclined flange, a movable diaphragm above said inclined flange said diaphragm apertured for the passage therethrough of air and hydrocarbon valve shafts, there being a passageway between the upper surface of said flange and the lower outer edge of the diaphragm, means to adjust the diaphragm toward the flange to control the passage of an explosive compound through the passageway between the diaphragm and the inclined flange, a vaporizing compartment below the diaphragm, ports to admit air and a carburetting fluid into the vaporizing compartment to become thoroughly mixed when drawn from said compartment through the

passageway between the diaphragm and the inclined flange to the space above the diaphragm, valves to control the passage through the air and hydro-carbon ports which open to the vaporizing compartment, and air and hydro-carbon valve shafts to control the air and hydro-carbon valves, substantially as described.

937,557. **Automobile Brake.** Clyde Todd, Pittsburg, Pa. Filed June 25, 1909. Serial No. 504,304.

1. In an automobile brake, the combination with the longitudinal frames and rear axle of the automobile, and toothed wheels mounted upon said axle, of a transverse rock shaft carried by said frames, an operating lever carried by one of said frames for rocking said shaft, cranks carried by said rock shaft, a shaft journaled in said cranks, spacing wheels mounted upon said shaft and adapted to engage the toothed wheels of said axle, a link loosely connected to said shaft, bifurcated hangers loosely mounted upon said axle, a shaft journaled in said link and said hangers, and toothed wheels or shoes mounted upon said shaft in the bifurcations of said hangers.

937,618. **Vehicle Wheel.** Charles A. Lindstrom, Allegheny, Pa. Filed Sept. 6, 1906. Serial No. 333,471.

1. A vehicle wheel having a series of pairs of overlapping plates independent and separate from each other, detachably connected to and interposed between the hub and rim in sliding engagement with each other, and means for creating friction between said plates or brackets.

937,908. **Spark Plug.** Otto C. Winestock, Perkinsville, Vt. Filed Sept. 1, 1908. Serial No. 451,213.

1. A spark plug having a central electrode stem with one end tapering, a removable member for said electrode, a tapering sleeve of insulating material interposed between the tapering end of the electrode stem and the removable member, said sleeve having parallel inner and outer walls, an annular fixed electrode, and a disc-like movable electrode exterior to and of greater diameter than the inner diameter of the fixed electrode, said movable electrode being adjustable bodily to and from the fixed electrode in the direction of the longitudinal axis of the electrode to different active positions relative to the said fixed electrode with the spark gap substantially constant throughout the active portions of the electrodes.

938,053. **Vehicle Fender.** Charles W. M. Guhle, Tuckerton, N. J., assignor of one-half to Frederick J. Ritter, Philadelphia, Pa. Filed Oct. 28, 1908. Serial No. 459,817.

1. The combination with a vehicle, of a fender comprising a spring arm fixed at one end, and means connected to the free end of said arm and detachably connected to said vehicle to hold said spring arm in a flexed condition, said arm being released from said condition by a further flexing thereof.

938,108. **Spark Plug.** William S. Rech-told, Newark, N. J. Filed June 24, 1909. Serial No. 504,027.

1. In a spark plug: the combination with a socket, and a sparking terminal attached thereto; of an insulator fitting within said socket; a bushing screwed into said socket to hold said insulator in place; a sparking pin passing centrally through said insulator to co-operate with said sparking terminal; a terminal cap secured to the outer end of said insulator; and means passing through said cap to advance said sparking pin.

## Breech Block Spark Plugs

Give satisfaction in fullest measure. You can clean them and yourself remain clean while you do it. A quality product all the way through.

## PACKARD TO TRY NEW POLICIES

**Will Seek to Control Prices of Its Used Cars—"Moral Suasion" to Promote Exclusive Agencies.**

What probably is the first attempt of an automobile manufacturer practically to control or direct the sale of second hand cars of his production has been undertaken by the Packard Motor Car Co. This company has adopted a graduated schedule of prices to apply on its used cars of each succeeding year and its agents will be required to adhere to it as strictly as is the case with new Packards.

In line with this move, the Packard people have under consideration an equally interesting experiment, which is nothing less than the first step toward the adoption of an exclusive agency policy. First reports stated that such a plan was about to be put into effect and that it would embrace all Packard agents, but according to more authoritative information, the policy merely is under discussion and if adopted will apply only to the dealers in the larger cities, whose sales are sufficiently great to assure a good income and who therefore have less need of a lower priced line. The Packard company believes that with a fixed scale governing the used cars of its manufacture, such cars will take the place of such lower priced lines as may be handled by the larger agents. It is stated that no immediate effort will be made to apply thumb-screws in the enforcement of the policy; "moral suasion," which will point out the beauties of such exclusiveness is expected to achieve the same end.

### Morley Goes from Tires to Tops.

Having Bert Morley as president and treasurer, Claire L. Barnes, vice-president, and W. F. Connelly, secretary, a new company has been organized in Detroit, Mich., with \$25,000 capital, to buy outright the Auto Accessories Manufacturing Co., on

Congress street, which, in addition to handling a general line of accessories, has been making tops, wind shields and kindred parts. The new company is to be known as the Sterling Auto Top Co., and President Morley, who until recently was the Detroit manager for the Diamond Rubber Co., indicates that it will take up the manufacturing end more vigorously than before.

### Lozier Gets Detroit Money and Plant.

The Lozier Motor Co., of New York City, which for some time has been negotiating a plan by which it should gain a number of new Detroit stockholders and should establish a plant in that city, finally has completed arrangements to that end. The company's present plant at Plattsburg, N. Y., will be retained, but an investment of approximately \$1,000,000 will be made in the factory which is to be established in Detroit, where the general offices of the company ultimately will be located.

### May Make Magnetos in Wyandotte.

The Whistler Mfg. Co., organized for the manufacture of magnetos and having a present capitalization of \$10,000, is trying to obtain a subsidy from the people of Wyandotte, Mich., which is "just down the river" from Detroit. Investigation is being made by the Wyandotte taxpayers as to whether they should subscribe for \$15,000 worth of stock in order to obtain the proposed factory, which, it is asked, should be free from taxation and water rates for a period of five years.

### Fisk Increases Capital to \$4,000,000.

At a special meeting of the stockholders held yesterday, the Fisk Rubber Co. voted to increase its capital stock from \$600,000 to \$4,000,000, equally divided into common and preferred shares, as is the present capitalization. It officially is stated that the entire issue has been underwritten. The growth of the Fisk business since 1904 and the desire to add to the present plant and equipment are given as the reasons for the big increase of capital stock.

## CREDITOR SUES BUICK FOR \$100,000

**Tiring of Promises to Pay, Castings Makers Go to Law—Buick "Covers up" with Counter Suit.**

Wearied of waiting for the payment of its large account, which was put off from week to week, the Wetherill Finished Castings Co., of Philadelphia, on Tuesday last, 25th inst., instituted action in Detroit against the Buick Automobile Co., of Flint, Mich., for \$100,000, the amount claimed to be due. Writs of garnishment were immediately served on four banks in which Buick funds are deposited.

Carrying out a threat which had been made after the Wetherill people became pressing in their demands, the Buick company in turn instituted proceedings against the Wetherill company for the recovery of \$250,000 damages claimed to have been sustained by reason of the Philadelphia concern's alleged failure to make deliveries according to contract, and also because the goods were not up to the required standard. The Buick account was some four months overdue and all other efforts failing, one of the Wetherill principals, late last week went to Michigan to enforce collection or know the reason why; the suit is the outcome of the visit. The Wetherill company has supplied the castings used in a number of the best cars on the market and their reputé or the reputé of their product never has been questioned and the company states that it never was questioned even by the Buick people until insistent demands were made for payment of the long overdue account. The Buick company is the chief cog in the General Motors "trust" project and it was its demand for four months' credit that caused some 30 material and accessory manufacturers to meet in New York to consider the demand. The conference resulted in a decision not to take the risk involved and the credit was refused.

## LICENSED DEALERS GET TOGETHER

**New York Agents Hold First Meeting to Organize—May Dissolve Existing Trade Association.**

Considerable mystery was thrown around the meeting of New York dealers which was called for the purpose of organizing a "Licensed" dealers' association. Twenty-six of the 54 concerns in the metropolis handling cars licensed under the Selden patent, gathered at the Hotel Astor on Thursday, 20th inst., and although they were in session for some time the official report of their proceedings was exceedingly brief. The meeting having been called to order by Sidney B. Bowman, it was moved and carried that Percy Owen, of the Chalmers-Detroit Motor Co., be made temporary chairman, with Bowman acting as temporary secretary. As a result of the deliberations, the chairman was instructed to appoint a committee on organization, composed of five members, which also is to act as a nominating committee. Announcement by the chairman as to who the committee will be is to be made later, and an adjournment was taken, subject to his call.

Something further of what took place at the Hotel Astor meeting transpired on the following Tuesday, 25th inst., when the New York Automobile Trade Association held a meeting at the Automobile Club of America, at which General John T. Cutting, the president, tendered his resignation, to take effect on February 15. He explained that he was resigning from the Trade Association in order to join the association of licensed dealers. In fact the meeting appeared to be chiefly for the purpose of preparing the Trade Association for dissolution or reorganization, so that those of its members who handle licensed cars may withdraw and join the new organization. Inasmuch as the Trade Association numbers among its members a great many garages and accessory houses who, since they do not sell cars, have little concern one way or the other with the licensed question, there is considerable sentiment toward continuing the association as an organization for the metropolitan garage and accessory interests alone, although it is probable that in such a case it would have to change its name. When the licensed dealers have withdrawn and the fate of the Trade Association is decided, the organization of the licensed dealers is expected to proceed with promptness.

### Pope Common to Draw Dividends.

Dividends on the common stock of the Pope Mfg. Co., of Hartford, Conn., are to commence this spring, and an initial common stock distribution at the rate of 6 per cent. per annum is to be declared before April 1. Under the re-organization there is

about \$3,500,000 of the common stock outstanding, on which the company is estimated to be earning about 20 per cent. after allowing 6 per cent. on the \$2,400,000 preferred. For the year 1909, when the company made approximately 800 cars, the company earned about 10 per cent. on the common, which in the last few months has advanced from 50 to about 85, with a corresponding gain in the preferred.

### Bankruptcy Follows Proprietor's Death.

A petition in bankruptcy has been filed against the Pierson Motor Supply Co., a New York supply house with a branch in Brooklyn, the three petitioning creditors having claims aggregating \$581, of which \$400 is for back rent. Walter G. Pierson, the president of the company, died on the 14th inst., and it is alleged that the company is insolvent and that it has been admitted by Helen T. Pierson, the secretary, that it is unable to pay its debts. The concern was incorporated two years ago with \$20,000 capital. The liabilities are placed at \$7,500, and the assets at about \$4,000.

### End of Elkhart's Industrial in Sight.

A receiver has been appointed for the Industrial Automobile Co., of Elkhart, Ind., the liabilities being placed at \$4,313.59, as against considerably less in assets. The company commenced business last April, making cars, motors and parts. It is alleged in the petition that the stock and machinery of the plant were being disposed of; that there are numerous creditors threatening suit, and that a receivership is necessary to conserve the interests of the creditors.

### Three More Secure Selden Licenses.

Further additions have been made to the list of licensees under the Selden patent in the Acme Motor Car Co., of Reading, Pa.; the American Motor Car Co., of Indianapolis, Ind., and the Hol-Tan Co., of New York City, the latter the importer of the Lancia car. Another group of new licensees is to be announced by the Association of Licensed Automobile Manufacturers within a day or so.

### Delmar to Make Bodies and Wheels.

The Delmar Auto Body & Wheel Co. is a new enterprise which has been established in Indianapolis, Ind., the plant being located in west Indianapolis. In addition to bodies and wheels, the concern also will make tops. The management is under the direction of E. H. Habig and E. E. Weir, who have been identified with Indianapolis manufacturing for many years.

### Bennett Joins Colt-Stratton Staff.

Albert L. Bennett has been appointed sales manager of the Colt-Stratton Co., the New York agents for the Cole Thirty and the Paige-Detroit cars. He has been in the selling end of the business for nine years.

## STILL DEMANDING AN INJUNCTION

**Studebakers Continue Action Against E-M-F.—Delayed Arguments Simply Recite Old Contentions.**

The delayed hearing of the Studebaker Automobile Co.'s injunction suit against the E-M-F. Co., in Detroit, took place before Judge Swan in the United States Circuit Court on Tuesday, 25th inst., and the proceedings made it very plain that the South Bend company has not relaxed in the slightest in its insistence that the E-M-F. Co. be enjoined from disposing of its cars except through the Studebaker channels. The entire day was taken up by the arguments of Attorney John S. Miller, presenting the Studebaker case, and Attorney Elliott C. Stevenson, for the E-M-F. Co. Judge Swan then allowed counsel three days in which to file briefs, when he will take the case under advisement.

The arguments were chiefly a legal rehash of all the charges, counter-charges and difficulties that have arisen between the two sides as a result of the confusion existing as to what part of their arrangement was actual contract and what part mere business "forecasts," unauthorized promises and tentative arrangements. The Studebaker attorney consumed the entire morning while the E-M-F. attorney took the afternoon. The latter dwelt at considerable length on the history of the projected \$80,000,000 merger proposition which he alleged the Studebakers had been fostering, and again declared that it was the Studebaker purpose to embarrass the E-M-F. Co. and make the stockholders sell their holdings, so that the Studebakers could get control and start the merger.

The fact that the Studebaker company made no effort to proceed in the original court of jurisdiction from December 27, when the original application for an injunction was withdrawn, until the present time, the E-M-F. attorney contended, excluded the plaintiff from the remedy sought.

"Since that time, your honor," he added, "we have sold \$14,000,000 worth of cars. The plaintiffs went out of court voluntarily and in the meantime we have made contracts to sell 18,000 machines, which affect 12,500 working men and establish obligations which must be met. This situation would not have arisen but for their dilatory conduct. They had 1,000 dealers. We now have 4,500. The courts are still open to them on the question of damages."

### Fal Begins Work on Big Factory.

The Fal Motor Co., of Chicago, Ill., has in process of erection a new factory which is scheduled to be ready for occupancy by the first of June. It is to have 250,000 square feet of floor space, with its own power plant and a half-mile testing track.

**HOW TO AVOID THE SELDEN PATENT**

**Diplomats of Licensed Association Point the Way for Budding Manufacturers—  
Cars that do not Infringe.**

Carriage makers who have been affected by the trend of the times and who feel an itching to take up the manufacture of automobiles have discovered an alternative course which provides a way out of the difficulties which confront them in regard to getting a Selden license for the making of gasoline machines.

In addition to the great number who already have undertaken to make gasoline in come quantity, there are many more who still are in the purely experimental stage, having made perhaps one or two cars, but equally numerous are those concerns who have not as yet made a car of any kind, but who have been considering the possibilities of building gasoline vehicles. From all three classes there have come in the last few weeks a flood of applications for licenses, and the Association of Licensed Automobile Manufacturers has been obliged to advise most of them that their chances are exceedingly slim, inasmuch as the Association's policy as now determined upon is to grant licenses only to such concerns as actually have been making cars for a considerable period.

That their case is not hopeless, however, so far as concerns the manufacture of automobiles is made plain by the fact that not a few of them have turned to electric vehicles as a solution for their problem, this being a field which is not controlled by any "basis patent" situation. In diverting the mind of the carriage maker to the electric as the type he should espouse for his automobile making ambitions, the arguments presented are alluring in the extreme, and give rise to some surprise as to why more carriage makers have not been already attracted to the electric vehicle rather than gasoline.

It is pointed out that while it now is possible to get ready-made gasoline motors, gear boxes and other parts, a great measure of designing skill and experience is necessary to make an assembly of these that will result in a satisfactory car, and that even the assembling alone entails a degree of expense and an amount of factory equipment which requires a heavy investment. On the other hand the assembly of electric vehicles is comparatively simple, in that the intending manufacturer is given every technical assistance by the manufacturers of electric motors and batteries as to the equipment that should be used for each type and kind of vehicle. All the necessary parts of the power plant and controlling system are readily available, and, what is more, can be obtained with a degree of promptness which is almost impossible in the gasoline

field. While a few important questions of design are involved in the selection of a system of transmitting the power from the motors to the rear wheels, they by no means present the engineering problems of a gasoline car.

With an organization of agents who are in touch with the better class of retail carriage trade, the carriage maker's chances of disposing of electric pleasure vehicles are represented as being quite as good as with gasoline machines, especially since women are getting to look upon the electric with growing favor. Every opportunity is presented in the designing of new and improved bodies, so that the carriage maker's body building abilities and capacity are apt to be given all the test he may desire.

Many of the experimenters have been dissuaded from beginning quantity production in the gasoline field, but are taking up the electric instead. The likelihood of the electric receiving considerable impetus from the carriage making ranks is further increased by the fact that the virtues of the electric as a manufacturing proposition are being pointed to in the case of those who have not as yet taken up either type but who have expressed the intention of becoming automobile builders if possible.

**Bossert to Produce Stamped Parts.**

Pressed steel automobile parts are to be manufactured on a large scale by the Bossert Electric Construction Co., of Utica, N. Y., which for a dozen years has been making stamped and drawn steel specialties for the electrical trade. James P. Jones, who has been in the stamping business for 15 years and is especially familiar with the requirements of the manufacturers of automobile axles and wheels, became manager of the company on the 7th inst., and some \$40,000 worth of new machinery is being installed, including presses for the manufacture of brake drums, hub flanges, ball cups and retainers, thrust discs, clutch discs and pressed steel step hangers.

**Seattle Dealers Reorganize.**

The Seattle Automobile Dealers Association has been reorganized in that Washington city, with the following officers: President, H. P. Grant, Seattle Automobile Co.; vice-president, R. P. Rice, Seattle manager Ford Motor Co.; treasurer, H. C. Fenn, manager Overland Automobile Co.; secretary, Fred Hainens, Seattle agent for Pierce-Arrow. These officers, together with W. D. Wallace, manager Olympic Motor Car Co., and E. J. Strelau, manager Motor Equipment Co., comprise the board of directors.

**Shackelford Gets Empire Branch.**

J. M. Shackelford has been appointed manager of the uptown New York City branch of the Empire Tire Co., of Trenton, N. J., at Seventy-third street and Broadway. He succeeds Marcus Allen who recently resigned.

**REDUCED RATES TO CHICAGO SHOW**

**Two Passenger Associations Grant Fare and a Half—Procedure Necessary to Obatin Advantage of It.**

Due to the fact that the American Automobile Association will hold an open convention in Chicago during the period of the show there, the Trunk Line Association and the Central Passenger Association have granted a rate of a fare and one-half to all who attend the convention from the territory embraced within their territory. The rate is an open one and is not restricted to members of the A. A. A., but it is conditional on at least 1,000 certificates being presented for validation in Chicago.

The territory of the two passengers associations includes the states of New York, Pennsylvania, New Jersey, Delaware, Maryland, District of Columbia, Virginia (points on Chesapeake & Ohio and Baltimore & Ohio), West Virginia, Michigan (east of Lake Michigan), Indiana, cities of Louisville, Ky., and St. Louis, Mo., and stations in Illinois, and points east of and on line of the C. R. I. & P. R. R., from Chicago to Peoria; thence the T., P. & W. R. R. from Peoria to Burlington, thence Mississippi River to Cairo, Ill.

All persons residing outside the territory defined and who desire to avail themselves of the rate, should purchase regular one-way or excursion tickets to the nearest point from which a certificate reduction has been authorized, and there purchase a one-way ticket to Chicago and secure certificate.

Tickets and certificates may be secured not earlier than February 2, 1910, and not later than February 8. These tickets should be presented for validation at the A. A. A. headquarters in the First Regiment Armory, Chicago, February 8, 9, 10, 11. In view of the necessity of having the 1,000 certificates actually in hand before the validating can begin on Tuesday morning, February 8, it is imperative that certificates be deposited on arrival in Chicago.

The holders of tickets will be entitled to procure up to and including February 16, a continuous passage ticket by the same road over which the going journey was made, at one-half of the regular one-way, first-class fare, to the point at which the certificate was issued.

All meetings in connection with the convention will take place in the First Regiment Armory. Due notice of them will be available at the A. A. A. headquarters in that building and in the public prints.

**New Supply House in Seattle.**

The Wahsington Automobile Supply Co. has been organized in Seattle to do a business implied by its title; it will locate at 700-702 Pike street, and will be under the management of W. B. Neff.

**THE WEEK'S INCORPORATIONS.**

East Stroudsburg, Pa.—Sharp-Arrow Automobile Co., under Pennsylvania laws, with \$75,000 capital.

Racine, Wis.—Wisconsin Auto Top Co., under Wisconsin laws, with \$25,000 capital, succeeding McAvoy Bros.; to manufacture tops and accessories.

Cape Girardeau, Mo.—Vogel Auto Co., A. J., under Missouri laws, with \$2000 capital. Corporators—A. J. Vogel, E. W. Vogel and W. D. Black.

Dover, Del.—Knight & Kilbourne Patents Co., under Delaware laws, with \$1,000,000 capital. Corporators—W. N. Akers, W. J. Maloney and E. B. Davis, Wilmington.

East Orange, N. J.—Taxi-Service Co., of Baltimore, under New Jersey laws, with \$500,000 capital. Corporators—F. C. McKinney, A. R. Mapletoft and R. E. Taylor.

Los Angeles, Cal.—William R. Ruess Automobile Co., under California laws, with \$50,000 capital. Corporators—William R. Ruess, Lona Maude Ruess and Thomas F. Keefe.

Trenton, N. J.—Druck Auto Selling Co., under New Jersey laws, with \$30,000 capital; general automobile business. Corporators—N. P. Druck, E. H. Steele and L. B. Risdon.

Dover, Del.—Auto Storage Co., under Delaware laws, with \$30,000 capital. Corporators—H. E. Seibert, H. O. Keenery, Philadelphia, and W. E. Harrington, Pottsville, Pa.

Hackensack, N. J.—Bacon's Garage, under New Jersey laws, with \$50,000 capital; to deal in automobiles and supplies. Corporators—J. Bacon, R. D. Earle and R. D. Earle, Jr.

New York, N. Y.—Childs & Co., Inc., S. W., under New York laws, with \$25,000 capital; general garage business. Corporators—S. W. Childs, M. H. Childs and W. G. Whaley.

Louisville, Ky.—Straeffer-Arterburn Motor Car Co., The, under Kentucky laws, with \$4,000 capital. Corporators—E. Edgar Straeffer, Burton H. Arterburn and George Straeffer, Jr.

Pittsfield, Mass.—Alden Sampson Mfg. Co., under Massachusetts laws, with \$300,000 capital; general automobile business. Corporators—L. E. Sampson, G. E. Mitchell and others.

Chicago, Ill.—Oak Park Garage, under Illinois laws, with \$10,000 capital; general machine shop and garage business. Corporators—Robert B. Crandall, Rosell Irving Wallis and Richard C. Hanna.

New York, N. Y.—Post Lock Register Co., under New York laws, with \$150,000 capital; to manufacture taxicabs and lock registers for same. Corporators—T. W. Post, G. W. Morse and C. Colgate.

Buffalo, N. Y.—Ballou Co., F. A., under New York laws, with \$25,000 capital; to manufacture and deal in automobiles, bicy-

cles and other vehicles. Corporators—F. A. Ballou, C. H. Phillips and H. J. Harrison.

Denver, Col.—Colorado Interstate Motor Car Co., under Colorado laws, with \$5,000 capital. Corporators—Henry A. Linthroth, William Thorney and Richard H. Zinke.

Indianapolis, Ind.—Co-Auto Motor Co., The, under Indiana laws, with \$25,000 capital. Corporators—Mark C. Beckner, John Larrison, Fred W. Wiese and Harry W. Woodmansee.

Lafayette, Ind.—Hoffman-Moore Auto Co., The, under Indiana laws, with \$10,000 capital; general automobile business. Corporators—A. E. Hoffman, W. W. Hoffman, and S. C. Moore.

Chicago, Ill.—Crescent Garage Co., under Illinois laws, with \$100,000 capital; general taxicab and livery business. Corporators—Frank D. Moon, Charles D. Fuller and Harry L. Fuller.

Camden, N. J.—General Ball Bearing Co., under New Jersey laws, with \$500,000 capital; to manufacture ball and roller bearings. Corporators—J. A. MacPeak, W. F. Fidell and F. R. Hansell.

Detroit, Mich.—Century Motor Sales Co., The, under Michigan laws, with \$10,000 capital. Corporators—J. F. Williams, F. E. Tallmadge, H. P. Tallmadge, W. D. Peabody and L. C. Cope.

Oakland, Cal.—Detrick Co., The, under California laws, with \$5,000 capital; to manufacture automobiles. Corporators—W. G. Gardiner, San Francisco; G. A. McDougald, Oakland, and G. F. Detrick, Berkeley.

New York, N. Y.—Nilmelior Electrical Co., The, under New York laws, with \$150,000 capital; to deal in magnetos and automobile ignition apparatus. Corporators—G. Pouzet, O. V. Schrenk and F. F. Kirkpatrick.

Kansas City, Mo.—Walden W. Shaw Auto Livery Co., under Missouri laws, with \$100,000 capital; to manufacture and deal in automobiles. Corporators—Edward N. D'Ancona, A. J. Pflaum and H. C. McCormick.

New York, N. Y.—Eisemann Magneto Co., under New York laws, with \$470,000 capital; to manufacture and deal in magnetos and electrical apparatus. Corporators—P. Fuller, Jr., A. D. Yeekes, Jr., and C. A. Conlon.

New York, N. Y.—Firestone Tire & Rubber Co., of New York, with \$50,000 capital; to manufacture and deal in rubber tires for vehicles, etc. Corporators—D. C. Swander, New York City; H. S. Firestone, R. J. Firestone, Akron, O.

Bridgeport, Conn.—Royal Engine Co., The, under Connecticut laws, with \$50,000 capital; to manufacture automobile and marine engines. Corporators—Arthur F. Law, H. N. Law, Bridgeport, and Frank I. Prentice, Hartford, Conn.

Asbury Park, N. J.—Asbury Park Auto-

mobile Co., under New Jersey laws, with \$50,000 capital; to manufacture automobiles and conduct a general garage business. Corporators—D. Haynes, F. T. Weeden, W. C. Weeden, and L. P. Croce.

Newark, N. J.—Public Automobile Service Corporation, under New Jersey laws, with \$2,000,000 capital; unlimited taxicab service. Corporators—William R. Buchler, Charles E. Thorne, Ernest D. Kahn, all of New York City, and others.

East St. Louis, Ill.—St. Louis-Stearns Automobile Co. of East St. Louis, under Illinois laws, with \$10,000 capital; general automobile business. Corporators—J. W. Ford, Jr., Dell C. Brown, J. L. Flannagan, C. E. Chamberlin and J. C. Londen.

New York, N. Y.—Motor Car Conveyance Co., under New York laws, with \$100,000 capital; to manufacture and deal in motor vehicles, taxicabs, etc. Corporators—C. E. Lockwood, East Orange, N. J.; A. Lee, Brooklyn, and J. W. Chapman, New York City.

Birmingham, Mich.—Oriental-Detroit Motor Car Co., under Michigan laws, with \$100,000 capital; to manufacture automobiles. Corporators—George E. Daines, Guy L. Watkins, Ellsworth Randall, G. William Crary, Frank Ford, Edgar A. Parks, T. B. Smith and others.

Newark, N. J.—Wind Shield Mfg. Co., under New Jersey laws, with \$100,000 capital; to manufacture wind shields and automobile accessories. Corporators—C. A. Mezgar, R. H. Montgomery and R. M. Owen, New York City, and W. W. Trimpi and J. Close, Newark, N. J.

**Increases of Capitalization.**

Kansas City, Mo.—Auto Specialty Co., increases capital to \$30,000.

Detroit, Mich.—Watt Motor Co., increases capital from \$100,000 to \$300,000.

Akron, O.—Stein Double Cushion Tire Co., increase in capital from \$100,000 to \$200,000.

Topeka, Kan.—Smith Automobile Co., The, a Missouri corporation increases capital \$100,000.

**Studebakers' Palatial Branch Completed.**

What is claimed to be the finest sales and garage building in Denver, Col., just has been completed for the Studebaker Automobile Co. It is located on Cheyenne street between Fifteenth and Sixteenth streets and the company now is emigrating from its old quarters on Broadway.

**Ford to Maintain Texas Branch.**

The Ford Motor Car Co. will establish a branch in Dallas, Tex., on February 1, which will be located at 443-45 Commerce street. The quarters will consist of two stories and basement and will include a complete repair shop. Byron L. Graves will have charge of the establishment.

## IN THE RETAIL WORLD.

The Beaver Valley Motor Co., Rochester, Pa., when alterations are completed will "open up" in the Traction building with the Reo and Olds lines.

J. C. Eagen, Oklahoma City, Okla., is preparing to open sales rooms on Fifth street in that city. He will act as state distributor for the Parry cars.

The McAllister Bros. Motor Co., Pittsburgh, Pa., are preparing to let the contract for the erection of a garage on Baum street. The structure will cost \$25,000.

The Sweet-Edwards Co., Omaha, Neb., has taken possession of its new garage on Farnam street. The concern will handle the Moon, Parry and American cars.

The J. A. McIntyre Co., Omaha, Neb., is having built a new garage on Farnam street, the local "automobile row." The company represents the Oakland cars.

C. H. Goss, St. Johnsbury, Vt., the oldest dealer in the city, is having built a new garage on Central street, the cornerstone of which was laid last week. He represents the Packard.

Frank Yates, Omaha, Neb., has embarked in the renting business, with a squad of Stevens-Duryea and Inter-State cars. For the present he will make his headquarters at the Kimball garage.

M. J. Spencer, Pontiac, Mich., has purchased a plot of ground adjoining the Colonial hotel, and will erect a garage thereon. The structure will be 39x100 feet and will include the repair department.

The Pennsburg (Pa.) Automobile Co., which operated a garage in that town, has been dissolved, John F. Weyand retiring from the firm. V. H. Steckel will continue the business under the old name.

E. W. Squires, New Haven, Conn., has had plans drawn for a garage to be erected at the corner of Whalley avenue and Orchard street. The structure will be of brick, one story, with dimensions 48x88 feet.

The Skowhegan Garage, Skowhegan, Me., has been formed in that town to take over the business of the Skowhegan House Garage. The members of the firm are W. H. Norton, Charles M. Hobbs and H. I. Spinney.

Seamans Bros., Canandaigua, N. Y., are erecting a garage said to be the largest between New York and Buffalo. It will be one block long and will have two entrances, one on Phoenix street and the other on Lafayette avenue.

George Keyt & Son, Rockford, Ill., old-time liverymen of that place, have "seen the handwriting on the wall" and added automobiles to their line. They have secured the Stearns agency, and will conduct a taxicab service also.

Henry Kerst, Jersey City, N. J., had had plans drawn for a new garage which will be erected on the west side of Crescent avenue near Astor place. It will be a one

story brick structure, 50x75 feet, and will cost about \$7,000.

The Myatt-Dicks Co., New Orleans, La., has leased the property adjoining the Spofford estate at St. Charles and Julia streets, and will erect a large and up to date garage. The structure will be 45x150 feet and will be of fireproof construction.

The Western Motor Car Co., Springfield, Mo., have leased for three years the Auditorium rink on Pickwick avenue, which will be used for a repair shop. The present quarters on Jefferson street will be devoted to salesrooms and garage.

Col. A. T. Pierce, Dover, N. H., proprietor of the American House, soon will let the contract for a new garage to be erected in the rear of the hotel. The establishment will be built of steel and concrete, and will have ample storage and repair facilities.

The Velie Motor Vehicle Co. is having built in Kansas City, Mo., a large and well equipped building to handle their local trade. The structure, which is situated at Thirty-third and Main streets, is two stories, 50x160 feet, and will cost \$30,000.

The Kissel Automobile Co., Omaha, Neb., the first new firm of the year in local trade circles, has opened temporary quarters at 2016 Farnam street. Ralph Mansfield, H. W. Holtzinger and C. E. Holt constitute the firm which will represent the Kisselcar.

Warburton Bros. is the style of a new firm which has established itself at 172-174 Victoria street, Toronto, Can., and which is handling the Maxwell line. One of the brothers, W. C. Warburton, was for several years in the employ of the Maxwell-Briscoe company.

The L. J. Wells Livery Co., Des Moines, Ia., one of the pioneer equine establishments in the city, have taken possession of a new seven story building on West Eighth street, between Cherry and Mulberry streets, and have taken on automobiles. They have secured the Moon agency.

Motor car dealers in Oklahoma City, Okla., have formed the Oklahoma Automobile Dealers Association with the following officers: John McClelland, president; G. Page, vice-president; Ray Colcord, secretary; Robert H. Mulch, Jr., treasurer, and F. R. Thompson, chairman.

The Wagner-Renliff Motor Car Co., San Francisco, Cal., northern California representative of the Auburn, have established a branch in Oakland, across the bay from San Francisco. It is located on Twelfth street in the heart of the automobile section and will handle all business in Alameda county.

The Des Moines (Ia.) Automobile Dealers Association, which includes all of the 13 firms in the local colony, has been organized with the following officers: W. E. Moyer, president; Dan Patten, secretary; Cheney R. Prouty, treasurer; directors, the officers, T. J. Williams, Harold Wells, and Ross Clemons.

The United Motors Co., Chicago, Ill., representatives of the American and Sterling cars, have leased quarters in New York City and will open an eastern branch in August. George L. Derr and W. F. Gray constitute the firm, which acts as general distributors of the entire output of the Sterling factory.

Harry S. Moore, who has been handling the Stoddard-Dayton car at 1761-63 Cranford road, Cleveland, Ohio, and who just has added the National line, is opening another store at 2034-36 Euclid avenue, in the heart of the downtown automobile district; the new place will become Moore's headquarters and main salesroom.

For the second time in a little over two years fire visited the garage of William M. Whitney & Co., 203 Hudson avenue, Albany, N. Y., on the 14th inst. and gutted the building, eight cars being consumed. Hot coals dropping from heating stoves on the oil soaked floors are said to have been responsible for the blaze.

The Johnson Automobile Co., Boone, Ia., one of the largest establishments in the state, has changed hands. Dr. S. O. Stockslager and Chris Williams, two local men, being the new owners. They will continue the business under the old name and E. R. Johnson, the retiring owner, will remain with the new firm for the present.

The Means Automobile Co., Des Moines, Ia., is the latest recruit in local trade circles and has opened for business at 309-311 East Walnut street. They will push the Moline and De Tanble cars in Central Iowa. George Means, formerly with the Mason Automobile Co., of Des Moines, and Dr. B. Thompson, of Tama, constitute the firm.

The Jacksonville Automobile Co., Jacksonville, Ill., which is composed of twelve business men of that town, all of whom are car owners, has taken possession of its new garage on East State street. It has a storage capacity of 50 cars and includes a well equipped repair shop. The White, Chalmers-Detroit, Maxwell and Studebaker cars are handled.

The Patton-Van Vliet Co., Des Moines, Iowa, has taken possession of its new and elaborately appointed salesrooms and garage on the ground floor of the new commercial college building at West Tenth and Walnut streets. The quarters have a frontage of 66 feet on Walnut street and will include a repair shop. The Studebaker lines will be handled exclusively.

The Superior Motor Co., Calumet, Mich., one of the largest garage establishments in northern Michigan, just has completed equipping its repair plant at Laurium with an extensive complement of machinery of all kinds. In connection they also maintain wood working and upholstering departments. They handle the Peerless, Stoddard-Dayton, Interstate, Security, Overland, Buick and Baker electric in four counties.

**No Piece-Work—No Over-Time  
No Nightwork—No Rush Methods**

**are permitted in the manufacture of**

**WHITE** **Steam  
and  
Gasoline** **CARS**

**Q**UANTITY is the fundamental requirement in constructing White steam and gasoline cars and no manufacturing methods which might endanger quality are permitted in the White factory.

The workmen are paid by the hour—not by the piece—so there is no incentive for them to devote less time and care to any operation than is its due. No over-time work is permitted, because work so done is generally not so painstaking as it should be. We do not employ a “night shift” because in this way responsibility is divided and work done by artificial light cannot be as good as that done by daylight. Finally nothing is rushed through the White factory.

Each operation is allotted the full time necessary to secure the highest standard of quality. For example, thirty-three working days elapse between the time a body is received into the paint shop and the time it is sent to the assembling-room. Similarly, every other operation receives every care which our ten years’ experience in manufacturing high-grade automobiles can suggest.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, JANUARY 27, 1910.

The Chicago Show issues of the Motor World will bear dates February 3 and 10th. They will contain bona fide reports of the show, not reviews of catalogs masquerading as such reports and written weeks before the doors of the exhibition have opened.

### Strenuousness of Snow Travel.

All-weather automobile service has become an accomplished fact. Although, largely as a matter of personal inclination, owners of small and medium powered machines continue to lay them up for a more or less protracted period during the winter months, those who own larger cars, particularly if equipped with enclosed bodies, never for a moment question the advisability of keeping them in commission the year round. It is no longer a matter of doubt that motor vehicles are qualified to negotiate frozen ground, muddy roads and snow successfully. The heavier and better balanced cars seldom even balk at soft and slippery snow, al-

though town cars and particularly taxi-meter cabs frequently are stalled temporarily, owing to the poor traction which it is possible to obtain where the wheels are equipped only with ordinary tires and non-skid chains.

Whatever feeling of complacency this very natural outcome of motor vehicle development may engender, however, is offset to some extent by the admitted fact that the heavy duty which snow travel involves has presented to the automobile manufacturer new and wholly unexpected problems. For strange as it may seem, cars which withstand successfully the long-continued effects of heavy mud-plugging expeditions begin to develop sudden weaknesses when subjected to snow work, even for relatively short periods. A recent and forcible illustration of the point, which serves to emphasize the gravity of the matter, was the return of five cars to an agency for one of the most eminent makes of American machine, after a recent snow storm, each affected with some serious difficulty; twisted shafts, stripped gears and other troubles not ordinarily encountered at other periods of the year, being among the symptoms of strenuous overwork.

The reason for the arduousness of snow travel is not far to seek, when it is considered that in addition to the greatly increased traction resistance which the snow entails, the tires are practically robbed of their adhesion at times, the co-efficient of friction between the tires and the snow-covered road surface, varying greatly even on the same stretch of highway and on the same day. The result is that the driving wheels constantly are liable to slippage, the result being a vast amount of overtaxation for the differential and other gears, while the occasional necessity of racing the engine serves to rack the entire fabric tremendously. In addition to this, the loss of guidance of the front wheels results in throwing the machine about, straining not only the steering gear, but the springs, axles, wheels and frame in a way that seldom, if ever, occurs under other circumstances.

Since the difficulties arising from snow service cannot be localized in any one member, but are distributed over the entire machine, it is evident that no specific remedy for them is to be found; save only that of strengthening the entire machine to a point considerably beyond that which hitherto has been considered necessary for ordinary

service. That such a reinforcement of the fundamental parts of the average machine is absolutely required is rather a grave assertion to make, yet it must be admitted that the ordinary car, even though of most substantial construction, is ill suited to the rough and tumble of long continued snow plowing. The real point is to teach the owner and the average hired driver that cars are not made to withstand the stresses which heavy winter work entails. With cautious handling they will endure all classes of service, but the slam-bang treatment of the would-be "clever" driver, injurious at any time, is particularly harmful when snow is on the ground. That many cars well are worth reinforcing in certain parts, however, is a consideration which a touch of real winter is apt to bring home to manufacturers who otherwise might not have the fact called to notice until the entire output now in the making was well out of hand and distributed among the owners.

### Governors for Commercial Vehicles.

While the use of mechanical governors for limiting engine speed largely has been done away with in the construction of pleasure cars, it is noteworthy that the use of such devices is regarded in an entirely different light by makers who are devoting their attentions to the commercial vehicle problem. Such are the demands upon the engine of the pleasure car, and such the growing intelligence of the average user, that the real need of a governor to prevent racing the engine largely has been overcome. The increasing use of the throttle method of control in driving obviates its need entirely for ordinary purposes, and so it is considered entirely superfluous by most manufacturers.

The commercial vehicle presents in running conditions a totally different state of affairs from this, however. In the first place, it is a prime requisite of motor vehicle work as a business venture, that the mechanism shall be run under as nearly constant conditions as possible, and that the requirement of skill in operating be reduced to its lowest terms. Hence, the governor becomes considerably more desirable in this instance, than in the case of the car which is presupposed to be in intelligent and watchful hands at all times. A more important point, however, and one which has led several commercial vehicle producers already to install governing devices and to place them under seal, is the low

gearing which the business wagon ordinarily is given.

While under load-carrying conditions, there commonly is little risk that the engine will be raced, circumstances change when the vehicle is being returned unladen after a long haul. Under such circumstances the temptation of the driver to make what speed he can is very strong, even aside from his natural inclination to "go fast." This inclination is accentuated, it also may be supposed, if the driver be of the sort which is easily tempted to dally at wayside road houses or at corner saloons, secure in his ability to conceal the delay and make up time on the return trip. Hence, it is a wise provision which safeguards the engine against the overspeeding which otherwise might be indulged in, by the installation of a governor enclosed in a sealed case.

That such provision is found on several of the more up-to-date trucks and delivery wagons, as it has been installed for several years on at least one make of public service cab, is sufficient proof that the importance of the governor is well recognized. That its use is not universal upon vehicles which are intended wholly for business purposes, is not as easily explained. Its utility would appear to be so great as to raise it almost, if not quite, to the dignity of an essential in the commercial field.

Pelham Parkway and the Shore Road, two of the widest and most traveled routes in New York and which are of the few that have escaped the invasion of the trolley, practically have been captured by two traction companies and soon will be torn up and narrowed and made more dangerous by the laying of a double line of street car tracks. Unless those who use the thoroughfares make themselves heard at once, the danger is likely to be made greater by positioning the tracks in the center of the roadway instead of at the sides. Nelson P. Lewis, the city's chief engineer, to whom the traction companies' applications have been referred, is the man to whom protests should be addressed.

Charles Thaddeus Terry's clear-cut exposition of the intolerable conditions to which motorists are subject by reason of illiberal and conflicting state laws ought to "win over" every legislator in whom the sense of justice abides. But justice so often is subordinated to public hue and cry that the hoped-for relief is all too uncertain.

## COMING EVENTS

January 24-29, Portland, Ore.—Portland Automobile Club and Dealers Association's show in Armory.

January 24-29, Detroit, Mich.—Detroit Automobile Dealers' Association's third annual show in Wayne Pavilion.

January 24-30, Washington, D. C.—Washington Automobile Dealers Association's fourth annual show in Convention Hall.

January 28-February 5, Edinburgh, Scotland—Scottish Motor Trade Association's annual show in Waverly Market.

January 29-February 5, Grand Forks, N. D.—Northwestern Implement Dealers' first annual automobile show.

February 1-5, Grand Forks, N. D.—Grand Forks Automobile Dealers first annual show.

February 5-6, New Orleans, La.—New Orleans Automobile Club's annual Mardi Gras speed carnival.

February 5-12, Chicago, Ill.—National Association of Automobile Manufacturers' ninth annual show in Coliseum.

February 8-14, Los Angeles, Cal.—Automobile Dealers' Association of Southern California's show in Grand avenue rink.

February 14-19, Buffalo, N. Y.—Automobile Club of Buffalo's eighth annual show in Convention Hall.

February 14-19, Hartford, Conn.—Hartford Automobile Dealers Association's third annual show in Foot Guard Armory.

February 14-19, St. Louis, Mo.—St. Louis Automobile Dealers Association's annual show in First Regiment Armory.

February 15-17, Washington, D. C.—American Automobile Association's national legislative convention.

February 17-19, Grand Rapids, Mich.—Grand Rapids Automobile Club's first annual show.

February 18-22, Fargo, N. D.—Fargo Automobile Dealers first annual show.

February 19-26, Los Angeles, Cal.—Licensed Association of Los Angeles' first annual show in Hamburger building.

February 19-26, Minneapolis, Minn.—Minneapolis Automobile Show Association's exhibition in National Guard Armory.

February 19-26, Newark, N. J.—Associated Automobile Clubs of New Jersey's show in Essex Armory.

February 19-26, Salt Lake City, Utah—Automobile show in Auditorium.

February 21-26, Binghamton, N. Y.—Automobile show in State Armory.

February 21-26, Cincinnati, O.—Automobile Club of Cincinnati's annual show in Music Hall.

February 21-27, Cleveland, O.—Cleveland Automobile Dealers Association's annual show in Central Armory.

February 22, Los Angeles, Cal.—Los Angeles Licensed Dealers' Association's Pasadena-Altadena hill climb.

February 22-27, Milwaukee, Wis.—Milwaukee Automobile Club's second annual show in Auditorium.

February 24-March 3, Toronto, Can.—Ontario Motor League's show in St. Lawrence Arena.

February 28-March 4, Omaha, Neb.—Omaha and Council Bluffs Automobile Dealers' show.

February 28-March 5, Kansas City, Mo.—Kansas City Automobile Dealers Association's fourth annual show in Convention Hall.

March 5-12, Boston, Mass.—Boston Automobile Dealers Association's eighth annual show in Mechanics Building.

March 5-12, Cleveland, O.—Cleveland Automobile Club's eighth annual show in Central Armory.

March 5-12, Des Moines, Ia.—Des Moines Automobile Dealers Association's first annual show in Coliseum.

March 12-19, Syracuse, N. Y.—Syracuse Automobile Dealers Association's annual show in State Armory.

March 20, San Francisco, Cal.—San Francisco Motor Club's hill climb on Nineteenth avenue hill.

March 21-28, Denver, Col.—Denver Motor Club's annual show, in Convention Hall.

March 26-April 2, Montreal, Can.—Fourth National Automobile and Sportsmen's show.

March 28-29, Savannah, Ga.—Savannah Automobile Club's 675 miles endurance run to Jacksonville, Fla.

April 8-17, Los Angeles, Cal.—Inaugural meet on the new Los Angeles Motordrome.

April 23-29, Bangor, Me.—Eastern Maine automobile and motor boat show in Auditorium.

June 1, Berlin, Germany.—Start of Prince Henry tour, finishing at Homburg on 8th.

June 11, Wilkes-Barre, Pa.—Wilkes-Barre Automobile Club's annual hill climb on Giant's Despair, Wilkes-Barre Mountain.

July 2, Wildwood, N. J.—North Wildwood Automobile Club's roadability run from Philadelphia to Wildwood.

July 4, Wildwood, N. J.—North Wildwood Automobile Club's annual beach races meet on Ocean drive.

August 6, Wildwood, N. J.—North Wildwood Automobile Club's beach race meet on Ocean drive.

September 5, Wildwood, N. J.—North Wildwood Automobile Club's beach race meet on Ocean drive.

**THIRTEEN NEW CARS AT DETROIT**

**That Number Make First Appearance at Local Show—Representative Array of Ripened Productions Also There.**

In many respects most important of the host of local shows, and the apparent climax of its long series of factory enlargements and company productions, Detroit is fairly bursting with automobile enthus-

iasm, the trade show proposition, which has been revived after an unsuccessful attempt at exploitation last year, has assumed more definite proportions than ever before. The movement for holding a purely industrial exhibition there is being agitated with vigor at the show; Mayor Breitmeyer touched upon the subject in his opening address of welcome, it was the theme discussed at the banquet of the dealers' association, and a later meeting to be held sometime during the week, is to be called

Guarding the grand stairway, are two heroic statues of the motor girl of 1910, who is proudly perched on the hood of a touring car, only the fore part of which protrudes from the wall, while she holds aloft an indefinable something, which, be it fish, flesh or fowl, certainly is decorative in intent and in effect. Two statues of "labor" and two more revealing the dignity of "science" also have places of honor in the setting, while the band stand is guarded by a troupe of fierce looking lions, upholding a golden

PICTURESQUE SETTING OF THE DETROIT SHOW

iasm this week, which is to say that the third annual show of the Detroit Automobile Dealers Association is holding forth in Wayne Pavilion; it opened on Monday, and will close Saturday night. In respect to setting and general arrangement, it is reminiscent of former "D. D. A." shows held in the same building, but in bulk of displays, new exhibitors and expectant atmosphere, it exceeds either of the previous shows held in that seething center of the industry. Because the industrial atmosphere of Detroit is surcharged with automobile enthus-

iasm for the express purpose of considering the question of holding a national show, either in the fall of 1911 or sometime during 1912.

As a spectacle, the properties of last year's show are somewhat in evidence, notably in the huge decorative fountain. The general scheme of decoration, however, is distinctive. Green, ivory and gold are the prevailing color tones, while the roof is covered by an illuminated glass dome. The main entrance is shrouded in a smilax covered lattice, the same decorative vine being liberally used in all parts of the hall.

cord in token of their bondage, perhaps.

Local, only in respect to the names of the exhibitors, the show really assumes the proportions of a manufacturers' exhibition, when the number of local producers represented, and the close relationship existing between some of the manufacturing and sales organizations is considered. Nearly three hundred different cars are on view, products of two score and more of makers. To a considerable extent they are of the low or medium priced contingent, though it is noteworthy that the light commercial

vehicle of the delivery type is more in evidence than ordinarily is the case, either at local or national shows.

Among the better known cars not made in Detroit, which are displayed, are the Stevens-Duryea, Pierce-Arrow, Stoddard-Dayton, Mitchell, Maxwell, Stearns, Pope-Hartford, Overland, Haynes, P-S, Thomas, Reo and Jackson. Of the more prominent domestic products shown by local representatives, are the Chalmers-Detroit, Everitt "30," Ford, Brush runabout, E-M-F., Hupmobile, Herreshoff and Hudson "20."

The "tumbling chassis," which was the feature of the Thomas display at the recent Madison Square Garden show in New York City, continues to rotate in dignified distinction. Palmer-Singer, Winton, and Stoddard-Dayton torpedo bodies and others which were the cause of more or less comment at the two big national shows, still claim distinction by reason of their novel characteristics. Sectioned and moving chassis, many of them brought from New York by way of Philadelphia, rule at a large number of the stands.

Among the newcomers, mostly of Detroit manufacture, and hitherto unexhibited, are a baker's dozen of machines. They are the Dearborn-Detroit, Anhut Six, Watt, Van Dyke, Michigan, Whiting, Patterson "30," Krit, Keystone, Warren-Detroit, Beyster-Detroit, and Templeton Dubrie. The Krit, which is one of several machines new to the show, but which have been in the making for some months, is a 22 horsepower runabout, of neat, light and low construction, embodying such modern and approved features as unit power plant, magneto ignition, two-speed selective gearset and a lubricating system incorporating no small originality.

The Anhut Six, also a new comer, which has had some seasoning before the show, is a graceful attempt to produce a standardized six-cylinder machine at a very low price. Its design is compact and pleasing, and its standing locally is assured from the fact that Detroit's own mayor is interested in its production. The Patterson "30" is a four-cylinder car, with unit power plant and other standard features, which is noteworthy by reason of the fact that all working parts are enclosed and protected from the effects of dust and dirt.

Distinguished in its specification of dual ignition by magneto and battery, but embodying the set spark, the Warren-Detroit, one of the brand new cars of the show, also has several other points of merit. Among them may be mentioned the four cylinder block motor, three-speed selective gearset, and 34 by 3½ inch tires, which is the equipment for the small tonneau style. Outwardly, it is built to clean cut, standard proportions. The Whiting "20," is one of the very low prices cars which have recently come into being. It is distinguished by long, sweeping "aeroplane" mud guards, round fuel tank back of the single runabout seat, semi and full elliptical springs front and

back, and is conspicuous at the show in its all-white finish.

Additions to the commercial contingent include the Michigan steam truck, which embodies a most unusual and compact form of steam engine of the quadruple expansion order, and is claimed to lead the way in point of efficiency when using kerosene for fuel; and no less than three light wagons of the gasolene type. Of these, the Beyster-Detroit is driven by a four-cylinder 22 horsepower motor, has magneto ignition and other up-to-date features, and is shown in the form of a covered delivery wagon. The Van Dyke is a 1,000 pound vehicle, with 12 horsepower opposed motor, friction transmission, and pneumatic tires, which is built to sell for the remarkably low figure of \$750. The Templeton-Dubrie is of 20 horsepower, very pretentious outwardly, with open tray body, covered driver's seat and shapely bonnet over the engine, and rated at 20 horsepower. It has thermo-syphon cooling, axle mounted gearset, and is noteworthy for its very low mounted body and easy spring suspension.

The exhibitors, and the cars displayed are as follows:

Anderson Carriage Co., Detroit electric; Anhut-Robinson Auto Sales Co., Anhut Six; Arant Bros., American Simplex and Chalmers-Detroit; Auto Commercial Co., Grabowski commercial.

Bemb Auto Sales Co., P-S; Beyster-Detroit Motor Car Co., Beyster-Detroit commercial; Brady Auto Co., J. H., Peerless, Pope-Hartford and Hudson "20"; Broadway Auto Co., Haynes; Brush Runabout Co., Bruch; Buick Motor Car Co., Buick.

Cadillac Motor Car Co., Cadillac; Cartercar Co., Cartercar; Cunningham Auto Co., E-M-F. "30", Flanders "20", and Studebaker.

Detroit-Dearborn Auto Co., Dearborn-Detroit; Detroit Motor Sales Co., Keystone, Paige-Detroit and Warren-Detroit; Fee-Bock Electric Co., Woods electric; Flint Wagon Works, Whiting; Ford Motor Co., Ford.

Gillispie Auto Sales Co., Thomas Flyer and Reo; Gilmour & Fear Auto Co., Mitchell and Krit; Harper-Aldrich Co., Demotcar; Herreshoff Motor Co., Herreshoff; Keeler-Hupp Co., Hupmobile; Lozier-Detroit Sales Co., Lozier.

McIntosh Co., J. B., Lambert; Maxwell-Briscoe-McLeod Co., Maxwell; Metz Plan Co., Metz; Michigan Motor Sales Co., Oakland and Welch-Pontiac; Michigan Steam Motor Co., Michigan steam commercial; Montgomery Sales Co., American roadster; Neil-Ketchell Motor Sales Co., Parry and De Tamble.

Neuman Co., W. V. F., Stoddard-Dayton and R. & L. electric.

Olds Motor Works, Oldsmobile; Overland Motor Sales Co., Overland.

Palmer Auto Co., Stearns; Patterson Co., W. A., Patterson "30."

Rapid Vehicle Co., Rapid commercial; Regal Auto Sales Co., Regal.

Schneider, J. P., Pierce-Arrow, Stevens-

Duryea and Baker electric; Schulte Garage Co., P. W., Kisselkar; Security Auto Co., Everitt "30"; Seidler & Miner Auto Co., Jackson and Babcock electric; Standard Auto Co., Packard.

Templeton-Dubrie Auto Co., Templeton-Dubrie commercial.

Van Dyke Construction Co., Van Dyke commercial.

Watt Motor Car Co., Watt; Welch-Detroit Auto Co., Welch-Detroit; Winton Motor Carriage Co., Winton.

#### Outline of the Next Glidden Contest.

Doubts as to whether the Glidden trophy would be retained as an object for annual competition were set at rest the first meeting of the new contest board of the American Automobile Association, which took place in New York on Tuesday, 25th inst., which resulted not only in a decision to retain the trophy instead of returning it to its donor, but in the selection of tentative route for this year's contest, with Cincinnati as the starting point and Chicago the finish.

Instead of the 1910 event being styled the "Annual Reliability Contest of the American Automobile Association for the Glidden and Other Trophies," as the more recent struggles have been called, it is probable that the affair this year will be known as the "National Contest for the Glidden Trophy."

Considerable discussion also was given to a plan by which "Glidden certificates" should be given to those contestants who come through the event with a score of 95 per cent. or better. The idea evidently was regarded with some favor by the board, and there is every likelihood of its being incorporated in whatever system of awards ultimately is decided upon.

As at present outlined, the tour is to start in July, and the route through the Southwest and West, which has been selected, is as follows: Starting from Cincinnati, through Louisville, Nashville, Memphis, Little Rock, Dallas, Oklahoma, Wichita, Topeka, St. Joseph, Des Moines, Cedar Rapids, Davenport and ending at Chicago. The distance that this represents is about 2,300 miles, and it is possible that the tour may be shortened in accordance with modifications that will be suggested after the scout cars have gone over the territory.

The meeting of the board was presided over by S. M. Butler, the new chairman, and the others to attend included: Alfred Reeves, general manager of the Association of Licensed Automobile Manufacturers; E. Rand Hollander, of the Importers' Automobile Salon; Joseph H. Wood, president of the Associated Automobile Clubs of New Jersey, and L. R. Speare, of Boston, president of the A. A. A. In addition to the matter of the contest, the board took up a number of other questions before it, including the plan for the appointment of paid expert examiners in the various racing districts which are to be created.

**QUAKERS' SECOND INSTALLMENT**

**First Week's Exhibitors Move Out and "Left-overs" Move in—Who They are and What They Showed.**

With a larger and more varied list of exhibits, the second and last installment of the Philadelphia Automobile Trade Association's two weeks show in Third Regiment Armory was uncovered on Monday afternoon of this week, and the crowds which thronged the hall exceeded those of the first day of the previous week, which may be taken as a possible indication that there was more of general interest to be seen at the

UNDERTAKERS WAGON EXHIBITED AT PHILADELPHIA

last half of the exhibition. Despite the inclement weather during the latter part of the first week, the attendance continued strong, and all the exhibitors expressed themselves well satisfied with the results. Immediately after 11 o'clock on Saturday night the show was transformed into one grand scene of hubbub and confusion, the returning exhibitors starting to remove their displays, while the incoming contingent impatiently awaited the necessary signal to move in.

By working all night Saturday and Sunday the transfer was accomplished, and with few exceptions all of the exhibits were complete on Monday. For the first time commercial vehicles were shown at a Quaker exhibition, and they made an impressive display. There were all sizes from the small delivery wagon to a ten-ton truck, with a wide range of body styles, while the Crane & Breed undertaker's wagon was one that was out of the usual order.

Several of those firms that exhibited at the Armory the previous week held private shows at their salesrooms this week, as did others who were unable to secure space for either week. The list of exhibitors follows:

**Pleasure Cars**—North Philadelphia Automobile Station, Knox; B. C. K. Motor Car

Co., Kline; Motor Supplies Co., Empire; Imperial Automobile Co., Imperial; The Autocar Co., Autocar; Springfield Motor Car Co., Springfield; Haynes Automobile Co., Haynes; E-M-F and Flanders Agency; Studebaker Brothers Co., Studebaker; Otto Gas Engine Co., Otto; Collings Carriage Co., Rainier and Waverley; J. C. Bartlett, Woods; J. C. Parker & Son, Detroit; Westinghouse Electric and Manufacturing Co.

**Commercial Vehicles**—The Autocar Co., Commercial Truck Co., Mack Brothers Motor Car Co., Martin Carriage Co., Studebaker Brothers Co., Packard Motor Car Co., General Vehicle Co. and Collings Carriage Co.

**Motorcycles**—C. V. Stahl Motor Works, C. V. C.; Stoddard-Dayton Automobile Co.,

**KANSAS CITY SHOW BIG SUCCESS**

**Representative Display and Large Crowds Reward "Insurgent" Dealers' Effort—New Vehicles in Evidence.**

Inaugurating the local show season for 1910 the first of the Kansas City (Mo.) motor car exhibitions under the auspices of the Motor Car Trade Association of Kansas City was opened in Convention Hall, the city's largest building, on the 17th and "played" to crowded houses daily, the "engagement" terminating on the 22d. In number of exhibitors, decorative effects and attendance, this first effort of the youthful and "insurgent" organization surpassed all previous local shows. The striking feature of the decorations on which the sum of \$5,000 was expended, was the Japanese tea garden, of double deck construction, at the far end of the hall. It was illuminated with hundreds of electric lamps and shrouded with posies.

The main color scheme was blue and purple, while the roof was concealed by a canopy of blue and white. Around the walls was a huge panel containing 25 reproductions of western prairies scenes most of which were the work of the late Frederic Remington. Large arc lights furnished the initial illumination on the main floor, supplemented by hundreds of incandescent bulbs. The center space of the main floor was divided by a green hedge and a wide walk encircled the whole section. In the arcade where the commercial vehicles held forth the principal decorations were blue and white bunting, which was strung to the roof and descended to the opposite side of the hall.

Including all types of vehicles there were some 49 different makes, representing a total of 175 cars. The main floor was given over exclusively to pleasure cars, while the overflow from this division was located in the arena, where also some of the commercial cars were placed; others of these found space in an enclosed section near the entrance while the accessory men held forth in the balcony. Of course there were the usual late comers on the opening night, most of whom were held up by transportation delay, but on the second day the belated exhibits had arrived and the show was complete. Many of the exhibits included a polished chassis, while a few others showed sectioned engines and other parts for the education of the visitors and those always had their quota of interested spectators. And, too, there was a brave display of trophies won in local contests during the past year, which proved strong attractions at the booths of their owners.

Of the cars on exhibition, two, the Cino and Parry, made their debut at a show. The first mentioned, which takes its name from a combination of the names of the city and

New Era, and George W. Reinbold, Yale.

**Accessories**—Charles E. Miller, supplies and accessories; John A. Salman, name plates and monograms; Ernest Flentje, shock absorbers; Paul & Herst, supplies and accessories; Hydraulic Oil Storage Co., storage systems; Rose Manufacturing Co., Red Star Oil Co., Penn Auto Supply Co., Home Tire Co., Consolidated Rubber Tire Co., Howard Demountable Rim Co., James L. Gibney & Bro., Auto Equipment Co., Britson Manufacturing Co., J. H. McCullough & Son, Lyon Non-Skid Co., Puritan Soap Co., George W. Nock Co., Auto Light and Motor Supplies Co., William Sanford Co., Keystone Lubricating Co., Philadelphia Storage Battery Co. and Perfection Wrench Co.

**Automobile Line for Honduras.**

According to the report of the Belgian Minister at Honduras, Central America, the Honduran government is building a 75 miles macadam road from San Lorenzo (on the Pacific) to Fegucigelpa, and intends to establish a regular automobile transportation of passengers and freight on this road. This would seem a promising field for some energetic American manufacturer to investigate, although results are likely to be slow in forthcoming.

## WASHINGTON'S REVIVED SHOW

**It Proves More Attractive Than in Its Predecessors—Two Near-Native Cars Add Interest.**

state in which it is made—Cincinnati, Ohio—is built by an old carriage concern, Haberer & Co., and follows conventional lines, employing a four cylinder 40 horsepower motor with valves in the head, multiple disc clutch, selective transmission and enclosed shaft drive. The frame is upswept in the rear and carries three-quarter elliptic springs, while semi-elliptics are used in front. Axles both are of Timken make, the front being of I-beam pattern and the rear of pressed semi-floating construction. Wheels are 34x4 all around, and the wheel base of 112 inches.

Hailing from Indianapolis, the Parry is the product of the old carriage firm of that name. It also is an exponent of the valve in the head motor of the four cylinder type, and which is mounted on a sub-frame, which is welded to the main frame. Final drive is through an enclosed shaft. Springs are semi-elliptic front and full elliptic rear.

Two new commercial vehicles also made their appearance, one the product of the Avery Farm & City Tractor, the other the product of the H. E. Wilcox Motor Car Co., of Minneapolis.

Beginning with the opening night when the building was crowded to capacity from the time the doors were opened until the lights went out, the attendance held strong throughout the show and all previous local records for attendance were broken. This accomplishment largely was due to the excellent weather which prevailed throughout the exhibition. Following were the cars exhibited and the firms showing accessories:

## Gasolene Cars.

Apperson	Oakland
Badger	Ohio
Buick	Oldsmobile
Cadillac	Packard
Chalmers-Detroit	Parry
Cino	Paterson
Columbus-Firestone	Peerless
Corbin	Pierce
Courier	Regal
Crawford	Reo
Fiat	Royal Tourist
Ford	Staver
Hudson	Stevens-Duryea
Hupmobile	Stoddard-Dayton
Inter-State	Studebaker-Garford
Marmon	Studebaker-E-M-F
Maxwell	Studebaker-Flanders
Mitchell	Thomas
Moon	Velie
Mora	Welch

## Electrics.

Babcock	Rauch & Lang
Broc	Studebaker
Columbus	Waverly
Detroit	Woods
Fritchie	

## Commercial Trucks.

Avery	Rapid
Chase	Reliance
Frayer-Miller	Studebaker
Packard	Wilcox
Granm-Logan	

## Accessories.

Pioneer Auto Top Co., Holcker-Elberg Mfg. Co., Kansas City Vehicle Co., Fidelity Oil Co., Moriarty Auto Supply Co., Sireno Horn Co., Uncle Sam Oil Co., and the Columbian Steel Tank Co.

Electric Vehicles—Motor Sales Co., R. & L.; Wilson Co., Woods; Pope Automobile Co., Waverley; Cook & Stoddard Co., Baker; Washington Motor Vehicle Co., delivery wagons, and Commercial Auto and Supply Co., Studebaker.

Accessories—Miller Bros., supplies; National Electrical Supply Co., accessories and supplies; Baltimore Buggy Top Co., tops and curtains; Standard Oil Co., lubricants; Wayne Oil Tank & Pump Co., tanks and pumps; Electric Speedometer & Dynamometer Co., speedometers; R. Milton Norris, tops and accessories, and Patuxent Lumber Co., portable garages.

## Oakland Show Exceeds Expectations.

For their maiden effort the Oakland (Cal.) Automobile Trade Association's first annual show, which was held in Piedmont Pavilion, from the 16th to the 23rd inst., surpassed expectations and proved one of the most successful motor car exhibitions ever held on the coast. While in former years Oakland has had what were termed automobile shows, they were combined with some festival or similar function which partly detracted from their glory, so that this was the first year that the show was held as a separate function.

There were some 55 different makes shown, comprising a total of over 200 machines. Coming at a more opportune time when many more of the 1910 models were ready, the Oakland exhibition embraced about 33 cars which were not shown at the San Francisco exhibition last October, during the Portola celebration. Following is a list of those who exhibited:

Gasolene Pleasure Cars—W. L. Loos & Co., Stoddard-Dayton and Reo; Pullman Automobile Co., Pullman; Hugo Muller Auto Co., Moline and Premier; Auburn Automobile Agency, Auburn; Maxwell Auto Agency, Maxwell; Reliance Auto Co., Knox; Palmer-Singer Auto Co., Palmer and Singer; Locomobile Co. of America, Locomobile; Jones Automobile Co., Regal; Studebaker Brothers Co., Garford, E-M-F and Flanders; Elmore Auto Agency, Elmore; Western Electric Vehicle Co., Kisselkar; Haynes Auto Sales Co., Haynes; Tallman & Stephenson, Overland and Sunset; H. O. Harrison Co., Peerless, Selden and Everitt; Rambler Auto Agency, Rambler; Oldsmobile Agency, Oldsmobile; Buick Agency, Buick; Pacific Motor Car Co., Stevens-Duryea; S. G. Chapman, Oakland and Hupmobile; Consolidated Motor Car Co., Pope-Hartford; Pioneer Automobile Co., Thomas Flyer, Chalmers-Detroit, Hudson and Randolph; Cartercar Agency, Cartercar; White Co., White, steam and gasolene; John J. Bunting, Jr., Franklin, and Corbin Auto Agency, Corbin.

Electric Vehicles—Studebaker Brothers Co., Studebaker; Western Electric Vehicle Co., Detroit and Waverley; McDougal Mfg. Co., R. & L.; Bay Cities Electric Co., Columbus; Pacific Motor Car Co., Woods, and Pioneer Automobile Co., Babcock.

## FURTHERANCE OF THE COMMERCIAL VEHICLE

### Importance of Trained Men and Proper Maintenance To Its Complete Success—How Such Men May Be Trained and Their Usefulness Demonstrated—Selling Campaigns As They Have Been and Should Be Conducted.

Much has been written and said on the subject of the commercial vehicle, I know, and the fact that many of our leading automobile manufacturers today are engaged with no uncertain success in supplying the at present limited demand for this class of vehicle, is an indication of future possibilities. But it nevertheless remains a fact that we are producing nearly 18 pleasure vehicles today to one commercial, and this, in view of two already established facts: a great world's commerce increasing in normal times faster than the facilities for handling it; and the closer drawn competition in the pleasure vehicle of all classes, already pointing directly to the future "firing line," where only the fittest will survive.

To sum up so far: Is not the industry at a point in its history where some disastrous consequences can be expected in certain quarters unless a balance can be struck to put it on an even keel by providing further outlets for the almost frenzied energy of production that we are witnessing? And right here it seems to me looms up the commercial problem, large and strong.

"Why problem?" will be asked. I do not know that there is any problem connected with this subject, but there are certainly some new factors to be reckoned with by comparison: Technical differences of construction for one thing, which can be discussed later, as I want to move quickly to my main subject.

The selling forces of all the great producers today are arrayed chiefly for pleasure vehicles. While the supply of ammunition is getting pretty short in some localities, and the stock arguments are becoming a little seedy in spots from being trotted out very frequently—the individuals are all there, basing their hopes and working their claims on one known definite factor, the love of the average American of means for pure, wholesome, outdoor enjoyment, recreative and health-bringing, coupled with a desire for making "short-cuts" in life—energy and time-saving, personal transportation. It is a good thing for the industry that this factor has not been judged incorrectly so far. Where pleasure is involved price is not the first consideration. Many a man today capitalizes pleasure in no uncertain terms. "So and so bought a car of certain make two years ago," we hear. He had lots of trouble at times with it (due more to his own ignorance than any fault of the maker) and the expense has been just so many dollars more than he thought it would be.

But, "look at the pleasure we have had out of it—the good health, etc." This is familiar to us all. Here is capitalization of pleasure as a financial offset. It goes, and furthermore it repeats itself and will continue to repeat itself forever.

But let us throw a new slide on the screen. A big business corporation, its officers counting with exactitude every cent incoming and outgoing, guided by clear cold mathematics in every move they make, were induced two years ago to discard a portion of their horse-drawn teams, without which their business would come to a standstill just as certainly as if the trunk lines refused to haul their freight. They were induced by some commercial vehicle salesman to substitute a motor truck on the arguments deduced from a hastily prepared mathematical program. The figures looked good, and the salesman talked better. They could "easily operate as they were operating." The use of the self-propelled vehicle would require little or no change in their traffic arrangements. It would slide into a fit in their existing system so easily that it would never be noticed, except in the saving of so many men's work at so much per day, and the feed and care of so many horses on a like basis.

But at the end of a year they had had some trouble with the innovation, and trouble spelled expense that was overlooked at the start, and the clever young mathematical sharp in their accounting force to whom had been assigned the particular business of keeping tab on that particular experiment, brought in a report with ever so slight a balance on the wrong side! Will that corporation capitalize pleasure at being the proud possessor of a motor-driven truck, or even some advertising gained by having its name paraded through crowded streets on a self-propelled vehicle? It is to be guessed not. Real live business managers are after dividends, and what doesn't produce dividends—well, must be lopped off or cut out.

I expect to hear someone say, "writing this article you have in mind some exaggerated or unfortunate case." Not so. I am merely presenting what I know and believe can easily become and is in some cases to my definite knowledge the normal result of exploiting the commercial vehicle—if some very clear understanding of the differentiation to be employed in the sale of the commercial vehicle as against the pleasure vehicle, is ignored.

Having previously dismissed technical differences in this article we might as well consider a very apparent phase of the sale of the commercial. Let us first approach the suppositionary case above described along new lines of attack and selling method. To begin with we will assume that in this age it is a fairly easy task to get the "lead," for if "a better mouse-trap" will lead the world in "a beaten track to your door even though you are in the wilderness," so will any idea that will advance dividend-producing conditions even one notch, be received in almost all business quarters with consideration. Suppose Mr. Commercial Vehicle Salesman had prefaced his reply to the inevitable first query of cost and maintenance with the proposition that this prospective business customer try first to look at urban transportation in a systematic light, much as it departmentizes and systematizes other phases of its corporate organization. He would begin by sizing up the total amount of traffic and the complete change from horses to motors. Then he would and could frankly say that success for the undertaking would lie not in substituting so many cars for so many horses and their drivers, but in the economical and efficient operation of a "traffic department," or "freight operating department," or whatever it might be designated. He would not hesitate to ask this corporate customer to create such department with an efficient, well trained man of proven mechanical ability and integrity at its head as superintendent, with a salary commensurate with the position—and manifestly not computed on the basis of the wage scale of shipping clerks, teamsters and the like.

Asked where such a man could be found the salesman would be ready to state that his company had a "school" of men for that purpose. That this "school" was not located in the top floor of some city office building, nor did its curriculum consist of some "correspondence" nonsense, but that its headquarters was at the factory where the vehicles under discussion were built. That these men were first "picked," and then trained as extra help at the factory, and after a certain period of proven ability were optionally "sold" with the cars as competent. The salesman went on to suggest full scope of a reasonable amount of executive capacity and autonomy in the new appointee. Offered with the man a "system of operation," first formulated and tried out at the factory and which could not fail to

make good if practiced, said "system" to involve at once the establishment of garage and shop facilities adequate to the purchase contemplated, which garage and shop facilities would include machine tools and power carefully designed by the manufacturers in a detailed plan to insure proper repair and maintenance under the supervision of the aforesaid superintendent of motive power. He then proved on paper by the same mathematical process that condemned the motor truck in the first instance that all of the above was first, necessary, and second, not prohibitive in cost of initial outlay. That it would, roughly speaking, be so proportionated by its authors that it would never exceed in first cost the price of one extra vehicle of the class considered—exclusive of rent and real estate charges, which have to be borne anyway, horses or motors. Shown in this plan was every detail of the system—the hiring of the drivers—where and how they can be educated and recruited. Showed that although the salaries paid, including the superintendent's, make an unfavorable array at first glance, the grand total is not so much more owing to the total reduced number of employees required to handle the traffic under the new conditions. Showed how tremendous the gain was in fuel and lubrication for the motors over feed and shoeing for the horses, and that everything was in the balance of favor for the motor-driven, except, that one great hoodoo, the mechanical repair. And then, in summing up, he showed in detail just how the factory management would educate the buyer up to the handling of this problem in much the same way that a well-organized railroad company handles its mechanical and operating departments.

After this deliberate exposition is it to be supposed that any responsibility for failure to save costs or improve the transit facilities will fall on the manufacturer? But even here this scheme or system does not release its grasp on that particular customer's wants and needs. The manufacturer will continue to send at stated intervals, say once a month, the same well-trained salesman or other qualified representative to the customer's traffic department in an advisory capacity, to impart new information, see that the system is adhered to, locate defects and leaks, in short do anything and everything to better or maintain a high standard of service.

Coupling this with what every car builder knows he ought to perform under his relation as seller, i. e., give prompt and efficient supply of parts for renewal at fair prices and not at robber rates, would not the newly created "traffic department" yield a successful return in a reasonable period? Can there be much doubt on this point, after recalling the loose, slipshod, unsystematic method not a few of the earlier purchasers of commercial vehicles were wont to employ, chief of which was the housing of their business vehicles in garages and under garage systems designed for

pleasure vehicles, and which even in this year of the industry are so defective from many points of view as to be a fruitful source of discussion among automobile clubs and motorists generally.

Right now an objection in many minds who have studied this situation carefully will present itself against this plan. "It is nice in theory—it is sound and based on sound business principles, but it is laid out in embryo for only large surplus capital to employ!" "How about the 'littler' business, corporate or individual, to whom the investment in a single motor-driven vehicle is a matter of supreme financial effort?" This is another phase of the case, one that is a corollary to the manufacture and sale of the multitude of low priced pleasure cars, and their purchase by an almost unlimited number of persons of moderate means.

It is not the intention of this article to evade it, even though it can be dismissed without elaboration of detail. There are certainly fixed limits to all our efforts along any line, mechanical or otherwise. It can safely be said that there will be a certain fairly definite financial limit to the universal substitution of motor vehicles for horse-drawn in business fields anyway. But of this I am positively certain—that the application of some such system as I have outlined can be made in carefully proportioned and regulated detail to apply just as efficiently and economically to the "corner grocery class" as to the larger business interests, which have perhaps, no greater need for the inevitable change, but who of course have the financial strength to compass it immediately.

The time is surely coming in this country, where unless our present liquid fuel supply fails us, the horse will be more and more relegated to the background of antiquity, and when a horse-drawn vehicle employed in commercial activity will be an anomaly. But I have witnessed already a number of commercial vehicle failures, not viewed so much in the sense of the manufacturer, as from the experience of the user, and based as near as I could judge from an inadequate conception on the part of the buyer of not so much the change of the vehicle itself, but of the change of methods injected thereby in a well-grooved business. It is always a risky thing to attempt to change business methods that are fairly successful, and it is probably the most delicate subject in the world to broach to any fairly successful business man. Knowingly or unknowingly no business man likes to be told that his methods are wrong, or that the injection of a little "system" will help increase his business or success, even though he may be squarely on the lookout for new ideas.

This is a part of the commercial vehicle salesman's work and in how he encounters it and overcomes it will rest largely the success and speed with which we retire the horse from the business world.

The greatest argument the salesman has to overcome in any line is high price. The only way to overcome high price or first costs in the commercial vehicle field is to take into consideration first, not quality or quantity by comparison with other makes, but the change of system the new vehicle will bring about, and how this change will compare in cost and advantage with the existing horse-drawn methods and then the usual comparison of quality and quantity of make vs. make. A motor vehicle at \$300 might be dear or cheap to some business houses. The \$300 does not tell; neither does the vehicle in the first analysis. The system of operation tells and then in the final analysis the vehicle itself.

It has taken ten years of the industry to really bring the commercial vehicle up to a point of efficiency corresponding to that reached by the pleasure vehicles at least five years ago, but from now on we have nothing to fear on this score, as anyone can attest who has witnessed the way the motor trucks in our cities have behaved while hauling their loads through the sleet, snow and ice brought by the recent storms of the winter season.

Just as the freight traffic of today yields the major part of the profits of the railroads, as surely will the urban freight traffic of the future pay in no uncertain measure an ever increasing dividend to automobile manufacture, ownership and operation.

WINTHROP WAITE.

#### New Steam Truck from Michigan.

Considerable ingenuity is claimed for the latest product of the Michigan Steam Motor Co., Pontiac, Mich., which is a steam engine of the quadruple expansion type, and built to develop a large amount of power, relatively speaking, from a very small bulk of plant. The 20 horsepower size, which, as produced for automobile truck use, is claimed to be capable of withstanding a 100 per cent. overload when running at 900 revolutions per minute, is described as "non-centering, without fly wheel," and as consisting of "two nests of four cylinders each, placed at right angles to each other."

"These nests are made up of a high pressure and first intermediate cylinders controlled by high pressure, hollow piston ringed valve, and a second intermediate and low pressure cylinders, controlled by hollow piston ringed valve. All four pistons of each nest operate by way of two stems on one cross head. These by way of a single connecting rod to the driving part of shaft, to which is attached a balance weight." While designed for general power purposes where small units are desired, they are also being installed in a truck produced by the Michigan Co. Under test, the engine is said to consume  $3\frac{1}{2}$  gallons of kerosene oil and 16 gallons of water "to deliver a uniform power of 50 horse for one constant hour; actually delivering 26 $\frac{3}{4}$  per cent. of the heat units in horsepower directly at the driving shaft of the engine."

## HOW PRODUCTION HAS INCREASED

Licensed Association Supplies Figures and a Chart Showing Growth—Last Year's Increase 130 Per Cent.

Because of the opening of the books which was made necessary in the case of all the companies now licensed under the Selden patent, the total production figures of these concerns for the past seven years has

"It must be remembered," the compilers assert, "that the 94,891 cars indicated are authentic beyond all dispute, while the 20,000 estimated as the production of the outsiders and beginners is considered conservative."

More forcible even than the mere statement of the figures as showing the immense increase in production by the licensees which took place in 1909, is the graphic chart which is given herewith and which by means of the heavy black line reveals

13,724. An increase of 51 per cent. took place in 1905, the output being 20,787. In 1906 it was 29,320 cars, representing a 41 per cent. increase, while 1907 showed 34,568 cars, an increase of 18 per cent. over the previous year. The production in 1908 was 40,379, an increase of 17 per cent., the record concluding with the 130 per cent. increase in 1909, with its 94,891 cars, making a total of 244,245 cars produced by the present licensed manufacturers in the seven years.

That the issuance of the figures is less for the purpose of the self-glorification of the A. L. A. M. than to give pause to the manufacturers is indicated by the comment on the statistics.

"The figures indicate very clearly," it is observed, "that production has reached a point that warrants at least a careful look into the future by the makers. There is nothing on the business horizon now to indicate that the present year will be anything but a prosperous one for the motor car builders, yet the figures shown on the chart, prepared and issued by the Association of Licensed Automobile Manufacturers, are deemed worthy of the deepest thought."

### The Way of Taxicab Drivers.

Public motor cab companies which are alarmed at the rapid depreciation of rolling stock during snowy weather, perhaps might find it advantageous to make close observation of the methods of some of their drivers and frame their restrictions accordingly. Following a recent snow storm, a little red cab was observed buzzing away furiously in the middle of a snow pile on a side street in New York City. After watching the driver sawing away frantically from reverse to forward speeds, while an obliging postman repeatedly fed under the spinning wheels a shred of torn carpet taken from the interior of the cab, a bystander ventured to suggest that possibly a shovelful of ashes from a neighboring can might be helpful. To which the cabby replied with scorn:

"Hell! If we wanted to waste time looking for cans we could shovel ashes all day."

### New Use for the Glass Hood.

In order to give a public demonstration of the operation of the engine and its new cooling system, George E. Messer, manager of the H. H. Franklin Mfg. Co.'s Syracuse (N. Y.) branch, is driving about the streets of that city with a Franklin car fitted with a hood made of glass, instead of metal, an idea which hitherto has been confined to exhibition halls. The interior of the hood is illuminated by means of a series of electric lights, and when standing in the city streets, especially during the evening, the car always is surrounded by a crowd of curious spectators. The engine on such occasions is allowed to run while the car is stopped, so the crowd get a visual demonstration of the operation of the air cooled motor.

A. L. A. M. CHART SHOWING INCREASE OF PRODUCTION

been made available, and a computation just prepared by the Association of Licensed Automobile Manufacturers discloses that during 1909 the output of the present Selden licensees alone reached the enormous figure of 94,891 cars. The compilers have added 20,000 cars as the product of the unlicensed companies, making a total production of 115,000 cars, in round numbers, for the past year.

the rise in a manner which strikes the eye. The jump which is shown in the past year represents an increase of 130 per cent. over 1908.

The chart, which applies only to the production of the present licensed makers, is made up from the actual records and is in no sense an estimate. In 1903 the production of these makers was 10,750 cars, and in 1904 there was a 30 per cent. increase to

Representative American Automobile Factories.

**MOTOR TRUCKS FOR SNOW REMOVAL**

**One of Them Gives Practical Illustration of Superiority Over Horse Drawn Vehicles—Work It Performed.**

The work of removing the last fall of snow from the streets of New York furnished a striking example of the efficiency and earning capacity of the modern motor truck, as compared with the horse-drawn vehicle. In order to expediate his task, William N. Edwards, commissioner of street cleaning, secured the services of a White three-ton gasoline truck and put it to work side by side with the horse drawn wagons so that the comparison between the two

Again, all of the teams traveled in a beaten track. If one team was delayed, all those behind it were halted. The motor truck, under such conditions, would simply pull through the drifts at the side of the road and pass around the stalled teams. Furthermore, the efficiency of a two-horse truck gradually diminished as the day advanced, while that of the motor truck was unchanged. If it had been desired, the White truck would have been kept in service for 24 hours a day employing another chauffeur, while the hours of service of the horses were necessarily limited.

**Diamonds Used in Motor Car Manufacture.**

That diamonds are used in the making of automobiles is a fact known to but few of those familiar with the finished machines.

**REACHING THE CAR OWNERS DIRECT**

**"Consumers' Corps" as Used in the Co-operative Selling Arrangement of Five Makers—Results Obtained.**

An actual try-out having been given the unique selling campaign instituted by the United Manufacturers, Inc., for the purpose of reaching retail buyers, the originators of the plan are prepared to pronounce it an entire success, the results obtained from the traveling "consumers' corps" being of a kind to prove a surprise even to those responsible for the idea as applied to motor car accessories. The first test of the plan was made in New England, in such towns

THE WHITE TRUCK EN ROUTE TO AND AT THE DUMPING DOCK

might be based on similar conditions of service.

The official figures of the Street Cleaning Department show that the White truck did at least four times the work of the ordinary two-horse truck. First of all, the motor truck carried 10 cubic yards of snow as compared with 5 cubic yards carried by the ordinary contractor's wagon—such as a brick cart. The motor truck was loaded at Union Square, made the trip to the dock at the foot of East Eighteenth street, was unloaded, and returned to Union Square in an average of 40 minutes, while the best recorded time for a two-horse truck was 1 hour and 20 minutes. The rate paid by the city was 36 cents a cubic yard, so that the White truck earned \$7.20 while the best of its horse-drawn competitors was earning \$1.80.

If the average performance of the two-horse truck was considered, the comparison in favor of the motor truck was even better. At frequent intervals, horses would fall down and it was a matter of no small time and labor to get them on their feet again.

Nevertheless several hundred dollars' worth of diamonds is included in the material periodically bought by the purchasing department of the H. H. Franklin Mfg. Co., in the making of the Franklin cars. The average person who knows that jewels of various degrees of hardness are used for the more important bearings in watches, might be led to infer that they fulfill the same purpose in Franklin motor cars. The Franklin publicity man makes haste to explain, however, that they are used for the truing of emery wheels. The diamonds are large, but they are of an inferior quality, being known as bort diamonds. A large number which the Franklin company recently ordered were imported from Asia. They have a faint sparkle, although they are uncut. A radiating crystallization destroys the value of these diamonds as ornaments, because they will not take a polish, but it fits them particularly for cutting and grinding work, as they will not crumble. They are harder than emery and will cut it, but are slowly worn away in the process of truing the wheels.

as New Haven, Hartford, and Springfield, and according to John E. Bruce, the sales manager, the returns considerably exceeded the most optimistic expectations.

As was fully explained at the time of its organization, the United Manufacturers, Inc., is a combination of the selling departments of five automobile accessory manufacturers, including the Jones Speedometer, C. A. Mezger, Inc., the New York & New Jersey Lubricant Co., the Weed Chain Tire Grip Co., all of New York City, and the Connecticut Telephone & Electric Co., of Meriden, Conn. These co-operatively share in the expenses and the benefits of the selling campaign which the United Manufacturers conducts for them all alike.

By far the most radical feature of the co-operative arrangement which is involved is the putting out of a "consumers' corps," the function of which is to "cash in" on the newspaper advertising which is done in each town on their route, supplementary to the \$60,000 which is to be spent during the year in the automobile papers and the magazines and a like sum for catalogs and other spe-

cial sales literature. In an interview explaining the workings of the corps, Bruce goes very fully into the means and methods which the United Manufacturers is employing. He says:

"These consumers' corps are something new, I believe. There will be three of them: one to operate along the Atlantic Coast, one to cover the territory from Chicago to the Gulf, and a third to work in the Coast cities. Each corps is made up of ten hustling men and a manager. Only consumers' corps No. 1 is as yet doing actual field work.

"To show you just how a corps goes to work: The men go into a town to remain a week. They call upon every dealer and all the automobile owners, explaining the line handled by the United Manufacturers. They go after business hard—we don't keep a lazy or a dull man long. As soon as they strike a city, they arrange for a show of our goods at the rooms of a leading automobile dealer. The automobile owners are urged to inspect it, and it is made very plain to all of them, as well as to the dealers, that the goods are to be sold by every reputable dealer. Indeed, each automobile owner is asked the name of his dealer, and that dealer, if he is square and not a price-cutter, is henceforth one of the units in our marketing machinery. Every other day a full page advertisement is taken in the best of the local dailies, talking about our line. You see that while a consumers' corps is in a town and stirring up interest, this advertising makes possible an immediate cashing in. The corps and the advertising run alongside and are planned to be of equal aid in creating local buying. When a corps moves on, so does the newspaper advertising. Within a year we expect to cover the larger part of the country, certainly all of the important towns, in this manner.

"From the time our advertising begins to create interest, the consumer will be figuratively escorted to the shop of his dealer and there will be made to understand that the dealer is with us because we insist upon giving a square deal to himself and to the consumer. Each dealer will be provided with a large lettered sign, in black and orange, to be hung in the front of his store. This sign is identical in shape and design with that we are printing in all our advertising.

"In New Haven, where we spent one week, we turned over to the dealers 565 separate orders from consumers for our lubricants alone. The consumers' corps is not a theory, it's a mighty successful fact. Naturally, the expense would be impossible to any one manufacturer, but division by five is the pleasantest sum I have to do.

"By the time one of these consumers' corps has gone through a town every dealer and every owner has come to realize three points that are all important in our campaign: First, that we try to reduce the cost of our product to the consumer; second, that we protect the honest dealer in every way

possible; third, that we are enemies of the shoddy dealer and the price-cutter. Our advertising will urge that prices must be maintained if quality is to be assured."

#### New Firestone Sidewire Flange Tire.

After almost three years of more or less private trial on dozens of motor trucks, a new commercial vehicle tire is being offered publicly for the first time by the Firestone Tire & Rubber Co., of Akron, O. It is

known as the Firestone side-wire flange tire, and although it resembles the regular side-wire tire it is distinguished by the addition of the flange attachment for fastening to the wheel, in the manner indicated by the accompanying illustration. A further point of difference lies in the fact that the side wires, instead of being round, are four-sided, and they are vulcanized in the tire instead of being applied to it on the wheel. One compound of regular Firestone rubber stock is used throughout, with a view to providing a maximum of resiliency and long wear.

#### Compound Pump with Advanced Features.

When "compound" tire pumps first began to make their appearance among the automobile accessory offerings they presented the possibility of obtaining so high

a pressure at such a small expenditure of effort that they seemed almost to cheat the laws of physics, but the contrast they presented with single acting pumps has since been matched in a degree by the improved forms of compound pumps over the earlier types. The most advanced form to be put on the market is the 1910 Stapley, manufactured by the Bridgeport Brass Co., of Bridgeport, Conn., and which incorporates

a number of features indicating the thoroughness with which the makers have taken all the requirements into consideration. The cylinders are of rustless, seamless brass and the air intake is at the top of the pump, so that neither dirt nor dust is drawn in. To provide a positively non-leaking joint, the pump cylinder is fastened rigidly to the foot base. On one model there is a pressure gauge at the top of the cylinder, to show the inflation pressure in the tire, and the pumps are provided with an automatic valve opener which allows the tire valve to close without loss of air.

#### Basic Principles of Car Washing.

The man who thinks well of his car sees that the vehicle is washed every time it has been in use, and unless one has fullest confidence in the man who is doing this work, it is well to watch him until one knows just what he does and how he does it, says A. B. Barkman, of the Maxwell-Briscoe Motor Co.

There are many ways of washing motor cars, but one wants to have the finish preserved and not damaged by the ignorance of the hired man. Washing is an exceedingly simple matter, but no end of damage can be done by carelessness. Warm water, not hot, a soft carriage sponge and a chamois skin are necessary.

It is well to avoid the use of soap so far as possible, as many brands contain alkali to a greater or less extent, and the alkali, if the use is continued, will attack the varnish and cause it to become dull.

By applying the water where the mud has accumulated, this will become softened and carried off, which will prevent the grinding of the mud into the polished surface and making scratches and dulling the finish.

If a hose be used, the full pressure of the water should not be allowed because of the grinding effect of the water and mud, and care should be taken to prevent the wiring, the batteries, the coil, and especially the magneto, from becoming wet, as this may cause serious ignition trouble.

After the vehicle has been made free from mud and rinsed clean, the car should be wiped dry with the chamois skin, and when thoroughly dry it can be given a brilliant polish by using a mixture of one part of turpentine and two parts of boiled linseed oil, a small quantity being placed on a piece of waste and applied. Then the polish can be given by means of a piece of dry waste, which will remove the mixture and leave the car handsome and shining.

#### Headlights Only for Country Travel.

Drivers of experience agree that for night driving in the country the use of the headlights alone is most advantageous. If the dash lamps as well as the headlights are lighted, confusing reflections from the metal work on the hood and even from the backs of the headlights are apt to be caused, rendering it difficult to see the road plainly.

## ORIGINALITY IN THE GLIDE CARS

Wherein Those Peoria Productions Differ from Others—Nothing Suggestive of "Assembling" in Their Make-up.

Enjoying the rather unusual distinction of being produced almost entirely in a single factory, instead of being assembled from the products of independent parts makers, the revised and improved line of Glide cars

price, which are correlated, the differences between them are slight. The wheel base of the roadster and Scout is 122 inches, while for the semi-racer, which is purely a speed car, the base is reduced to 106 inches. The spring suspension uniformly is of the semi-elliptic order insofar as the mounting of the front portion of the machine is concerned. The rear of the touring and semi-racer machines also is semi-elliptic, but the roadster and Scout models have the popular three-quarters elliptic suspension in

ed on the top of the pillar which thus is formed, and which, by reason of its construction, lends itself well to the purposes of lubrication. Save for the magneto, this side of the motor is kept clear of auxiliaries, but the two hand hole openings to the crank case, are provided with vertical breather pipes, the flared tops of which also serve as filler openings, when it is desired to replenish the supply of oil in the crank case.

The gear circulating pump is carried on the left side of the engine, which also is the

GLIDE "SCOUT" 45 HORSEPOWER SMALL TONNEAU

GLIDE SEMI-RACER TWO-PASSENGER RUNABOUT

is one which creates good impressions. It is one of the boasts of the Bartholomew Co. that "every part of a Glide car, excepting the tires only," is the product of its complete and well equipped plant in Peoria, Ill. Exception also must be made of the accessories, which are of standard make, and are unusually liberal both in quantity and quality, as is shown by the specifications of double ignition, with two sets of plugs and Eisemann magneto; lamps, horn, pump, jack and full tool kit; and the use

the rear. On the Scout and semi-racer, the clearance is 12 inches; the two touring models, however, are set a trifle lower, and have but 10 inches clearance. In addition to this, the use of the new drop frame serves to lower the bodies some 3 inches as compared with the practice employed on former models.

Originality in Glide construction begins with the motor, which, though of generally standard proportions, displays a number of special characteristics, most conspicuous of

valve side, and is mounted directly in front of the gear housing, and takes its drive directly from the cam shaft. As the valves are placed side by side, but one cam shaft is required. The cylinders are cast individually, and are provided with cleaning plugs near the heads, through which it is possible to scrape the interiors in order to free them of carbon deposits, without the necessity of dismantling the remainder of the engine. The lubricating system, which embodies a good sized reservoir in the bottom

GLIDE SPECIAL 45 HORSEPOWER TOURING CAR

GLIDE SPECIAL ROADSTER EQUIPPED WITH TOP

of 36 by 4½ inch tires on the touring model and 36 by 4 on the roadster and semi-racer, and 40 by 4 inch on the Scout.

Four different styles are produced, but as they are generally uniform as to mechanical structure, one description of the general design will apply to all. The points of difference relate mainly to body structure, wheel base and tire sizes. The four models are known, respectively as the "touring," "roadster," "Scout" and "semi-racer," and aside from matters of seating capacity and

which is the method of mounting and driving the engine auxiliaries, namely the magneto and timer, the circulating pump for the cooling system, and the engine lubricating system. Upon the right side of the motor, and in front of the half-time gears, rises a staunch housing, which encloses a vertical shaft. On the level with the cylinder bases is mounted the magneto, its drive being taken by bevel gears from the vertical distributing shaft, while the timer for the battery half of the ignition system is mount-

ed on the top of the pillar which thus is formed, and which, by reason of its construction, lends itself well to the purposes of lubrication. Save for the magneto, this side of the motor is kept clear of auxiliaries, but the two hand hole openings to the crank case, are provided with vertical breather pipes, the flared tops of which also serve as filler openings, when it is desired to replenish the supply of oil in the crank case.

Transmission is accomplished through the medium of a 13-disc clutch of large diameter, mounted in the fly wheel and running in oil. The rear axle and change gear system is an original Glide characteristic, and has been retained through several years of

successful practice. It embodies a heavy torsion tube, anchored to a cross frame member in front by means of a ball and socket joint, which also encloses the single universal joint of the propeller system. Just back of the joint, a special fitting provides means of attachment for the two diagonal braces which serve to maintain the parallelism of the rear axle with the front axle. The rear axle is of the floating type mounted on adjustable Timken bearings, with the three-speed selective change gear carried as an integral part of the torsion tube assemblage. By means of a massive housing, and careful design of bearings and shafts, it is rendered unusually staunch and durable. Careful design also is evidenced in the construction of the brakes, which are of the double expanding and contract-

### LUBRICANTS MIXED WITH FUEL

Some of the Grave Faults of the System,  
Due to Gravity Separation—What  
Tests Disclose.

Lubricating automobile motors by the simple expedient of mixing oil with the gasoline in stated proportions, is a method which has been more or less strongly advocated by several engineers, and which has worked out successfully in several instances in motors used for marine purposes. However, it has some drawbacks, which, indeed, are sufficiently important to lend point to the theory of one expert that the system cannot be made to succeed, owing to the

from those of greater specific gravity; if this will occur when substances differ only slightly, the result is bound to be even more marked when there is wide variation between specific densities.

Distilled water at 39 degrees F., which is the temperature of its greatest density, is a standard for all liquids and solids, being given a value of 1. As substances are heavier or lighter than water the specific gravity will be proportionate. A simple definition of specific gravity is the relation the weight of the liquid or solid bears to an equal volume of water. To determine this in a simple manner when liquids are to be tested, a so-called hydrometer is used. It is not possible to make a mechanical mixture of substances which have different specific gravities. Oil will float on water be-

RIGHT SIDE, SHOWING MAGNETO AND DRIVE

ing type. The drums are 16 inches in diameter and no less than 3 inches wide.

#### Inflating the Taximeter's Reading.

It frequently has been urged by irate taximeter cab patrons that the operators were unduly watchful of their employer's interests, and incidentally of their own commissions, in taking very wide turns on corners, making long detours to avoid blocked streets and getting entangled in traffic hold-ups. But the zeal of the ordinary cabby is totally eclipsed by the thoughtfulness of one loyal servant who was observed standing on the running board of his car on an uptown side street in New York City one evening this week, industriously manipulating the flag on his taximeter. Every time the flag went down, up went another initial charge for the waiting "fare" inside a neighboring house, and every time the flag went up the cabby looked over his shoulder apprehensively. When last seen he was still in a watchful attitude, gazing upon the dial of the meter almost affectionately, it seemed.

inevitable tendency of the two fluids to separate as a result of their different specific gravities. This objection, it should be borne in mind, in no way militates against the somewhat similar system which also has been proposed, in which the oil is fed to the cylinders through the medium of injections into the intake pipe. In regard to the method of mixture, the Co-operator brands it as a "dangerous undertaking" to apply the system to an automobile motor.

"It is not in the least difficult to test the matter," says the authority in question. "If gasoline and oil be mixed and allowed to stand for a time, the two ingredients, though derived from the same base, having different specific gravities, will separate, the heavier liquid falling to the bottom of the tank. It is a well known fact that if the commercial gasoline, as automobile fuel is improperly known (being composed of a wide range of hydro-carbons, of which the fraction known as gasoline is only a small part) is allowed to stand for a time, the more volatile constituents will separate

cause it is lighter. If one were to mix gasoline, kerosene and lubricating oil together and stir or shake briskly, as long as the mixture is agitated there would be an indiscriminate relation of liquids. Allow this to stand, however, and the three liquids will separate and exist in clearly defined strata in the container. Any doubter may try the experiment for himself.

"From the foregoing it will be evident that any attempt to mix gasoline and oil can have but one result: the separation of the two liquids as soon as opportunity presents itself for the heavier substance to settle. While the continued vibration which is set up when the motor car is in motion on the road would have the effect of agitating the liquids and prevent settling, it is at the same time clear that the fuel tank is not always empty at the end of every run, and for all these reasons the motorists will do well not to concern himself with a lubricating scheme which may be well enough for a motorboat engine and its steady work, but is altogether unsuited for the car."

## FIVE CAUSES OF GEAR FAILURES

Dr. Sargent Summarizes Them and Points Out the Several Factors that Make for Success.

Some of the general principles which have come to be regarded as essential to the successful performance of transmission gears were discussed by Dr. G. W. Sargent, at the recent annual meeting of the Society of Automobile Engineers, in New York City.

Failures in general may be traced to one or more causes, of which Dr. Sargent enumerates five, namely, improper design, selection of material not suited to the purpose, improperly manufactured material, improper treatment of material, and conditions arising in service. In the paper in question, the matter of improper design was the only one treated.

"Wilfred Lewis advises," said Dr. Sargent, "that in figuring the strength of a gear the teeth should be considered as a beam loaded at its extremity and supported at its base; and, furthermore, that one tooth carries the entire load distributed across its face. Right here I wish to emphasize this last. It is exceedingly important that the load be distributed across the face of the entire tooth and this is a condition which is very hard to obtain in some instances; for example, beveled pinions and gears. In these cases, even though the design of the pinion is correct, and the strength all that is necessary under correct alignment; the concentration of the entire load upon one portion of the face of the tooth of the gear, which would follow disalignment, would result in failure.

"We find in 'Elements of Machine Design,' under the heading of 'Influence of the Form of the Tooth on Its Strength,' Professor Unwin remarks: 'It will be seen presently that the teeth tend to break across at the root. The teeth are stronger the shorter they are, and the thicker they are at the root. They cannot be shortened without reducing the arc of contact, and their length should be such as to ensure a sufficient, but not excessive, arc of contact. The thickness at the root depends on the form selected for the teeth. Involute teeth are generally stronger than cycloidal teeth, the teeth are stronger the smaller the diameter of the describing circle used for the flanks. In no case should the flanks be described with a rolling circle, the diameter of which is greater than half the diameter of the pitch line, inside which it is rolled.'

"Under 'Conditions of Durability' he writes: 'The rolling of the teeth over each other, so as to spread the contact over a considerable length of tooth, is advantageous, but the sliding of the teeth against each other is injurious. The amount of

sliding action is the difference of the length of the face of one tooth and the acting part of the flank of its fellow. To ensure durability these two should be nearly equal. The wider the face of the wheel, the more area there is to resist the pressure.'

"I have already referred to Lewis's formula, in which the tooth is considered as a beam loaded at one end and supported at its base. . . . With a full sized tooth there is a strong tendency toward under cutting. Figs. 1 and 2 illustrate this point.

*An extra strong and well designed  
17 toothed pinion filleted at root circle.*  
Fig. 1

"In automobiles, all transmission gears are subjected to a heat treatment and most spur gears are made of the hardened and tempered types of steel. In these latter the under-cut produces an effect similar to a groove or notch; for in the hardened and tempered piece it produces a temper line at

*A weak and more or less undercut  
15 toothed pinion without fillets at the root circle.*  
Fig. 2

more severe under-cutting than a 15 or 17-toothed pinion; and in designing pinions and gears this fact should be borne in mind, especially since the work which the pinion has to do is frequently the most severe of any part of the transmission. Again where the width of the tooth of the bevel pinion and gear at the addendum-circle is greater the groove or notch and this temper line may develop into a plane of weakness. In pinions, this under-cut condition is more likely to occur, for here the number of teeth are fewer, consequently the difficulty of forming the tooth without an under-cut is increased. A 13-toothed pinion will show than at the root-circle, the effect of heat

treatment is to make the overhanging end or ends harder and more brittle than the rest of the tooth; so that any extraordinary severe stress or shock is bound to cause a break at the overhanging part. Disalignment of these gears and pinions can readily occur and usually the overhanging parts then receive the most punishment.

"Generally speaking, all gears which are to be heat-treated should be so designed as to lend themselves to the conditions accompanying or resulting from such treatment; for instance, the sections of the various parts of the gear should be, insofar as it is possible, of uniform dimensions, so that in heating, no one part will heat faster than another, thus warping the gear. Likewise in quenching uniformity of dimensions prevents unequal cooling and hence warpage or distortion.

"Steel expands .0000067 for each degree Fahrenheit that it is heated through and the force developed, if this expansion be opposed, is the same as that required to produce the same distortion by mechanical means. Then assuming a coefficient of elasticity of 30,000,000, 1 degree Fahrenheit would produce a strain equal to  $30,000,000 \times .0000067$ , or 201 pounds. Now the elastic limit of a piece of steel varies with its temperature, but assume it to be 40,000 pounds per square inch, which is exceedingly high for a hot piece of steel, a difference in temperature between any two parts of the same piece, of 200 degrees Fahrenheit, would permanently distort the piece, even if the cross section between the two parts was 1 square inch. In gears, it might readily be .1 square inch, which means a difference in temperature between any two parts amounting to 20 degrees Fahrenheit would produce a permanent deformation. When it is recalled that at 700 degrees centigrade a steel with 80,000 pounds tensile strength at the normal temperature, possesses but 1,000 pounds and an elastic limit likely less than one-half this amount; it will be seen that 3 degrees difference in temperature is sufficient to produce a permanent change in the piece, and a design, therefore, which permits one part of the piece to heat or cool more rapidly than another, is to be avoided as much as possible if distortion or warpage is to be reduced to a minimum. In the nature of things, this distortion of a heat-treated piece of steel cannot be eliminated, but since it can be brought to the least possible amount, and should be, since warped gears are noisy and likely to break. When one recalls that hardened steel has little or no ability to flow when strained beyond its elastic limit, the necessity for a correctly proportioned gear is more appreciated.

"Furthermore, sharp corners or edges and sharp re-entrant angles should be avoided in any heat-treated piece of steel, since such design is not only naturally a weak one, but also prone to have developed through the treatment, temper lines which readily become planes of weakness."

## MAKING MAGNETOS WATERPROOF

How the Effect is Accomplished by One Manufacturer—Design and Arrangement Which Aid Efficiency.

Automobilists frequently are cautioned as to the advisability of installing protecting housings for their magnetos for the reason that however well constructed the instrument in question may be when new, prolonged intimacy with dust, mud and water, ultimately may lead to a breakdown of the insulation. Owners who use the Volta magneto, however, have the assurance of the Buffalo Ignition Co., Buffalo, N. Y.,

ing to claim for it the waterproof feature mentioned, may be discovered by considering its individual elements. The condenser, for example, is enclosed in a separate water tight box which is so contrived that it may be removed merely by releasing a single screw; its retention being secured by means of a dowel pin in addition to the screw. Its location within the enclosure of the magnets and over the armature may be seen from the illustrations, where it is indicated at 68. The armature, which is numbered 100, in the accompanying illustrations, is completely enclosed, the cover plate which houses it is permanently sealed, and it is mounted on ball bearings, 30, which are of unusual size, and are separated by partitions from the remainder of the mechanism. The

contact segments in the housing proper, has a single T-shaped segment carried embedded in the hard rubber disc, 16, which receives current from the carbon brush, 25. A cross bar of this segment, as it rotates, makes contact successively with as many carbon distributing brushes as there are cylinders in the engine which is being served.

In this way, the distributor may be said to be an inversion of the ordinary type, the stationary brushes replacing the ordinary segments, and the rotating segment replacing the ordinary rotating brushes. The effect is greatly to reduce the likelihood of cross arcing between the collector points, since the stationary brush construction greatly increases the insulating distance

THE VOLTA MAGNETO AND END AND SIDE VIEWS, SHOWING ARRANGEMENT OF PARTS

which produces that device, that no such precaution is necessary. Indeed, it is claimed that playing the hose on the Volta will in no wise reduce its capacity to generate the sparking current which makes its appearance in large arc-flame flashes at the plugs. Another point of excellence, which is emphasized in the same connection is that its construction is such that it is not liable to suffer from the effects of over oiling.

Of generally standard form, embodying high-tension armature winding, which generates the high tension current directly on the armature, and without the use of an external coil, its design involves several unusual and meritorious features which make directly for prolonged and effective service. Among such features may be mentioned the ready removability of the condenser and the complete isolation mechanically of the various individual elements of the device. A simple dual ignition system using a single set of spark plugs and the main distributor of the magneto is another attribute of the system.

How the entire instrument is so thoroughly protected that its makers are will-

bearings are lubricated from the oil caps, 15 and 32, and the wells which they feed are provided with drain outlets to prevent flooding.

As the armature diameter is somewhat greater than ordinary, and is provided with about 600 more turns of the windings, a hot spark is generated at ordinary cranking speeds. The air gap between the armature and the pole pieces is reduced to its smallest practical limits, in furtherance of which ideal, the exterior of the armature is ground to size after the member is completely assembled and is ready for use. Care in winding and insulating the armature is carried to such a point that during the winding process a special form of indicator shows the condition of the insulation at all times. If the wire breaks or a short circuit occurs the fault is detected at once.

Further protection for the vital parts is provided in the distributor casing, 18, which is placed directly over the high tension collector ring, 65-67, and which encloses the high tension carbon collector brushes, 24-25, to the distributor. The latter, instead of having a number of high tension

between the respective points. The method of mounting the distributor in ball bearings, 11, 12, 13, may be seen from the illustration.

As in the case of the distributor, the contact breaker may be said to be of inverted construction, in that the cam itself rotates, while the "breaker box" so-called, is stationary. The cam, 60, is of hardened steel and runs against a steel roller, 38. The contact screw, 84, is stationary, and hence may be adjusted while the engine is running. The primary current, from the windings runs through an insulated central wire leading through the armature shaft to the insulated button, 43, through the flat spring, 42, to the insulated mounting, 36. From the contact arm, it passes to the grounded contact point, 41. One of the binding posts, 45, is connected to the condenser at point 91, while the other connects with the ground switch.

Grand Rapids, Mich., has decided to give an automobile show and is completing arrangements to that end. The week of February 17 has been selected by the promoters.

**TERRY'S PLEA FOR UNIFORM LAWS**

**A. A. A. Chairman Shows How Motorists are Used as Shuttlecocks—Clear Exposition of a Vexed Subject.**

In his plea for uniformity in automobile legislation delivered before the convention of the National Civic Federation, Charles Thaddeus Terry sketched the existing situation and the need for it more clearly probably than it ever was described before. As chairman of the legislative board of the American Automobile Association, Mr. Terry has devoted, perhaps, more study to the question of uniform automobile legislation than any other investigator in the country.

Mr. Terry's speech virtually outlined the fundamental objects of the coming National Legislative Convention to be held under the auspices of the American Automobile Association in Washington just one month later, on February 15, 16, and 17. He said:

"There are 33 states which have separate, distinct, and in many respects very different motor vehicle regulations. When you consider this and the further fact that even within the borders of a single state in not a few instances the separate counties, towns, villages and cities have passed motor vehicle ordinances peculiar to such localities and differing one from another and all differing in some respects from the motor vehicle law applicable to the state in general, you get as a net result confusion worst confounded.

"There are two ways in which this particular evil may be cured—one is by the enactment of Congress of a Federal Registration Automobile Bill, providing only, in substance, that upon registration at a bureau of the National Capitol after registration has been had in the state of the residence of the owner of the motor vehicle, his license to operate and use the vehicle shall be recognized by every state in the Union, and thus freedom in the use of the vehicle secured, without further license and without payment of further fees, the other, by the enactment of all the states of a uniform motor vehicle law exempting non-residents from its registration provisions, as does, for example, the law of the state of New York.

"No one will dissent from the proposition that uniformity in motor vehicle regulation is not only expedient, but in the highest degree desirable. It is conceded that more harm and injustice are sometimes brought about by lack of uniformity of the laws of the various states than by imperfect or even bad laws in special instances. Nowhere is this better illustrated than in the case of travel upon the highways.

"To take a concrete example, suppose that one were to start in his motor vehicle

at New York to make a trip to his National Capitol at Washington, to transact business with his Government. He will have no sooner left the ferryboat on the Jersey shore before he will be stopped and notified that he can proceed no further. He will find that what he had always assumed to be his natural right to use the highways of the country so long as he scrupulously regarded the rights of others up the highway, has been created into a privilege to be purchased only by the payment of money and the expenditure of time and trouble in seeking out one of the government officers and paying fees for a so-called 'license.' He must find the proper officer at the place where these fees are received, fill out and sign an application blank, pay his money and receive four tags, each one of which is good for two days' enjoyment of this grand privilege of using the highways; and after he has done all these things he will find that the state is not yet satisfied. He must, before he may proceed, fill out and execute a regular power of attorney, making the Secretary of State his agent, to receive process in any proceeding which may be brought against him while he is enjoying this so-called inestimable privilege.

"When he reaches the borders of the state of Maryland he will be again held up and obliged, before he will be allowed to continue his journey, to go through very much the same process as he did when he attempted to cross the borders of New Jersey. He will be put to pretty much the same annoyance, inconvenience and expense when he attempts to cross the line into the District of Columbia.

"There seems to be no reason why regulations applicable in one section of the country should not be equally applicable to every other section of the country, why the provisions of law adequate for one state should not be equally adequate for every other state. It would seem that in this country of ours, if we are really a nation, there is no reason why a license to operate a motor vehicle good in New York should not be equally good in San Francisco and in every portion of the highway between these two cities, and why one knowing thoroughly the law under which he has secured such license should not be able to proceed from New York to San Francisco in the perfect confidence that if he obeys that law he will not be violating the law in any of the jurisdictions traversed by the highway upon which he travels.

"The automobilist claims no special privileges, but he claims the right to fair treatment, and to that end, that the laws which regulate the use of his highways shall be so plain and reasonable that he who runs an automobile may read them, and may obey them, and still may travel with comfort and freedom from intolerable exactions and needless burdens."

A Federal registration measure now is before Congress in the Cocks bill. Its provisions are indicated in Mr. Terry's speech,

**MUFFLER EXPLOSION OR PISTOL?**

**Question Brought up in Novel Manner in a Murder Trial—Automobile Experts Give Testimony.**

How many persons who have heard both can distinguish the backfire or explosion in an automobile or motorcycle muffler from a pistol shot?

This simple question, more easily asked than readily answered, and seldom if ever thought of, was brought up last week in a murder trial in Milwaukee, Wis., and played a novel and conspicuous part in the defense.

Briefly the facts are as follows: Ward E. Hedger is on trial on a charge of murdering his wife, Louise, the evidence thus far given being purely circumstantial. Mrs. Hedger was shot in the back of the head and instantly killed one morning while in her kitchen. There was no clue to the murderer, the husband being arrested merely through a chain of circumstantial evidence. No one saw the crime committed but several witnesses for the state testified that they heard pistol shots in the neighborhood about the time the murder was supposed to have been committed.

It was to refute or confound this testimony, and to create a reasonable doubt that the clever lawyer for the defense dragged several automobile and motorcycle experts into the case. He sought to show that the so-called pistol shots which were heard might have been nothing more serious than the muffler explosions of a passing automobile or motorcycle.

The testimony of the experts agreed that pistol shots could not be distinguished from the explosions of a muffler. One of them said that he had conducted experiments in which pistols were fired, followed by the explosions in the mufflers of motorcycles, and that it is impossible to distinguish the sounds. The experiments were made with the explosions out of doors, while the witnesses listened from both outside and inside. One of the jurymen raised the point as to whether the expert had experimented with the pistol and motorcycle when he was indoors and the explosions indoors also. He replied that this had not been done and therefore some of the force of the testimony was lost.

The case, however, is exceedingly interesting, not alone from the fact that it is the first time the point ever has been raised, but because it presents unlimited possibilities in future cases where there is a chance for reasonable doubt upon such issues.

In connection with the winter fetes to be held by the Touring Club of France next month, a competition for automobile sleighs will be inaugurated. The tests will be made on February 13th.

## RECENT PATENTS.

937,808. Vehicle Wheel. Ernest Hopkinson, East Orange, N. J. Filed March 8, 1905. Serial No. 249,014.

The combination with a wheel rim having an inclined flange seat and a contractible and expansible side flange engaging said flange seat, of a hoop or band encircling said rim and presenting oppositely inclined tire seating surfaces.

938,196. Running Gear. Charles O. Wyman, Anoka, Minn. Filed Jan. 22, 1906. Serial No. 297,095.

1. The combination with the forward and rear axles and carrying wheels therefor, of a frame mounted on said axles, a driving shaft geared to said axles, a crank shaft arranged transversely on said frame at right angles substantially to said driving shaft, a source of power connected with said crank shaft, and a chain composed of skeleton links connecting said crank shaft and said driving shaft, substantially as described.

938,253. Combined Turbine Muffler and Fly Wheel. John A. Lawson, New York, N. Y. Filed Dec. 22, 1908. Serial No. 468,829.

The combination with a fly wheel having a plurality of pockets in the periphery thereof, of two concentric rings encircling said wheel and spaced apart to leave an annular chamber therebetween, the outer ring having a series of transverse ridges in its outer surface, pairs of plates at each end of the wheel and spaced apart to form two annular chambers, the inner plate of each pair being provided with apertures therethrough whereby said last mentioned chambers may communicate with the first mentioned annular chamber, each of said plates having a series of outwardly extending lugs or flanges in the plane thereof and in alignment with said transverse ridges, a peripheral row of bolts extending through said ridges and said lugs or flanges to hold said rings and plates together rigid in respect to each other, inlet and outlet conduits terminating adjacent the periphery of the wheel, and an inlet conduit and an outlet conduit for the chambers between said plates and the chamber between said rings.

938,254. Starting Crank for Internal Combustion Engines. John A. Dawson, New York, N. Y. Filed Feb. 26, 1909. Serial No. 480,137.

1. A starting crank for internal combustion engines, comprising two members having opposed gripping surfaces for receiving therebetween the engine shaft, two crank

arm members having relative longitudinal movement and connected to the first mentioned members respectively, a handle member pivotally connected to one of said crank arm members and movable to a position at right angles thereto or to a position substantially parallel thereto, and a second handle member pivotally connected to the first mentioned handle member and having operative engagement with the other crank arm member when said handle members are at substantially right angles to the crank arm members.

938,360. Valve Gear. Austin M. Wolf, New York, N. Y. Filed Jan. 9, 1909. Serial No. 471,474.

1. The combination with an internal combustion engine having inlet and exhaust valves, of an actuating rod having arms projecting therefrom and adapted to engage the stems of both the said valves, a cam imparting the necessary motion to said actuating rod in order to effect an opening of each valve at the proper time, and means whereby said arms can be simultaneously swung out of position, as described.

938,386. Valve Gear for Explosive Engines. Arthur A. Karcher, Detroit, Mich. Filed March 5, 1909. Serial No. 481,494.

1. The combination with a plurality of parallel cylinders having normally closed inlet and exhaust valves located beside each other in the head of each cylinder, a set of telescoped rock shafts of different lengths extending transversely across the cylinder heads and each having arms projecting oppositely and bearing on the stems of the respective valves of each cylinder, to open the same when the shaft is rocked, a spring operatively connected to each shaft to rock the same in one direction, and a cam operatively connected to each shaft and acting in opposition to the spring to rock the shaft in the other direction.

938,456. Automobile Headlight Bracket and Mechanism for Turning Same. Frank H. Aubeuf, Oneida, N. Y. Filed March 5, 1909. Serial No. 481,231.

1. In an automobile, the combination with the running gear frame and steering apparatus, of pivotally supported head light brackets, mechanism for turning said brackets comprising a rock shaft supported on the frame and operated by the steering apparatus, arms fastened to the brackets, and rods transmitting motion from said shaft to the brackets as set forth.

938,679. Variable Speed Apparatus. Eugene C. Marble, Chicago, Ill. Filed Dec. 12, 1908. Serial No. 467,276.

1. In a variable speed apparatus, an internal brake comprising a pinion having a friction member and rotatable upon its own axis, and a non-rotatable member movable radially into frictional adherence with the pinion to retard and prevent rotation of the pinion on its own axis.

938,753. Means for Preventing Rebound in Vehicles. Samuel Furmidge, St. Louis, Mo., assignor to Supplementary Spiral Spring Company, St. Louis, Mo., a Corporation of Missouri. Filed Dec. 22, 1905. Serial No. 292,980.

1. In a device of the character described, the combination of a fixed friction plate, a movable friction plate, each being concave on the side adjacent its fellow, and a convex washer interposed between same.

938,782. Running Gear for Vehicles. Isaac E. Palmer, Middletown, Conn. Filed Feb. 17, 1908. Serial No. 416,170.

1. Running gear for trackless power driven vehicles comprising a truck movable with respect to the body frame and connected to the rear thereof, three wheels mounted upon said truck, two of said wheels being at opposite sides of said vehicle one of said wheels being arranged between the sides of the vehicle so as not to track with the said other wheels of said truck, and means to drive a plurality of wheels of said truck including said non-tracking wheel.

938,783. Trackless Power Driven Vehicle. Isaac E. Palmer, Middletown, Conn. Filed May 6, 1908. Serial No. 431,156.

1. An automobile comprising in combination a body frame composed of opposite, unitary side members of substantially the length of the automobile and transverse connections therefor, a fixed front axle mounted in said frame, a pair of non-driven, but dirigible wheels mounted upon said axle, two axles to the rear of said front axle one of said two rear axles being mounted in both side members of said frame, a pair of driven wheels mounted upon said axle and a pair of non-driven wheels mounted upon the other of said two mounted in said body frame for movement in a substantially horizontal plane, a motor supported by the frame, connections therefrom to the first mentioned of said two rear axles, steering means connecting said front wheels and connections between said steering means and said movable rear axle whereby when steering movement is imparted to the dirigible wheels of the front fixed axle steering movement is imparted to said rear movable axle.

938,786. Trackless Power Driven Vehicle.

Isaac E. Palmer, Middletown, Conn. Filed Nov. 13, 1908. Serial No. 462,361.

1. Running gear for trackless power driven vehicles comprising, in combination, a vehicle body, an axle or support, a pair of independent yokes or frames, mounted for independent rocking movement at opposite sides of the vehicle upon the axle or support in conformity to the road bed, a yielding connection between each yoke or frame and the vehicle body, and means mounted concentrically with one or both of said yokes or frames for driving one or more of the wheels upon each yoke or frame.

938,828. Touring Map Carrier for Automobiles. Harry Dalitz, Cleveland, Ohio. Filed Nov. 17, 1908. Serial No. 463,120.

1. A tourist's map carrier for automobiles and like vehicles, comprising a body having trough shaped ends transversely with slots centrally therein open to the top of said body, and spools with spindles in said slots, in combination with a cover over said body provided with projections at its sides extending down over the upper portions of said slots and slotted at their extremities to engage over the ends of said spindles, said cover having downward projections centrally at its sides having horizontal open slots on a plane beneath said body and a locking device on the said body adapted to engage in said slots.

438,933. Carriage Top. William Woop, Ossining, N. Y. Filed Jan. 30, 1909. Serial No. 475,165.

1. A carriage top, having a vertical main stay pivotally supported upon the vehicle, a forwardly projecting stay, a rearwardly-projecting stay, the said stays being removably secured to the said main stay, the end of the forwardly projecting stay being secured to the upper portion of the main stay and the rearwardly projecting stay being secured to the main stay at a lower point, the said main stay extending below its own pivotal point, and devices whereby the detached ends of said forwardly projecting and rearwardly projecting stays may be secured together to the end of the main stay below its pivotal point.

939,055. Roller Bearing. Onesime E. Michaud, St. Louis, Mo. Filed June 13, 1908. Serial No. 438,270.

1. A roller bearing comprising a bearing ring having an annular groove therein, annular shouldered portions at each side of said groove, and annular recessed portions next to said shouldered portions at the outer sides thereof, a series of rollers arranged to travel in the annular groove in said bearing ring, said rollers having axial end spindles, separable rigid spacing rings for said rollers, said spacing rings being adapted to loosely fit said annular shouldered portions and having a series of perforations arranged to receive the end spindles of said rollers, and annular retaining devices for said spacing rings detachably secured in said annular recessed portions of said bearing ring.

939,056. Roller Bearing. Onesime E. Michaud, St. Louis, Mo. Filed Oct. 5, 1908. Serial No. 456,171.

1. The combination with an axle, of a wheel hub rotatably mounted thereon, said hub having bearing rings in each end, and each of said bearing rings having an internal annular beveled end thrust shoulder near its inner end, an inner bearing ring sleeved on said axle and in co-operative relation to the bearing ring in the inner end of said hub and having a beveled end thrust shoulder diagonally opposite to the shoulder on said hub bearing ring, a stop on said axle adapted to bear against the outer end of said axle bearing ring, a bearing ring adjustably mounted on said axle endwise thereof in co-operative relation to the bearing ring in the outer end of said hub and having a beveled end thrust shoulder diagonally opposite to the shoulder on said last mentioned hub bearing ring, and a series of cylindrical rollers interposed between the bearing rings at each end of said hub in rolling contact therewith, said rollers having beveled end portions corresponding to the bevel of said end thrust shoulders.

939,077. Trackless Power Driven Vehicle. Isaac E. Palmer, Middletown, Conn. Filed Nov. 13, 1908. Serial No. 462,362.

1. Running gear for trackless, power driven vehicles comprising in combination a body frame, a driving shaft journaled in said frame, four vehicle wheels mounted upon the rear part of said body frame, connections from the driving shaft for driving all of said four rear wheels, said four wheels being arranged in pairs and one of said pairs of wheels being dirigible, and means simultaneously and automatically to disconnect said pair of dirigible wheels from driving relation to said driving shaft upon lateral deflection thereof by the steering mechanism while leaving the other pair of rear wheels in driving relation to said driving shaft, so that said dirigible wheels may travel when disconnected at a differential speed with respect to said other pair of rear wheels and the vehicle be driven by said other pair of rear wheels.

939,180. Steering Gear for Vehicles. John A. Wilson, Jr., Buffalo, N. Y., assignor to Noye Manufacturing Company, Buffalo, N. Y., a Corporation of New York. Filed May 10, 1909. Serial No. 495,101.

1. A steering gear for vehicles comprising a mast, a worm divided lengthwise into a plurality of sections which are mounted on the mast and are adjustable lengthwise relatively to each other, and a screw nut engaging its internal threads with the external threads of said worm sections.

939,357. Magneto Electric Machine for Ignition Purposes. Charles A. Vandervell and Frederick I. Hoffman, London, England. Filed Sept. 25, 1908. Serial No. 454,809.

1. In a magneto-electric machine having a movable element a current distributor consisting of a device having a series of

paths joined up as one continuous path, a series of contact pieces disposed in said paths, a shuttle adapted to co-act with the said paths and constituting a contact piece which co-acts with the contact pieces of the said paths, the shuttle being carried directly by the movable element of the magneto-electric machine and means for permitting the shuttle to follow the continuous path, substantially as described.

939,481. Carburetter. Edgar A. Dickson, Denver, Colo., assignor of one-half to Edwin W. Hurlbut, Denver, Colo. Filed Dec. 21, 1907. Serial No. 407,491.

1. A carburetter comprising in combination with a circular housing having a central inlet and a peripheral outlet, an injector entering said housing through said inlet, and a rotary mixing member having opposed concentric baffles formed therein adapted to receive fluid elements opposite said inlet and to discharge said elements in a mixed condition through said outlets, said mixing member comprising means for passing the fluid from side to side thereof and means to finally discharge them peripherally.

939,589. Variable Speed Transmission Gear. Edward P. Cowles, Lansing, Mich. Filed Sept. 5, 1903. Serial No. 172,106.

1. In a variable speed gear mechanism, the combination of two elements geared together and each comprising a plurality of gears of different diameters, constantly connected to a common rotatable member, the gears of one element being arranged in reverse order to those of the other and each gear adapted to act with a particular gear in the other element, and means for transferring the connection between said elements from one of said co-acting pairs to another without interrupting such connection.

939,643. Changeable Speed Transmission Mechanism. Arthur L. Slee, Berkeley, Cal. Filed April 20, 1908. Serial No. 428,011.

1. In a changeable speed transmission mechanism, the combination of a driving and a driven shaft in alignment, variable speed gears independently rotatable about the axis of the driven shaft, a gear fast on the driven shaft, gear connections between the variable speed gears and said driven shaft gear, means for connecting the driving shaft with any of said variable speed gears, and means for reversing the direction of movement of one of the variable speed gears to reverse the movement of the driven shaft.

## DEALERS HOLD ANOTHER SESSION

Take Further Steps Toward the Organization of a Licensed Association—Board of Directors Nominated.

In the welding together of the New York dealers handling cars licensed under the Selden patent, into an association, the process is not progressing with the smoothness which might be looked for, and not all of those who have attended the two meetings which so far have been held appear to be wholly in accord with the program laid down by the "steering committee." While no real antagonism to the organization idea appears to exist, a number of the licensed dealers are exhibiting decided opinions of their own in regard to some of the details, so that on these questions there have been some divisions.

The second meeting toward organization was held at the Automobile Club of America yesterday afternoon (Wednesday), with 38 dealers present, representing 40 makes of cars licensed under the patent. Percy Owen, temporary chairman, presided, and Sidney B. Bowman acted as temporary secretary. As chairman of the committee on organization, Owen read that committee's report, which was accepted. The committee is drawing up constitution and by-laws which will aim to meet the wishes of the prospective members, and is being assisted by the law firm of Lennon, Bailey & Brixey.

During the voting, there occurred a decided division on a point involving the association's policy, and a discerning observer remarked the fact that with a vote of 18 to 15 the majority side numbered 17 branch managers, while the minority was represented almost entirely by dealers. From this it was deduced that the branch managers and the dealers operating for themselves have reason to see things from different viewpoints.

A board of directors was nominated as follows: George W. Bennett, White Co.; Sidney B. Bowman, Marmon and Apperson; M. J. Budlong, Packard Motor Car Co.; Gen. J. T. Cutting, Oldsmobile Co.; Harry Fosdick, Hol-Tan Co.; Robert D. Garden, Pierce-Arrow; Carl H. Page, Chalmers; J. F. Plummer, Locomobile Co. of America; James Joyce, American Locomotive Co., and Charles E. Skinner, Mitchell. The meeting adjourned for about a week, when officers are to be elected and the final organization completed.

### Lamp Makers Adopt Co-operative Plan.

In the line with the spirit of combination and co-operation in selling, which is being manifested in various branches of the trade, a coalition of lamp makers to promote their respective sales has been effected between the Rushmore Dynamo Works, of Plainfield, N. J., and the R. E. Dietz Co., of New York City. The coalition relates purely to the selling end, and provides that the sales department of each concern shall handle the other's goods in addition to its own, so that with Rushmore gas lamps and Dietz oil and electric lamps, a complete line will be presented. No change of name or business for either concern is involved.

### Oklahoma's Factory Changes Location.

The Dixie Motor Car Co., which several months since was organized in Frederick, Okla., has increased its capitalization from \$100,000 to \$250,000 and removed to Oklahoma City. The company expects to produce 500 cars during the current year, the line comprising four models listing at \$1,050 to \$2,500.

### Chalmers Drops Its Hyphenation.

The Chalmers-Detroit Motor Co., of Detroit, Mich., making the Chalmers-Detroit cars, has changed its name. Hereafter it is to be known as the Chalmers Motor Co., and its product as the Chalmers. The new name avoids confusion with many of the more recent concerns who have adopted the "Detroit" hyphenation.

## MAXWELL-BRISCOE NOW A MERGER

With the Columbia It Becomes the Nucleus for a \$16,000,000 Combine—Briscoe Tells of His Plans.

Having avoided one merger proposition which was open to it, the Maxwell-Briscoe Motor Co., with plants at Tarrytown, New-castle and Pawtucket, has carried out the plans which have been whispered in connection with it since last July and has formed a consolidation or combine of its own, with a capital of \$16,000,000, to take in not only the Maxwell-Briscoe company, but other makers of cars, together with parts plants and accessory concerns. Among the first of the outside companies to be acquired by the new creation, which is called the United States Motor Co., is the Columbia Motor Car Co., of Hartford, Conn., formerly the Electric Vehicle Co.

The United States Motor Co. was incorporated some time since under New Jersey laws, with \$2,000 capital, but last week the capital was increased to \$16,000,000, half common and half preferred, following which a preliminary announcement was made indicating something of the plans and purposes of the big corporation. J. D. Maxwell, Benjamin Briscoe and others who have directed the affairs of the Maxwell-Briscoe company will be "prominent" in the manufacturing, the policy and the financial management of the new corporation, according to the announcement, although the representatives of "other companies soon to be acquired" will be associated with it. President Briscoe, of the Maxwell-Briscoe company, however, makes it plain that neither Mr. Maxwell nor himself have relinquished in any way their responsibilities in connection with the latter.

Although the purchase of the Columbia Motor Car Co. by the new company was something of a surprise, other likely acquisitions are not lacking since the

Maxwell-Briscoe interests are known to have a finger in several other companies either by money or consanguinity; among them are the Brush Runabout Co., and the Briscoe Mfg. Co., of Detroit, Mich., the Westchester Appliance Co., and the Ajax-Grieb Rubber Co., of Trenton, N. J., although on behalf of the Ajax company it is denied that it is related in any way to the United States Motor Co.'s plans.

In connection with the purchase of the Columbia company, it is pointed out that in addition to the Selden patent the company owns 128 other patents affecting the structural features of automobiles. So far as the Selden patent is concerned, however, the Columbia company has no control over it, in consequence of the contract with the Association of Licensed Automobile Manufacturers by which the latter has the Selden matter wholly within its own hands, the arrangement being that the Columbia company, as owner of the patent, is paid royalties not exceeding \$150,000 per year and not less than \$90,000. The Columbia people all along have made their own division with George B. Selden, the inventor under the patent, and the deal with the United States Motor Co. provides that the Columbia's net profits on the Selden royalties will go to the old Columbia stockholders.

The Columbia Motor Car Co. will not lose its corporate existence but will continue to do business as a Connecticut corporation. Each of the individual companies in the combination will maintain its stock outstanding, but this stock will be turned in by its present owners and exchanged for stock of the United States Motor Co. The old stock is to be deposited this month. Of the \$1,000,000 common and \$2,000,000 preferred stock of the Columbia corporation, there is outstanding \$2,400,000. Extensive plans are projected for the Hartford factory, which is to make the high priced cars of the United States Motor Co.'s line. C. W. Kelsey, who has been a Maxwell-Briscoe sales manager, already has been transferred to the Columbia plant.

"It appeared on investigation," says Mr. Briscoe, in speaking of the matter, "that the Columbia company had a corner, so to speak, on practically all important automobile patents. I considered these patents such a menace to the security of our business that I opened negotiations with the Columbia owners resulting in the purchase of the concern. Within a short time we shall have from 2,000 to 2,500 men employed at the Hartford plant.

"Without aggregating to itself the function of censor to the industry," he continued, "the United States Motor Co. will throw the weight of its influence for such improvements as will become of benefit to the public and also to the interests of other legitimate manufacturers. The rapid growth of the motor car industry has naturally been attended with many defects in methods, and there is no doubt that manufacturing and distributing methods call for reform. The

swarm of new promotions based on ignorant hope, and doomed for the greater part to disaster, will make matters still more complicated in the future. The troublesome patent situation, which bids fair to involve great burdens on the industry, unless something be done to prevent it, is a field in which the company will be able to work to the benefit of all properly concerned.

"It is the express intention to make public the true financial condition and other general information regarding the conduct of the company's business and the scope of its undertakings. The company will be in a position to control many sources of production for such material as is styled by the automobile manufacturers as raw material, and can thus ensure a greater and more regular production than otherwise would be possible. It will have a large cash working capital, and with a big product and a wide line of cars will be represented in every village and hamlet of the United States.

"I am a co-operationist, and I believe that through the medium of this new company my associates and myself can work out plans which we long have had in mind and which we believe will exemplify most successfully a practical co-operation throughout all departments of the company's business."

Among other plans which from unofficial sources it is intimated are under way, is the building of an immense parts factory in Detroit, on the big property purchased not long ago by the Brush Runabout and Briscoe Mfg. Co. interests.

#### Hudson to Build a Big Plant.

Since being weaned from the Chalmers-Detroit Motor Co., the Hudson Motor Car Co., of Detroit, Mich., has proceeded to testify to its independent and more mature estate by developing plans for a new \$400,000 factory, to be built in the district known as old Fairview, contiguous to Detroit. The plans to build the new factory were completed, following the purchase of 68 acres of the D. J. Campau farm, between Kercheval and Jefferson avenues, by the controlling interests of the Hudson company and members of the Chalmers-Detroit company.

The deal also involved 18 acres of an adjoining farm, and all this added to adjacent property already owned by the purchasers, makes a total of 106 acres for the factory site, the price paid being said to be approximately \$140,000. In addition to providing a site for the Hudson company, the purchase is expected to stimulate considerable real estate activity in Fairview, due to the fact that a factory probably is to be built on it for the Gray Motor Co., and the Michigan Central railway is to build a freight and passenger station in the vicinity.

"The property is largely acquired by Messrs. Hudson, Coffin, Bezner, Jackson and myself," explains President Roy D.

Chapin, "we being the controlling interest in the Hudson company. Associated with us is Hugh Chalmers, of the Chalmers-Detroit Motor Co., who is interested in a portion of the property and also in the Gray estate, which has done much to develop Detroit's new districts. This association also means the probability of the construction on this property of a large factory for the Gray Motor Co. in the near future."

#### Fiat Turns to Bicycle Manufacture.

According to foreign prints, the F. I. A. T. Co., Italy's largest and most famous automobile manufacturer, has taken up the production of pedal propelled bicycles, and will place them on the market during the current year. The De Dion-Bouton Co., which probably occupies a similar position in France, made a similar move last year. It is rather a remarkable fact that while practically all of the many American bicycle makers, who went into the manufacture of automobiles, discontinued the production of bicycles, comparatively few of their competitors across the water, who similarly took up motor cars, let go of their bicycle business.

#### Selden Licenses for Five More.

Another group of licensees, under the Selden patent, has been announced by the Association of Licensed Automobile Manufacturers, the new names appearing on the licensed list, in addition to those already given, being the Cartercar Co., Pontiac, Mich.; Ewing Automobile Co., Geneva, Ohio; Fuller Buggy Co., Jackson, Mich.; Rapid Motor Vehicle Co., Pontiac, Mich., and Brewster & Co., of New York, importing the Delaunay-Belleville. The complete list of licensees up to January 29 contains the names of 62 American manufacturers and two importers.

#### Baumheckel Makes a Change.

Charles Baumheckel, formerly of the Standard Varnish Co., Cleveland, has resigned his connection with that concern and become identified with the Forbes Varnish Co., of the same city, of which he has been elected vice-president. Baumheckel's duties will keep him circulating in the automobile trade as of yore.

#### Gilbert Opens a New York Branch.

The Gilbert Mfg. Co., of New Haven, Conn., has opened a branch in New York City, at 2002 Broadway, corner of Sixty-eighth street. The branch is to maintain a complete stock of Gilbert motor car accessories and Bowers carburettors for the convenience of the New York trade.

#### Croninger Joins American Locomotive.

R. Harry Croninger has resigned from the Pennsylvania Auto-Motor Co., of Bryn Mawr, Pa., to assume the management of the American Locomotive Co.'s plant at Providence, building the Alco cars. The change took place on the 1st of February.

**YEAR'S EXPORTS NEARLY \$8,000,000**

**Gain During Twelve-Month Almost Reaches \$3,000,000—Canada, Great Britain and France the Biggest Buyers.**

Exports of American motor cars are still climbing higher and higher. During the month of December there were shipped abroad three times as many cars as during the corresponding month of 1908, the quantities being 458 and 159 respectively. The average value of the exported cars fell, however, from \$1,445 to \$1,099 per car. The aggregate value of the 458 cars was \$503,431; that of the parts, \$96,604; the total value of both being \$600,035, compared with \$264,171 in the same period of 1908. The gain in car values amounts to more than 219 per cent.; that in the value of parts to over 281 per cent.

For the twelve months of 1909, ending December 31, the aggregate gain over 1908 amounted to \$2,838,023. During this interval 3,686 cars were exported, as against 2,164 in 1908; the gain in car values amounting to \$2,542,738, while parts values improved to the tune of \$295,285. As was clearly foreshadowed in the monthly reports, Italy shows the chief falling off in imports of motor cars from America, the British East Indies being the only other country in which no increase can be shown. The greatest actual gain is presented by British North America, where the value of cars imported from this country increased from \$1,115,540 in 1908, to \$2,437,042 in 1909, a clear gain of over 110 per cent. The greatest proportionate gain, however, is shown by Africa, to which country were shipped during 1909 fully \$69,181 worth, compared to \$14,993 in 1908, a gain of nearly 500 per cent.

Twelve of the fourteen countries stand on the plus side, with British North America leading, and the United Kingdom, France, Mexico and the West Indies following in the order named. Italy and the British East Indies are on the minus side, with an aggregate loss of \$41,279. The report in detail:

**Body Builders, Too, Cross the River.**

As a means of providing for the growing Canadian trade, the Victor Mfg. Co., of Detroit, Mich., and the Walkerville Carriage Goods Co., of Walkerville, Ont., which latter is just across the river from Detroit, have come to an arrangement by which the factory property formerly occupied by the Imperial Rattan Co., in Walkerville, will be used for the manufacture of automobile bodies and the building of tops. The woodwork and painting will be in the hands of the Victor company, while the trimmings and tops will be taken care of by the Carriage Goods Co., whose main plant is across the street. The establishment of Canadian branch factories by Detroit makers of cars is looked to for the main volume of anticipated business.

**Marion Men to Make a \$650 Car.**

Some confusion is likely to arise, at least in a limited circle, if a new motor car manufacturing company, which has started in Marion, Ind., carries out its expressed intention of calling its product the Marion Flyer, as already there is a car of this name on the market, made by the Willys-Overland Co., of Toledo and Indianapolis. The new concern, which is known as the Marion Automobile Mfg. Co., has taken a location at Western avenue and West Second street for a factory, and announces that its machines are to sell for \$650. It is controlled by three Marion young men, Clifford Rust, Charles Rennaker and John Rennaker.

**Allen Near to Fort Wayne Money.**

Having agreed to raise \$50,000 to induce a new concern called the Allen Motor Car Co., to locate in Fort Wayne, Ind., the citizens of that place already have secured \$35,000, and are taking active measures to obtain the remaining \$15,000 of the amount. A committee is working to that end.

**Old Company to Make Automobile Wheels.**

The Sarven Wheel Co., Indianapolis, Ind., the formation of which dates back to 1850, has installed the necessary machinery and commenced the production of automobile wheels. Heretofore the company has manufactured carriage and wagon wheels only.

**NEW JERSEY LOPS OFF "DEADWOOD"**

**Long List of Corporations Whose Charters are Annuled—Few Ever Got Beyond the Hopeful "Paper Stage."**

As usual, New Jersey's annual weeding out of corporations that have for the last two years failed, refused or neglected to pay the State taxes assessed against them for the year 1907, resulted in the rescinding of several hundred charters. Most of the delinquents never got beyond the "paper stage," the laws of New Jersey being of the sort that encourage the incorporation of mere schemes as well as hemillioned trusts. Among the charters that have been declared null and void are as follows:

Aitken Light Car Co., Allegheny Motor Vehicle Co., Atlantic Automobile and Machine Works, Auto Cushioned Hub Co., Automobile Press, Automobile Speedway Co. of New Jersey, Automobile Wheel and Rim Co., Belden Automobile Transmission Co., B. & L. Lubricant Co., Chicago Battery Co., CO2 Motor Co., Complete Combustion Co., Consumers' Tire and Rubber Co., Cook Kerosene Carburetter Co., Crimson Seal Lubricant Co., Cuba Motor Tally-Ho Co., Dealers' Automobile Exchange and Development Co., DeVoll Tire Co., E. A. Gantert Co., Eagle Automobile Co., Elberon Automobile Co., Empire Garage Co., Grieb Rubber Co., Guarantee Auto Supply Co., International Engineering Co., International Mfg. Co., Ivel Agricultural Motor Co. of America, Kerosene Carburetter Co., Lebanon Motor Works, McLean Automobile Co., Mobile Electric Co., Montclair Auto Station Co., Motorvehicle Co., National Flexible Shaft Co., Newark Motor Car Co., New Jersey Auto Car Co., New Jersey Touring Co., New York Broadway Rubber Tire Co., North Jersey Automobile and Engineering Co., Passaic Motor Car Co., Pneumatic Tire Shield Co., Pneumatic Tool Improvement Co., Rockaway Automobile Co., Touraine Motor Co., Trenton Auto Transit Co., Vandegrift Automobile Co., Victor Auto Tire Repair Co., White Motor Co. and Wilmot Motor and Cycle Mfg. Co.

**Fisher to Manage a Babcock Branch.**

John T. Fisher has been appointed manager of the Chicago branch of the Babcock Electric Carriage Co., which maintains in the Windy City one of the most elaborate electric garages and salesrooms in the country, at Thirty-ninth street and Grand boulevard. For the past two months Fisher has been a traveling representative of the Chicago branch, previous to which he was the Chicago manager of the Hendee Mfg. Co., of Springfield, Mass., makers of motorcycles; for some time previous to his handling of the "Indian," he was identified with the Mercedes interests in Chicago.

**THE WEEK'S INCORPORATIONS.**

Portland, Ore.—Auto Top Co., under Oregon laws, with \$5,000 capital.

Detroit, Mich.—Cromwell Motor Co., under Michigan laws, with \$1,000 capital.

Detroit, Mich.—Sterling Auto Top Co., under Michigan laws, with \$25,000 capital.

Muskogee, Okla.—Oklahoma Auto Supply Co., under Oklahoma laws, with \$25,000 capital.

Manchester, N. H.—Lebanon Automobile Co., under New Hampshire laws, with \$15,000 capital.

Kansas City, Mo.—Western Commercial Motor Car Co., under Missouri laws, with \$10,000 capital.

Manchester, N. H.—Bridge Street Auto Garage Co., The, under New Hampshire laws, with \$10,000 capital.

San Antonio, Tex.—Citizens Auto Co., under Texas laws, with \$35,000 capital; general automobile business.

Marietta, Ohio—Marietta Motor Car Co., under Ohio laws, with \$10,000 capital. Corporators—G. S. Ellis and others.

Cleveland, Ohio—Pullman Motor Car Co., under Ohio laws, with \$25,000 capital. Corporators—F. C. Thornton and others.

Philadelphia, Pa.—Bergdoll-Hall Motor Car Co., under Pennsylvania laws, with \$25,000 capital. Corporators—Albert Hall, J. Hall and C. A. Bergdoll.

Ogdensburg, N. Y.—Hannan & Henry Motor Car Co., under New York laws, with \$12,000 capital. Corporators—D. C. Henry, R. J. Henry and M. J. Coffey.

Hartford, Conn.—Hartford Automobile and Boat Supply Co., under Connecticut laws. Corporators—T. Edward Oakes, William J. Rabbitt and George J. Stoner.

Chicago, Ill.—Plymouth Garage Co., under Illinois laws, with \$2,500 capital; general garage business. Corporators—John H. McGay, John J. Downey and Isaac N. Walker.

Boston, Mass.—Motor Specialties Co., under Massachusetts laws, with \$100,000 capital; to deal in automobiles and machinery. Corporators—F. V. Stone, Newton Highlands; S. Shaw, Newton.

Peru, Ind.—Mais Motor Truck Co., The, under Indiana laws, with \$300,000 capital; manufacturers. Corporators—M. G. Cochran, E. W. Spencer, A. F. Mais, A. W. Markham and W. A. Wood.

Philadelphia, Pa.—Carlson Motor Vehicle Co., under Pennsylvania laws, with \$10,000 capital. Corporators—Philip S. Smith, Mt. Airy; Charles A. Carlson, Brooklyn, and E. U. Crosby, Germantown.

Rutherford, N. J.—Lumund Motor Car Co., under New Jersey laws, with \$150,000 capital; to manufacture automobiles. Corporators—J. Lumund, Y. Lumund, Rutherford; J. Delmonte, New York City.

Chicago, Ill.—Auto Sales Co., under Illinois laws, with \$10,000 capital; to deal in

automobiles, engines, machinery, etc. Corporators—Henry S. Hawley, E. H. Bell, C. P. Cogswell, Jr., and Victor Courtright.

Jersey City, N. J.—Ellis-Tonnele Co., under New Jersey laws, with \$50,000 capital; to deal in automobiles, etc. Corporators—A. L. Ellis, Metuchen; L. J. Tonnele, Newark, and L. E. Herrmann, Jersey City.

Syracuse, N. Y.—American Motor League, under New York laws, with \$25,000 capital; to manufacture and deal in engines, motors, motor vehicles, etc. Corporators—A. A. Schlachter, J. J. Barrett and S. G. Schlachter.

Amsterdam, N. Y.—Merriam & Howland Auto Co., under New York laws, with \$15,000 capital. Corporators—N. L. Finch, Gloversville; W. J. Merriam, L. T. Howland, L. H. Finch and C. H. Inman, Amsterdam.

Skowhegan, Me.—Skowhegan Garage Co., under Maine laws, with \$10,000 capital; to deal in automobiles and motorcycles. Corporators—William H. Norton, Skowhegan; Charles M. Hobbs and H. I. Spinney, Farmington.

Cornwall-on-Hudson, N. Y.—Hatfield Co., The, under New York laws, with \$125,000 capital; to deal in automobiles. Corporators—D. H. McConnell, A. S. Hoyt, G. W. Blanelord, C. B. Hatfield and G. G. Brown, of New York City.

Newark, N. J.—Markowsky Inventions Co., under New Jersey laws, with \$50,000 capital; to manufacture automobiles, mechanical devices, etc. Corporators—W. M. Brown, H. C. Beecher, Newark; A. Markowsky, Jersey City.

Syracuse, N. Y.—Brown-Lipe-Chapin Co., under New York laws, with \$1,500,000 capital; to manufacture differential gears. Corporators—Alexander T. Brown, W. C. Lipe, H. W. Chapin, Syracuse; C. S. Mott and H. J. Mallory, Flint, Mich.

Frederick, Okla.—Dixie Motor Car Co., The, under Oklahoma laws, with \$250,000 capital; to manufacture automobiles. Corporators—R. C. Benner, C. M. Fuller, Jr., E. I. Holt, T. H. Lindley, J. A. Piliam, Oscar M. Abt and W. E. Taylor, all of Oklahoma City.

**Increases of Capitalization.**

Muskegon, Mich.—Michigan Crank Shaft Co., increases capital from \$10,000 to \$20,000.

New York, N. Y.—Palmer & Singer Mfg. Co., increases capital from \$400,000 to \$1,000,000.

Chicopee Falls, Mass.—Fisk Rubber Co., a Delaware corporation, increases capital from \$600,000 to \$4,000,000.

Chicago, Ill.—City Motor Cab Co., increases capital from \$50,000 to \$200,000; Randolph Motor Car Co., increases capital from \$200,000 to \$500,000; Woods Motor Vehicle Co., increases capital from \$150,000 to \$300,000.

**GATHERED TO THEIR FATHERS.****George J. Bradley.**

George J. Bradley, manager of the Detroit and Cleveland branches of the Diamond Rubber Co., died at his home in Cleveland, on Thursday 27th ult., after a short illness of pneumonia. He contracted a cold in Detroit, and upon returning to Cleveland was obliged to take to his bed on Friday of the week preceding his death. After a consultation of physicians on Monday, pneumonia serum was administered, but without success. Mr. Bradley sank into unconsciousness Wednesday and remained in that condition to the end. The funeral services were held from Wade Memorial Chapel, in Cleveland, on Saturday 29th ult.

Although but 31 years old, Mr. Bradley was prominent among the men identified with the automobile business, and was one of the most valued men in the Diamond Rubber Co.'s sales organization. He had been with the company seven years, his initial experience having been that of salesman in the New York branch. Five years ago he was made manager of the Cleveland branch, and last year the Detroit branch also was placed under his management. Prior to his connection with the Diamond organization, Mr. Bradley was with the Marsh-Davis Co., of Chicago, in the cycle trade. In Cleveland he maintained a home for his mother, besides whom he leaves one sister residing in Chicago.

**Francis P. Prial.**

Francis P. Prial, editor and publisher of the Motorcycle Illustrated, and one of the best read and most gifted writers who ever penned a line for a class publication, died at his home in New York City on Monday last, January 31st. He contracted typhoid fever during the recent Madison Square Garden show and when it was believed that he would recover, he took a sudden turn for the worse, which he was unable to withstand. He was 46 years of age and unmarried. It was not because of his connection with motorcycling, however, that Mr. Prial was best known, but because of his ownership of The Wheel, which from a modest beginning became, during the heyday of the bicycle, one of the largest and most widely known and handsomest properties in the field of class journalism. Mr. Prial was personally and even intimately acquainted with practically all of the many former bicycle men who today are conspicuous in the automobile industry. During the babyhood of the latter and before it possessed a publication devoted to its interests, Mr. Prial made all arrangements to issue such a journal; he had the title selected, the drawings made and other details in hand, but finally abandoned his intention. Mr. Prial was in every sense a self-made man. The collapse of the bicycle craze cost him almost his last penny, but by industry he had regained a part of his loss.

## IN THE RETAIL WORLD.

K. Aycock, San Angelo, Tex., has embarked in the business; he has the agency for the Kisselkar.

W. G. Brown, of Triplett, Mo., has taken on automobiles and opened a salesroom. He will talk Ford cars.

W. L. Campbell, of Holden, Mo., has opened a repair shop in that bailiwick; he has the Buick agency.

R. L. Rhea, of Wichita, Kan., has opened salesrooms at 1515 Fairview avenue. He will handle the Mitchell line.

F. W. Force has "opened up" at 318 West Tenth street, Los Angeles, Cal. He is handling the Mercer car.

H. T. D. Wilson is remodeling the former Bijou Theatre building at San Jacinto street and Prairie avenue, Houston, Tex., for garage purposes.

Sam T. Hoff, of Lexington, Mo., has taken possession of his new brick garage. 30x78. He represents the Stoddard-Dayton, Mora, Crawford and Courier.

Willis C. Moore & Co., of Torrington, Conn., have embarked in the automobile business in that place; they have leased the garage which is being erected on Water street.

John T. Coffee, of Georgetown, and E. H. Von Boeckman, of Seguin, are recent additions to the Texas retail trade; the former handles the Jackson, the latter the Ford car.

V. O. Herman, of Garden City, Kan., has embarked in the automobile business in that place and is preparing to open a salesroom and garage. It will be ready for business about March 1.

Thomas Dolan, of Philadelphia, Pa., has had plans drawn for a garage to be erected at 1918-1920 Sansom street. The structure will be of brick with stone trimmings, 31½x80 dimensions.

Daniel Ripley is erecting what will be styled the Savoy Garage, at Main street and Pease avenue, Houston, Tex.; it will be a two-story structure in which modern equipment will be installed.

The Ellison Motor and Supply Co., of Haverhill, Mass., has been formed by J. O. Ellison, formerly local Ford agent, and R. F. Page, and has opened quarters in the Bradford district.

Carl L. Braun, Jr., of Lowell, Mass., has acquired an interest in the City Hall garage in Moody street, and the establishment henceforth will be operated by the firm of Smith & Braun as co-partners.

Harry Kerst, of Jersey City, N. J., has filed plans for a fireproof garage, 49.8x75, to be erected at 89 Crescent avenue. The establishment will be equipped with modern appliances and will cost \$6,500.

The Northwestern Stearns Co., which recently was formed in Minneapolis to handle the Stearns car in the Northwestern States, will act as distributing agent for

the Croxton-Keeton line also, in the same territory.

The Smith-Morgan Co., of Youngstown, Ohio, have taken possession of their new garage in East Boardman street, which is one of the largest in the city. The establishment is exclusively Buick in its trade connections.

The Overland Auto Co. has been organized in San Antonio, Tex., to handle the car of that name, and will locate in a new building on St. Mary's street. R. W. Aiken, W. H. Marsh and Walter P. Franz are the members of the company.

The Carroll Auto Co., of Houston, Tex., has leased the building at the corner of Travis street and Rusk avenue, and will occupy it as a salesroom when alterations are completed. They are Overland representatives for Houston and vicinity.

E. O. Thackson and T. J. Massey have formed the Overland Auto Sales Co., in Fort Worth, Tex., and will handle Overland and Marion cars in four counties of that State. They have opened a pretentious salesroom at 110 Eleventh street.

Garages are springing up like mushrooms, seemingly, on Farnam street, Omaha, Neb., the local "automobile row." The McIntyre Automobile Co. is the latest concern to locate on that thoroughfare; it is having built an establishment near the Smith garage.

Fifty-five electric vehicles were destroyed in a fire which consumed the garage of the Babcock Electric Carriage Co., at Rochester, N. Y., last week, which was one of the finest in the State. The blaze, which did \$200,000 damage, was caused by an explosion of gasoline.

The Field Automobile Co., of Lincoln, Neb., has opened a garage at Ninth and Q streets, which, among other things, will be devoted to the manufacture of a 30 horsepower car. It is claimed that the newcomer will have several features of more than ordinary merit.

Lapetina & Connor is the style of a new firm which has opened a garage at 1141 South Broad street, Philadelphia, Pa. They will devote considerable attention to the renting of both pleasure and commercial cars, both members having had a wide experience in this line.

J. T. Rice, of Los Angeles, Cal., who handles the Corbin, has taken possession of his new home on Olive street, adjoining the Stoddard-Dayton establishment. Since its introduction in the Angel City, the Corbin was stationed at 849 South Broadway until the recent removal.

The Monroe Motor Co., of Denver, Colo., a new firm in the Mile High City, has opened up at 1640 Broadway. Edward Monroe, of Boulder, and Peyton R. Hough are the powers that be in the concern, which will act as distributors for the Warren-Detroit and Krit cars in Colorado, Wyoming and Utah.

The Citizens Auto Co., of San Antonio, Tex., has staked a claim in the local field and is having built on Travis street a large and modern garage which will cost \$18,000, and soon will be ready for occupancy. The concern, which is organized on co-operative lines, will handle the Thomas, Apperson and Black Crow.

C. F. Roetzel, of Boonville, Ind., who conducts a foundry and machine shop, will erect a garage adjoining his present establishment. The structure will be 40x90, and will face on Third street. Equipment also is being installed in the foundry, preparatory to seeking a share of the automobile castings business.

The Mich-Stair Auto Co., of Minneapolis, Minn., has been appointed distributing agent for the Overland car for 24 counties in Minnesota and six in Wisconsin, and will have the distribution of Overland parts for the whole Northwest. The company, however, will continue to represent the Knox also as heretofore.

The West End Automobile Co., of Duluth, Minn., is to have a new home in the spring, which will be located on Superior street, between Seventeenth and Eighteenth avenues, and will cost \$15,000. It will be a brick and concrete structure, having two stories on Superior street and three on Michigan street, and will include a repair shop.

The Tidewater Automobile and Garage Co., of Norfolk, Va., has leased for a term of five years the plot at the corner of Tazewell and Boush streets, and has let the contract for the erection of a one-story brick garage, to cost \$6,000. The building will be 74x100, with its main entrance on Tazewell street; there will be a detached machine shop in the rear.

The Shelby Automobile Co., of Bristol, Tenn., is a new concern which has shied its castor in the ring from a new home erected for it at 515 Shelby street. The building, which will be occupied as a salesroom and garage, is two stories, 42x90, built of brick and concrete and cost \$6,000. The firm has the E-M-F. agency and contemplates taking on other cars.

The Arnold Motor Co., of Wichita, Kan., which represents the Auburn, Inter-State and Regal locally, has taken possession of its new garage at 215-217 South Lawrence avenue. It is a two-story structure, 50x140, and cost approximately \$50,000. The equipment includes a well appointed repair shop and electric charging plant, in which latter field the company will specialize.

The Totten Auto Co., of Rock Island, Ill., has been formed to furnish more capital and take over the automobile business of W. C. Totten, at 1708 Third avenue. With the expansion of the business several new cars have been taken on, the line now consisting of the Maxwell, Buick, Regal and Welch and the Ideal electric; a livery service also shortly will be established.

**No Piece-Work—No Over-Time  
No Nightwork—No Rush Methods**

**are permitted in the manufacture of**

# **WHITE Steam and Gasoline CARS**

**QUALITY** is the fundamental requirement in constructing White steam and gasoline cars and no manufacturing methods which might endanger quality are permitted in the White factory.

The workmen are paid by the hour—not by the piece—so there is no incentive for them to devote less time and care to any operation than is its due. No over-time work is permitted, because work so done is generally not so painstaking as it should be. We do not employ a “night shift” because in this way responsibility is divided and work done by artificial light cannot be as good as that done by daylight. Finally nothing is rushed through the White factory.

Each operation is allotted the full time necessary to secure the highest standard of quality. For example, thirty-three working days elapse between the time a body is received into the paint shop and the time it is sent to the assembling-room. Similarly, every other operation receives every care which our ten years' experience in manufacturing high-grade automobiles can suggest.

### Abandoning the Road Test.

Signs are not lacking that the pleasant days of the road tester are numbered. Already the announcement is being made by some of the car manufacturers that they are abandoning outdoor testing altogether, and testing on private test tracks at the factory was adopted some time ago by many of the makers. Deploable as the policy of having no more road testing may appear to the drivers who have been employed in the work, it has everything to recommend it to the manufacturer, and nothing to alarm the prospective purchaser of a machine.

Much of the road testing of the past has been nothing more or less than a modified form of joy riding. The drivers have betaken themselves off on long jaunts in a happy spirit of irresponsibility, have covered themselves in regard to missing hours by imaginative reports of road trouble, and have performed an actual degree of service greatly inadequate to their expense, despite the fact

that a certain proportion of them have been faithful and honest in the discharge of their duties as they saw them.

Testing on private tracks in the factory grounds has been a vast improvement for the manufacturer, tending to keep the cars and drivers under direct supervision, and indoor testing represents a still further advantage, except for the first few cars of a new and untried model. All the test that is necessary can be given on the rollers indoors, for speed and hill climbing, and if necessary the rollers may be fitted with bumps to give the effect of road jarring. One man can test several cars at the same time, and the cars can be tested complete with their bodies without damage to the latter.

As a matter of fact it is desirable for several reasons that cars be tested with their bodies on, and either road or track testing is calculated seriously to mar the bodies. In the fitting of the body and the preparing of the car for the showroom floor, there are many little mal-adjustments which may occur to the mechanism, particularly in the controlling devices, relating to ignition, gear change, brakes and the like, and if no test is given the car after the body is mounted they are not discovered before the car reaches the agent or the purchaser.

It is possible that in some cases a combination of a brief track test and an indoor test with the body on would be best. New models under trial by their designers or by experts should, of course, have their full measure of hard road work, but the more closely the testing of the general run of the cars can be kept within the factory confines, the more economical and satisfactory it is likely to be.

### Separate Contracts for Commercials.

Such big differences exist in the methods necessary for selling pleasure cars and for selling commercial vehicles that the dealer who is successful with the former may be almost useless to the manufacturer when it comes to disposing of the latter type. For this reason a certain degree of caution is being exercised by makers producing both types as to the granting of exclusive agencies for their whole lines, the inclination being to make reservations which limit the dealer to exclusive privileges on the pleasure cars alone.

Where a dealer has shown conspicuous success in pleasure cars and manifests a fair amount of promise as to the ability to place commercial vehicles he is undoubtedly entitled to the preference in getting the agency for the latter from the maker whose pleasure

cars he handles. In such cases, however, some of the more far-seeing makers divide the two classes of machines into separate contracts, so that if necessary one or the other type may be withdrawn to be put in other hands.

By their very nature the pleasure car and the commercial vehicle require a certain difference in sales methods, despite the fact that there are some customers who buy pleasure cars in a most coldly calculating spirit and an occasional commercial vehicle buyer who makes his purchase in an enthusiasm for the automobile as a progressive invention and is influenced in his choice by the glamorous reputation of the maker. In most instances the purely commercial cars or trucks are sold only as the result of marshalling logic and arithmetic in compelling array and supplementing this with the hardest kind of "plugging" and selling persistence. It is necessary to persuade the ledgers and the cost accounts that money would be saved, which is quite another matter than making a customer of a man who is itching to possess what he sees.

In the matter of temperament alone, the dealer who is an excellent medium for marketing pleasure cars may be wholly unsuited to the plodding task of canvassing prospects for motor trucks and the like, whereas a different type of man, with a capacity for figures and a determined selling method, may do well with commercials when he would be a dull bore for intending pleasure car purchasers.

Even the most experienced of the manufacturers of commercial automobiles admit that selling these vehicles is a field in which there is a comparatively limited experience to draw from and in which a great deal of trial and experiment as to methods is still necessary. It is for this reason that the makers who are building both types have reason to hold themselves as free as possible in the matter of marketing their commercial cars, avoiding the mistake of tying up their representation as the result of too inclusive contracts with their dealers.

### "Amateurs" and Motor Sport.

According to well-defined reports, the American Automobile Association intends to make the term "amateur" stand for more than a mere word in its regulations, which is in the nature of wholesome news.

Amateurism is the cornerstone of real sport, and is the only sort of sport that finally endures. Up to the present time automobiling chiefly has been distinguished by the "manufactured" article—the sort of sport that is bought and paid for and that

has money and commercialism for its beginning and its ending. It is the sort of sport that ceases when the "manufacturers" of it find it profitless or discover something that pays better. Automobile sport is but another word for such professionalism.

The amateur spirit, the love of sport for sport's sake, has been so long throttled and wet blanketed that it is rather late for the A. A. A. to set about breathing life into it; and the fault largely is the fault of the A. A. A. But it is better late than never. The success attained will be determined by the vigor of the effort and the result of the effort will determine whether a sport will remain when the present era of professionalism has run its course. The fact may not now be so apparent as it will be when that time arrives.

Proper methods of safeguarding garages against the dangers which may arise from the presence of inflammable vapors have been known for so long that it seems almost incomprehensible that such establishments should be permitted to continue when heated by ordinary coal stoves, set on the main floor in close proximity to the cars. Yet that such is the condition which exists in many garages outside the greater cities is a matter of observation to those who do much touring. The recent burning of a garage in Albany, N. Y., due to this admittedly unsafe arrangement of the heating apparatus, emphasizes the need of repeating the caution that all furnaces, forges and open-flame lights should be isolated from floors and rooms where cars are stored or repair work done. The fact that the fire in question was the second to occur in the same building and from a similar cause, points to egregious carelessness and absolute disregard of the commonest principles of fire protection. That such heedless arrangements should be permitted to continue, would seem to indicate that some traces of the old spirit of "taking chances" still remains in certain branches of the industry.

Perhaps the truth of the old proverb, "Give a dog a bad name, and it will stick to him," never was better exemplified than by the manner in which the chauffeur is made the chief target of all present-day legislation. The "gay young blade" with plenty of father's money, who is responsible for not a few "outrages," appears to be wholly overlooked.

## COMING EVENTS

January 28-February 5, Edinburgh, Scotland—Scottish Motor Trade Association's annual show in Waverly Market.

January 29-February 5, Grand Forks, N. D.—Northwestern Implement Dealers' first annual automobile show.

February 1-5, Grand Forks, N. D.—Grand Forks Automobile Dealers' first annual show.

February 5-6, New Orleans, La.—New Orleans Automobile Club's annual Mardi Gras speed carnival.

February 5-12, Chicago, Ill.—National Association of Automobile Manufacturers' ninth annual show in Coliseum.

February 8-14, Los Angeles, Cal.—Automobile Dealers' Association of Southern California's show in Grand avenue rink.

February 14-19, Buffalo, N. Y.—Automobile Club of Buffalo's eighth annual show in Convention Hall.

February 14-19, Hartford, Conn.—Hartford Automobile Dealers Association's third annual show in Foot Guard Armory.

February 14-19, St. Louis, Mo.—St. Louis Automobile Dealers Association's annual show in First Regiment Armory.

February 15-17, Washington, D. C.—American Automobile Association's national legislative convention.

February 17-19, Grand Rapids, Mich.—Grand Rapids Automobile Club's first annual show.

February 18-22, Fargo, N. D.—Fargo Automobile Dealers first annual show.

February 19-26, Los Angeles, Cal.—Licensed Association of Los Angeles' first annual show in Hamburger building.

February 19-26, Minneapolis, Minn.—Minneapolis Automobile Show Association's exhibition in National Guard Armory.

February 19-26, Newark, N. J.—Associated Automobile Clubs of New Jersey's show in Essex Armory.

February 19-26, Salt Lake City, Utah—Automobile show in Auditorium.

February 21-26, Binghamton, N. Y.—Automobile show in State Armory.

February 21-26, Cincinnati, O.—Automobile Club of Cincinnati's annual show in Music Hall.

February 21-27, Cleveland, O.—Cleveland Automobile Dealers Association's annual show in Central Armory.

February 22, Los Angeles, Cal.—Los Angeles Licensed Dealers' Association's Pasadena-Altadena hill climb.

February 22-27, Milwaukee, Wis.—Milwaukee Automobile Club's second annual show in Auditorium.

February 28-March 5, Omaha, Neb.—Omaha and Council Bluffs Automobile Dealers' show in Auditorium.

February 24-March 3, Toronto, Can.—Ontario Motor League's show in St. Lawrence Arena.

February 28-March 4, Omaha, Neb.—Omaha and Council Bluffs Automobile Dealers' show.

February 28-March 5, Kansas City, Mo.—Kansas City Automobile Dealers Association's fourth annual show in Convention Hall.

March 5-12, Boston, Mass.—Boston Automobile Dealers Association's eighth annual show in Mechanics Building.

March 5-12, Cleveland, O.—Cleveland Automobile Club's eighth annual show in Central Armory.

March 5-12, Des Moines, Ia.—Des Moines Automobile Dealers Association's first annual show in Coliseum.

March 12-19, Syracuse, N. Y.—Syracuse Automobile Dealers Association's annual show in State Armory.

March 20, San Francisco, Cal.—San Francisco Motor Club's hill climb on Nineteenth avenue hill.

March 21-28, Denver, Col.—Denver Motor Club's annual show, in Convention Hall.

March 26-April 2, Montreal, Can.—Fourth National Automobile and Sportsmen's show.

March 28-29, Savannah, Ga.—Savannah Automobile Club's 675 miles endurance run to Jacksonville, Fla.

March 26-April 2, Pittsburg, Pa.—Pittsburg Automobile Dealers' Association's annual show in Duquesne Gardens.

March 17-19, Louisville, Ky.—Louisville Automobile Dealers Association's annual show in Armory.

April 8-17, Los Angeles, Cal.—Inaugural meet on the new Los Angeles Motordrome.

April 23-29, Bangor, Me.—Eastern Maine automobile and motor boat show in Auditorium.

June 1, Berlin, Germany.—Start of Prince Henry tour, finishing at Homburg on 8th.

June 11, Wilkes-Barre, Pa.—Wilkes-Barre Automobile Club's annual hill climb on Giant's Despair, Wilkes-Barre Mountain.

July 2, Wildwood, N. J.—North Wildwood Automobile Club's roadability run from Philadelphia to Wildwood.

July 4, Wildwood, N. J.—North Wildwood Automobile Club's annual beach races meet on Ocean drive.

August 6, Wildwood, N. J.—North Wildwood Automobile Club's beach race meet on Ocean drive.

September 5, Wildwood, N. J.—North Wildwood Automobile Club's beach race meet on Ocean drive.

## RADICAL DEPARTURE IN ENGINES

Remarkable Features Contained in a Chicago Production—Fuel Injection and but One Valve Employed.

In certain classes of steam machinery, notably in boiler feed pumps, distribution of the steam is accomplished by means of valves controlled by fluid pressure. Hitherto, so far as is known, no attempt has been made to apply the principle to the internal combustion motor. The Shortt engine, which is an entirely new production, is therefore exceedingly radical. For the operation of its one valve, which controls both air and fuel inlets, is accomplished by varying the effective air pressure back of an auxiliary piston, the movement of which actuates the main valve which is attached to the same stem as the small piston. The Shortt engine, which is being produced and marketed by W. M. Ryan Co., Chicago, Ill., otherwise is of unusual construction in that it employs the principle of fuel injection, and operates upon a two-stroke, scavenging cycle.

Although the design of the motor is radical in several respects, it is the method of valve actuation, which is most extraordinary and which is the key to the operation of the system. Purely for valve actuating purposes, a differential piston is employed, the counterbore of the cylinder in which the enlarged portion of the piston works, being only very slightly greater than the main or working bore. The main or trunk portion of the piston is protected from leakage by means of three packing rings of ordinary construction, while the enlarged diameter is protected by a single ring. The counterbore of the cylinder communicates by means of a single duct with the valve chest, while a small port leads from the lower part of the counterbore to the space outside the cylinder.

The valve chest, which leads from a transfer port to the cylinder, is fitted with a single poppet valve, which has an unusually long stem leading down to a supplementary cylinder in which is fitted the auxiliary piston. The lower part of the supplementary cylinder is sealed. But into the part above the auxiliary piston is led the duct from the counterbore of the main cylinder. A light spring holds the valve upon its seat.

It is evident that as the main piston performs its stroke, a partial vacuum must be created in the counterbore at each downward movement, which is broken as the piston uncovers the second and lower port in the counterbore. This alternate depression and raising of pressure is communicated through the duct of the supplementary cylinder, where it causes the auxiliary piston to rise and fall, following the cycle of the main piston, and thus causing the opening and closing of the valve. From this point

the action of the engine as a whole is readily comprehended.

The general arrangement of parts will be seen from the accompanying illustration, in which A is the main valve, B the auxiliary piston, C the exhaust ports in the cylinder wall, D the duct which leads from the counter bore of the main cylinder to the supplementary cylinder, E the counterbore portion of the main cylinder, G the open port of the lower part of the counterbore through which the vacuum in the supplementary cylinder is broken, H the automatic air valve to the crank case and the transfer port. The connecting rod F, crank case I,

DETAILS OF THE SHORTT ENGINE

timer lever and commutator J-L, water jacket P and spark plug R fulfil their usual functions. The remaining organ of importance is the fuel injection inlet N, which, during its inoperative intervals, is closed by the main valve A.

The cycle of operations is as follows: Pure air is drawn into the crank case during the up stroke of the piston through the valve H, and is compressed upon the subsequent down stroke of the piston. Coincident with this piston movement, a partial vacuum is created in the counterbored portion of the cylinder E, the depression being communicated through the duct D to the supplementary cylinder, where air pressure beneath it at once causes the auxiliary piston B to rise, lifting the main valve A from its seat and admitting the charge of compressed air to the cylinder.

Because of the greater pressure of the inflowing air than that back of the fuel, no gasolene or oil flows from the nozzle N,

although it is uncovered as soon as the main valve leaves its seat. The early portion of the induction period thus admits only a scavenging charge of pure air to the cylinder. As the pressure in the crank case and transfer port falls, as a result of expansion, however, it at length becomes less than the pressure which is maintained in the fuel line. In consequence, injection of fuel commences and lasts until the main valve is closed.

Obviously, the main valve is held open until the enlarged portion of the piston reaches the lower end of its travel, when the partial vacuum is broken by the uncovering of the release port G, which admits air from the transfer port. Rising pressure in the supplementary cylinder then permits the spring to force down the piston B and thus to close the main valve. The scavenging and induction period thus occupies a portion of one down stroke of the piston, the instant of opening of the main valve depending on the strength of the retaining spring.

The up stroke of the piston serves to compress the mixture, ignition occurring at the usual time. The down stroke, within the main cylinder, is taken up with the functions of expansion and exhaust, the latter occurring when the wall ports are uncovered. The action within the cylinder thus is of the regular two-cycle order, save that instead of introducing the gas above the piston, as with the ordinary three-port type of engine, it enters from the top of the cylinder, preceded by a charge of pure air which insulates the live gas from the exhaust products and thus provides for a clean firing charge.

In addition to the advantages derived from the scavenging of the cylinder and the injection of fuel directly into the combustion, these points are claimed in favor of the Shortt engine: It has no carburetter, no compressed gas in the crank case, no heavy and complicated valve gear and has "perfect" lubrication. The latter function is accomplished with the aid of a single oil cup which is placed alongside the cylinder just below the exhaust ports. From that point it is fed by gravity to other parts of the mechanism, the absence of fuel or gas in the crank case materially assisting in the process, since there is no tendency for the oil to be washed from the bearings, as sometimes is the case with the regular three-port engine. The Shortt engine is manufactured in various sizes, and in one and two cylinder units. With 3 by 3-inch cylinder dimensions, the rating given to 2½ to 3 horsepower, with 4 by 5-inch dimensions, the rating is given as 5 to 6 horsepower, and the speed range is stated as 200 to 1,000 revolutions per minute.

While the Ryan company states that the engine is the result of ten years experimentation and that it has been in actual service for three years, apparently it never has been applied to an automobile, although adaptable to such use.

# THE SHOW IN THE CHICAGO FOREST

**Most Picturesque of All Decorative Schemes Promised for the N. A. A. M. Exhibition  
—Both the Eye and the Nose Will be Appealed to—But Few Cars Will  
be Displayed That Were Not Seen at New York Shows.**

For the benefit of habitual showgoers who have been annoyed by that "polished smell" which commonly is associated with brand new carriage work, be it stated that the forthcoming exhibition in Chicago will be absolutely free from such offense. All shows popularly are supposed to possess something which is termed "atmosphere"; but the show which opens in the Coliseum on Saturday afternoon of this week, at half past two o'clock, is seriously forecasted as likely to outdo all others in this, as in respect to a number of other features of greater or less importance.

Having practically exhausted the possibilities of mural decoration in previous years, or so it seemed, Manager Samuel A. Miles, whose is the strong arm which will crank the show on Saturday afternoon, has sought on several occasions to charm the visitor by assailing other of the five senses. One time the strains of sweet music wafted from the throats of trained singers assailed the ears of the crowds in the aisles. Since that memorable occasion, however, the musical program has been confined to instrumental numbers. But this year, having discovered a brand new scheme of decoration, the resourceful management has hit upon an even more unusual method of reaching the hearts of the show's patrons through another of the five gateways to the soul.

With the rugged interior of the Coliseum transformed into a waving forest, with real trees swaying in the breeze and "real" bricks forming the ornamental walls upon which will be vine-clad iron fences, the show will be wholly novel and bewildering. But to make the illusion complete and leave nothing undone, it has been decided to "decorate the atmosphere," so to speak.

The reputation of the official press agent is staked upon it that all next week the air of the Coliseum will be pervaded by a "woody" smell. In the Coliseum Annex, which will be laid out in trellis garden style, the "perfuming of the rose" will be literal as well as figurative. The First Regiment Armory, too, will have an atmosphere all its own, and perfectly natural and in keeping with the pictorial effect.

Such elaborate measures would be out of the question were it not that the Chicago show is in many respects the most important of the annual and national functions to which the public is bidden. Indeed, it sometimes is called a two-in-one show be-

cause it follows so shortly after the two New York shows, and borrows a goodly portion of exhibits with equal impartiality from each. But it is more than that.

Not a few automobile manufacturers of the middle west finding it inexpedient to journey to New York, reserve their little annual surprises for the cold snap which usually ushers in the exhibition in the Coliseum, and thereby help to thaw out the chilled visitor from the East and South. Parts and accessory makers also are to be seen in Chicago, who seldom find their way to the other "big" shows, so that if the Chicago show is anything at all, it is a three-in-one show, as well as one of the most varied of all motor car displays; it partakes a little of each of the Palace and Garden shows in New York, and is a show in itself besides.

This will be the ninth show to be held under the auspices of the National Association of Automobile Manufacturers, and, incidentally, the twelfth which has been held in Chicago since the Windy City awoke to the importance of automobile transportation and finally made up its mind that the automobile had come to stay. In point of numbers of exhibitors, the show will be of about the same magnitude as it was last year—a trifle larger if anything. But even so, it will not be big enough to accommodate all who have knocked for admittance, for the waiting list is said to be the largest in the history of the show and to contain several not unimportant names.

Of motor car exhibitors there will be just 103; the accessory people will be 141 strong, while a baker's dozen of motorcycle displays will round out and complete the display. Among the automobile exhibitors, will be 19 who were not represented at either of the two recent New York shows, while the hitherto unexhibited accessories will be shown on some two score of stands. There also will be one new display of motor bicycles.

The layout of the show, and the decorative scheme which, of course, is purely incidental thereto, involves some rather bold and unusual planning. The main floor of the Coliseum will be divided into four sections, while on the northern and southern divisions, and midway of each, will be a playing fountain. North and South of each fountain will be a huge tree, 60 feet high and covered with "real" leaves, while on either side of each tree will be a brick pillar

bearing two lamps, and surmounted by vases of flowers. At the gallery end of each section will be another tree, while surrounding the trees and bounding the spaces between them will be fencing nine feet in height.

The end of each section running east and west will be marked out by a brick wall surmounted by iron fencing. The space divisions will be of picket fencing, ending in circular picket pillars. Midway between the pillars running north and south, the aisle will be marked by rows of small decorative trees of the formal order. Vases of flowers will surmount each of the numerous pillars, while the fencing will be covered with vines.

The forest effect will be extended to the gallery, where bay trees will be used extensively, while the entire ceiling will be formed by a huge canvas, constituting the world's largest single piece painting, so it is claimed, which will be 300 feet long and 210 feet in width. Stained glass panels and oil paintings will be employed in filling vacant spaces in the annex, which, in general will be given the rose garden effect already indicated. The Armory will have a stained glass roof, walls of trellis and foliage, and will be set off by the aid of a group of four pagodas in the center of the floor; rustic railings and vases of flowers completing the scheme.

The general order of decoration is supposed to suggest an English country estate and forest. In order to accomplish the illusion, it has been necessary to drag in from the country in their entirety the "big trees" which are to ornament the Coliseum, to import from Germany the leaves, which are fire-proofed, and to perform much magic in the construction of canvas skies, staff bricks and rustic fencing that will stand the test of closest inspection. Then, there will be the delicately flavored atmosphere itself—so delicate and realistic, it is declared, that a man with a cold will suffer almost as much of a handicap as one who is color blind or is unable to distinguish between various makes of spark plug merely by the sound of the engine exhaust.

As for the exhibits which are to be so elaborately surrounded, the very fact that so large a proportion of them have appeared in New York at the two national shows recently held, is sufficient guarantee of the variety and excellence of the show as a whole. The added increment of new things,

naturally increases the element of novelty and variety which it otherwise would have.

Among the new cars, are three which never have been displayed before, two of them being of very recent production, while the others, while products already known through two or more years of service, will be of interest by reason of additions and extensions to the respective lines, or changes in design and construction bringing out the effects of new thought on some of the more difficult problems which face the motor car builder.

The original list gave 96 car makers in all, 15 of them not having exhibited at New York. Late additions, however, have swollen the total to 106, as above stated, and increased the list of newcomers by four. The complete roster of machines which will make their initial appearance this year, therefore, is as follows: Auburn, Austin, Berliet, Clark, Diamond T, Dorris, Fuller, Great Western, Holsman, Lexington, Lion, Monitor, Rambler, Richmond, Ricketts, Rider-Lewis, Springfield, Sterling and Zimmerman. The Gaeth Automobile Co., and Pierce Motor Co., which also were added to the list too late for classification, exhibited at Grand Central Palace in New York.

The Lion, which is made by the Lion Motor Car Co., of Adrian, Mich., is a car of a little more than medium power and made to sell at a little less than medium price. Its rating is 40 horsepower, and it boasts a fully enclosed four cylinder unit power plant with 4½ by 5-inch cylinders, double ignition with Splitdorf magneto, electric lighting equipment and 36-inch wheels.

The name Sterling is intended for use as a selling slogan as well as a trademark. The Elkhart Motor Car Co., of Elkhart, Ind., makers of the car of that name, have produced a machine of 30-35 horsepower rating, with 4x5-inch cylinders, 118-inch wheel base and 34 by 3½-inch tires. The motor is of the conventional, four cylinder, water cooled type and is equipped with magneto ignition as a stock feature. An original "expanding wedge" form of enclosed clutch is employed, together with axle-mounted, selective change gear affording three forward speeds.

Lexington, Ky., is the home of the Lexington Motor Car Co., which produces the Lexington car. Although it has been on the market for some little time, the Lexington has not before appeared in Chicago, or, in fact, at any other of the National shows, and hence takes its place among the brand-new cars. It is a 40-45 horsepower machine built in touring and roadster forms upon generally standard lines. In both of the two chassis models produced it stands as a rather pretentious car selling at an unpretentious price.

Among the cars which have appeared at former shows, but which are to be exhibited at Chicago for the first time this year in a roster of National exhibitors, is the Auburn, named after the Indiana town

of its origin, which, from a modest beginning a number of years ago, has been developed to a point of most creditable style in appearance and quality in workmanship and material. It is now standardized in 40 horsepower size, and possesses a number of original mechanical characteristics.

The Rider-Lewis, which makes its second bow to the Chicago showgoer on Saturday afternoon, is a six cylinder machine of 40-45 horsepower rating and many points of original design. Its motor has overhead valves of unusually liberal proportions, thermo-syphon cooling and magneto ignition. It has a self-contained lubricating system which is minus pump and piping accessories, and in addition to the regular ignition system, has provision for a double equipment using dry cells as a standby. A special form of cone clutch with cork inserts is used, together with three-speed selective gearset mounted on the rear axle. Both touring and roadster types are produced. A lighter four cylinder model of 30 horsepower but embodying many of the characteristics of the larger machine is presented for the first time this year.

Great Western cars, though a product well known throughout the central and western sections of the country, never have appeared at any of the New York shows. At this time they are shown under a new firm name, the Model Automobile Co., as its makers formerly were known, having undergone a change in name only and now bearing a characteristic more easily identified with the car, being known as the Great Western Automobile Co. The machine itself, however, is much the same as heretofore, save for a few changes in engine design which are calculated to improve its performance and economy.

Originally introduced in motor buggy form, the Fuller, which is built by the Fuller Buggy Co., of Jackson, Mich., has undergone some little alteration until the most recent models, which are propelled by a 25-30 horsepower block motor, are of standard automobile form in every respect.

It is made for the low and medium price trade, and as intended for the eminently practical user, is equipped with planetary change gear. Utility and light commercial models still are made with twin opposed engines and solid tires, but the wheel diameters are only 36 inches, and the tire sizes two inches. The Zimmerman is another machine which was introduced to the public in high wheeled form, but which gradually has assumed more standard proportions.

Another of the newcomers will be the Dorris, a well-set and original machine of the four cylinder type, which is distinguished as being one of the first to carry the unit type of power plant in which the clutch and change gear housing is suspended from the engine bed casting. The way in which the power plant is mounted is particularly ingenious. The Richmond,

which is produced by the Wayne Works, in the Indiana town for which the vehicle is named, is an air-cooled product of long standing. The Ricketts, which comes from South Bend, Ind., and therefore possesses a near-local interest to Chicagoans, was brought out a couple of years ago in the form of a standard machine with a four-cylinder motor. Last year it was shown in six-cylinder form for the first time.

One of the four foreign products numbered in the exhibitors' list, the Berliet, and the only one of the quartet not exhibited at the Grand Central Palace in New York, occasionally has been confused by the uninitiated with the domestic product of the American Locomotive Co. This is due to the fact that the latter at one time was made under license from the French builder of the Berliet. Since the Alco superceded the American Berliet in mechanical features as well as in name, however, there is small chance of error in this respect.

First in its own particular class, the Holsman, which first made its appearance at an automobile show in its home city, and at one of the early Chicago exhibitions, has been a constant feature of these expositions ever since. Of the class of first-time-this-year exhibitors, it is the only one produced by a manufacturer himself exclusively devoted to the buggy type of vehicle.

Although exhibited in New York during the two shows at a private exhibition held by the local branch, Rambler cars will have their first airing in one of the big shows of the season in Chicago. They were displayed at Atlanta in November, however, where sundry of the new features which have been introduced since last year were offered for inspection to the local visitors and to such representatives of the trade as were on the ground. For the most part these are of a minor nature, but the new clutch, which is of the expanding shoe type, is a device worth studying, both for its mechanical simplicity and apparent success of design. The Austin is another car which was on view at Atlanta, but which was not at New York. Its massive construction and distinctive appearance are well known to showgoers in a general way, since its principal characteristics remain but little changed from year to year.

Among the accessory exhibits the official list includes less than the usual number of concerns which have not previously exhibited during the present show season. Owing to the practice in the past of admitting sundry latecomers through the courtesy of space holders, however, it is practically impossible to predict exactly how many newcomers will be on hand with novelties and practical additions of one sort and another to the already long list of accessories to the motor car.

Parts and accessory exhibits always form the liveliest and in many respects the most fascinating element of the typical show, at least from the standpoint of the seeker after clever bits of invention and for the visitor

who is of the eager and credulous type for which "side shows" originally were invented. Like the outposts of the old-time circus, the accessory people are the breeziest, most persistent and most tradewise element of the whole show. The holdovers from the earlier exhibitions of a national character, together with the addition of Chicago's own peculiar contingent, invariably cause

the galleries of the Coliseum and Armory fairly to overflow with varied displays.

Among the accessory exhibitors not at New York, will be the following: Auburn Auto Pump Co., S. Breakstone, Chicago Wind Shield Co., Continental Motor Mfg. Co., Detroit Motor Car Specialty Co., Fellwock Auto and Mfg. Co., Fulton-Zinke Co., Gates-Osborn Mfg. Co., Globe Machine &

Stamping Co., Holley Bros. Co., Imperial Brass Mfg. Co., Long Manufacturing Co., Motor Specialty Co., Never-Miss Spark Plug Co., Norton Co., Overland Sales Co., Point Spark Plug Co., Ross Gear and Tool Co., Standard Varnish Works, Triple Action Spring Co., Turner Brass Works, Twentieth Century Motor Car Supply Co. and Whiteley Steel Co.

## The Exhibitors, Their Wares and Where They will be Located.

\*Exhibited at New York.

### AUTOMOBILES.

#### Gasolene Pleasure Cars.

##### Coliseum—Main Floor.

\*American Locomotive Co., New York City (F1)—Alco.  
 \*Apperson Bros. Automobile Co., Kokomo, Ind. (E1)—Apperson.  
 \*Bartholomew Co., Peoria, Ill. (H1)—Glide.  
 \*Buick Motor Co., Flint, Mich. (D6)—Buick.  
 \*Cadillac Motor Car Co., Detroit, Mich. (D5)—Cadillac.  
 \*Chalmers-Detroit Motor Co., Detroit, Mich. (B4)—Chalmers-Detroit.  
 \*Columbia Motor Car Co., Hartford, Conn. (A5)—Columbia.  
 \*Corbin Motor Vehicle Corp., New Britain, Conn. (F4)—Corbin.  
 \*Dayton Motor Car Co., Dayton, Ohio (C2)—Stoddard-Dayton.  
 \*Elmore Mfg. Co., Clyde, Ohio (C6)—Elmore.  
 \*Everitt-Metzger-Flanders Co., Detroit, Mich. (A6)—E-M-F. "30" and Flanders "20."  
 \*Franklin Mfg. Co., H. H., Syracuse, N. Y. (B5)—Franklin.  
 \*Haynes Automobile Co., Kokomo, Ind. (C5)—Haynes.  
 \*Jeffery & Co., T. B., Kenosha, Wis. (D2)—Rambler.  
 \*Knox Automobile Co., Springfield, Mass. (E2)—Knox.  
 \*Locomobile Co. of America, Bridgeport, Conn. (A2)—Locomobile.  
 \*Matheson Motor Car Co., Wilkes-Barre, Pa. (F3)—Matheson.  
 \*Maxwell-Briscoe Motor Co., Tarrytown, N. Y. (C3)—Maxwell.  
 \*Mitchell Motor Car Co., Racine, Wis. (K1)—Mitchell.  
 \*National Motor Vehicle Co., Indianapolis, Ind. (H2)—National.  
 \*Nurdyke & Marmon Co., Indianapolis, Ind. (E4)—Marmon.  
 \*Olds Motor Works, Lansing Mich. (B6)—Oldsmobile.  
 \*Packard Motor Car Co., Detroit, Mich. (C1)—Packard.  
 \*Peerless Motor Car Co., Cleveland, Ohio (A3)—Peerless.  
 \*Pierce-Arrow Motor Car Co., Buffalo, N. Y. (D1)—Pierce-Arrow.  
 \*Pope Mfg. Co., Hartford, Conn. (C4)—Pope-Hartford.  
 \*Premier Motor Mfg. Co., Indianapolis, Ind. (B2)—Premier.  
 \*Reo Motor Car Co., Lansing, Mich. (B3)—Reo.  
 \*Ricketts Automobile Works, South Bend, Ind. (L1)—Ricketts.  
 \*Stevens-Duryea Co., Chicopee Falls, Mass. (D4)—Stevens-Duryea.  
 \*Studebaker Automobile Co., South Bend, Ind. (A4)—Studebaker-Garford.  
 \*Thomas Motor Co., E. R., Buffalo, N. Y. (D3)—Thomas.  
 \*White Co., The, Cleveland, Ohio (F2)—White; steam and gasolene.  
 \*Winton Motor Carriage Co., Cleveland, Ohio (A1)—Winton.

\*Hudson Motor Car Co., Detroit, Mich. (N1)—Hudson.  
 \*Lozier Motor Co., New York City (M1)—Lozier.  
 \*Metzger Motor Car Co., Detroit, Mich. (E3)—Everitt "30."  
 \*Midland Motor Co., Moline, Ill. (Q3)—Midland.  
 \*Oakland Motor Car Co., Pontiac, Mich. (P1)—Oakland.  
 \*Pennsylvania Auto Motor Co., Bryn Mawr, Pa. (Q1)—Pennsylvania.  
 \*Royal Tourist Car Co., Cleveland, Ohio (O1)—Royal Tourist.  
 \*Selden Motor Vehicle Co., Rochester, N. Y. (Q2)—Selden.  
 \*Stearns Co., F. B., Cleveland, Ohio (O2)—Stearns.

#### Basement.

\*Black Mfg. Co., Chicago, Ill. (14)—Black-Crow.  
 \*Cameron Car Co., Beverly, Mass. (27-30)—Cameron.  
 \*Elkhart Motor Car Co., Elkhart, Ind. (44-46)—Sterling.  
 \*Fal Motor Co., Chicago, Ill. (50-52)—Fal-car.  
 \*Fuller Buggy Co., Jackson, Mich. (58)—Fuller.  
 \*Great Western Automobile Co., Peru, Ind. (31-33)—Great Western.  
 \*Henderson Motor Sales Co., Indianapolis, Ind. (41-43)—Cole "30."  
 \*Inter-State Automobile Co., Muncie, Ind. (23-26)—Inter-State.  
 \*Kissel Motor Car Co., Hartford, Wis. (11-14)—Kisselkar.  
 \*Lexington Motor Car Co., Inc., Lexington, Ky. (53-54)—Lexington.  
 \*Lion Motor Car Co., Adrian, Mich. (57)—Lion.  
 \*Metz Co., Waltham, Mass. (55-56)—Metz.  
 \*Rider-Lewis Motor Car Co., Anderson, Ind. (15-18)—Rider-Lewis.  
 \*Wayne Works, Richmond, Ind. (5-7)—Richmond.  
 \*Zimmerman Mfg. Co., Auburn, Ind. (19-22)—Zimmerman.

#### First Regiment Armory —

##### Main Floor.

\*American Motor Car Co., Indianapolis, Ind. (A1)—American.  
 \*Atlas Motor Car Co., Springfield, Mass. (G4)—Atlas.  
 \*Auburn Automobile Co., Auburn, Ind. (A2)—Auburn.  
 \*Austin Automobile Co., Grand Rapids, Mich. (B3)—Austin.  
 \*Berliet Import Co., Chicago, Ill. (E1)—Berliet.  
 \*Brush Runabout Co., Detroit, Mich. (C3)—Brush.  
 \*Buckeye Mfg. Co., Anderson, Ind. (B1)—Lambert.  
 \*Cartercar Co., Pontiac, Mich. (E6)—Cartercar.  
 \*Chadwick Engineering Works, Pottstown, Pa. (A3)—Chadwick.  
 \*Dorris Motor Car Co., St. Louis, Mo. (C1)—Dorris.

\*Fiat Automobile Co., New York City (E3)—Fiat.  
 \*Holsman Automobile Co., Chicago, Ill. (G1)—Holsman.  
 \*Hupp Motor Car Co., Detroit, Mich. (F2)—Hupmobile.  
 \*Jackson Automobile Co., Jackson, Mich. (B2)—Jackson.  
 \*Kimball & Co., C. P., Chicago, Ill. (G6)—Bodies (mounted).  
 \*McIntyre Co., W. H., Auburn, Ind. (C4)—McIntyre.  
 \*Moline Automobile Co., East Moline, Ill. (D3)—Moline.  
 \*Moon Motor Car Co., St. Louis, Mo. (C2)—Moon.  
 \*Mora Motor Car Co., Newark, N. Y. (D1)—Mora.  
 \*Ohio Motor Car Co., South Cincinnati, Ohio (G3)—Ohio.  
 \*Palais de l'Automobile, New York City (E2)—Imported cars.  
 \*Pullman Motor Car Co., York, Pa. (D4)—Pullman.  
 \*Regal Motor Car Co., Detroit, Mich. (B4)—Regal.  
 \*Renault Freres Selling Branch, Inc., New York City (E4)—Renault.  
 \*Simplex Motor Car Co., Mishawaka, Ind. (D2)—American Simplex.  
 \*Speedwell Motor Car Co., Dayton, Ohio (G2)—Speedwell.  
 \*Staver Carriage Co., Chicago, Ill. (E1½)—Staver.  
 \*Streator Motor Car Co., Streator, Ill. (F1)—Halladay.  
 \*Willys-Overland Co., Toledo, Ohio (A4)—Overland and Marion.

#### Electric Cars.

\*Babcock Electric Carriage Co., Buffalo, N. Y. (G2; Coliseum, Main)—Babcock.  
 \*Baker Motor Vehicle Co., Cleveland, Ohio (G1; Coliseum, Main)—Baker.  
 \*Columbia Motor Car Co., Hartford, Conn. (A5; Coliseum, Main)—Columbia.  
 \*Waverley Co., The, Indianapolis, Ind. (J1; Coliseum, Main)—Waverley.  
 \*Woods Motor Vehicle Co., Chicago, Ill. (B1; Coliseum, Main)—Woods.  
 \*Anderson Carriage Co., Detroit, Mich. (34-36; Basement)—Detroit.  
 \*Rauch & Lang Carriage Co., Cleveland, Ohio (G5; Armory)—R. & L.

#### Commercial Vehicles.

\*Grabowsky Power Wagon Co., Detroit, Mich. (8-10; Coliseum, Basement)—Grabowsky.  
 \*Gramm-Logan Motor Car Co., Bowling Green, Ohio (37-40; Basement)—Gramm-Logan.  
 \*Rapid Motor Vehicle Co., Pontiac, Mich. (E5; Armory)—Rapid.

#### ACCESSORIES.

##### Coliseum Gallery.

\*American Electrical Novelty & Mfg. Co., New York City (15)—Ever Ready batteries, lamps and tire specialties.  
 \*Atwater-Kent Mfg. Works, Philadelphia, Pa. (17)—Igniters and timers.  
 \*Badger Brass Mfg. Co., Kenosha, Wis.

(40)—Solar lamps and acetylene generators.  
 \*Baldwin Chain & Mfg. Co., Worcester, Mass. (64)—Baldwin chains and recoil checks.  
 \*Bowser & Co., S. F., Fort Wayne, Ind. (72-73)—Gasolene and oil storage systems.  
 \*Brown-Lipe Gear Co., Syracuse, N. Y. (36)—Transmissions, differential and steering gears.  
 \*Byrne, Kingston & Co., Kokomo, Ind. (76)—Kingston carburettors, mufflers and pumps.  
 \*Cook's Standard Tool Co., Kalamazoo, Mich. (5)—Standard jacks.  
 \*Cramp & Sons, Wm., Ship & Engine Building Co., Philadelphia, Pa. (58)—Bronze and bearing metal castings.  
 \*Diamond Rubber Co., Akron, Ohio (34-35)—Diamond tires.  
 \*Dietz Co., R. E., New York City (28)—Lamps.  
 \*Duff Mfg. Co., Pittsburg, Pa. (66)—Barrett jacks.  
 \*Edmunds & Jones Mfg. Co., Detroit Mich. (74)—Lamps and specialties.  
 \*Electric Storage Battery Co., Philadelphia, Pa. (61)—Accumulators.  
 \*Firestone Tire & Rubber Co., Akron, Ohio (67-68)—Firestone pneumatic and solid tires.  
 \*Fisk Rubber Co., Chicopee Falls, Mass. (38-39)—Fisk tires.  
 \*G & J Tire Co., Indianapolis, Ind. (44-45)—G & J tires.  
 \*Gabriel Horn Mfg. Co., Cleveland, Ohio (50)—Gabriel exhaust horns and Foster shock absorbers.  
 \*Globe Machine and Stamping Co., Cleveland, Ohio (22)—Pressed metal work.  
 \*Goodrich Co., B. F., Akron, Ohio (47-48)—Goodrich tires.  
 \*Goodyear Tire and Rubber Co., Akron, Ohio (51-52)—Goodyear tires and compressed air inflators.  
 \*Gray & Davis, Amesbury, Mass. (43)—Lamps.  
 \*Ham Mfg. Co., C. T., Rochester, N. Y. (59)—Lamps.  
 \*Hancock Mfg. Co., Charlotte, Mich. (16)—Lubricators.  
 \*Hardy Co., R. E., Chicago, Ill. (56)—Starite spark plugs.  
 \*Harris Oil Co., A. W., Providence, R. I. (41)—Lubricants.  
 \*Hartford Rubber Works Co., Hartford, Conn. (30-31)—Hartford tires.  
 \*Hartford Suspension Co., Jersey City, N. J. (20)—Truffault-Hartford shock absorbers.  
 \*Heinze Electric Co., Lowell, Mass. (63)—Magnetos, coils and ignition equipment.  
 \*Imperial Brass Mfg. Co., Chicago, Ill. (77)—Brass fittings.  
 \*Kokomo Electric Co., Kokomo, Ind. (75)—Kingston spark coils, plugs and timers.  
 \*Long Mfg. Co., Chicago, Ill. (53)—Radiators.  
 \*McCord Mfg. Co., Detroit, Mich. (60)—Radiators, lubricators and fans.  
 \*Morgan & Wright, Detroit, Mich. (26-27)—Morgan & Wright tires.  
 \*Motor and Accessory Mfrs., New York City (69)—Office.  
 \*Motsinger Device Mfg. Co., Pendleton, Ind. (24)—Ignition systems.  
 \*National Carbon Co., Cleveland, Ohio (46)—Dry cells and battery cases.  
 \*Never-Miss Spark Plug Co., Lansing, Mich. (70)—Spark plugs.  
 \*Oliver Mfg. Co., Chicago, Ill. (71)—Peerless jacks.  
 \*Pantasote Co., New York City (78-79)—Tops and upholstery materials.  
 \*Pennsylvania Rubber Co., Jeannette, Pa. (62)—Pennsylvania tires.  
 \*Rands Mfg. Co., Detroit, Mich. (10)—Tops.  
 \*Remy Electric Co., Anderson, Ind. (65)—Magnetos.

\*Republic Rubber Co., Youngstown, Ohio (12-13)—Republic tires.  
 \*Smith Co., A. O., Milwaukee, Wis. (55)—Gears and parts.  
 \*Spicer Universal Joint Mfg. Co., Plainfield, N. J. (37)—Universal joints.  
 \*Splitdorf, Inc., C. F., New York City (49)—Magnetos, coils and plugs.  
 \*Sprague Umbrella Co., Norwalk, Ohio (23)—Tops and wind shields.  
 \*Standard Roller Bearing Co., Philadelphia, Pa. (4)—Roller bearings.  
 \*Standard Welding Co., Cleveland, Ohio (29)—Tubing and electrically welded parts.  
 \*Swinehart Clincher Tire and Rubber Co., Akron, Ohio (54)—Swinehart tires.  
 \*Timken-Detroit Axle Co., Detroit, Mich. (33)—Axles.  
 \*Timken Roller Bearing Co., Canton, Ohio (32)—Roller bearings.  
 \*United Manufacturers, New York City (6-9)—Jones speedometers, horns and live maps; Connecticut coils, magnetos and switches. Sootproof spark plugs and automatic wind shields; Non-Fluid oils and grease and Weed non-skid chains.  
 \*Valentine & Co., New York City (11)—Varnishes.  
 \*Veeder Mfg. Co., Hartford, Conn. (42)—Tachometers and odometers.  
 \*Vesta Accumulator Co., Chicago, Ill. (25)—Accumulators.  
 \*Warner Gear Co., Muncie, Ind. (57)—Gears and parts.  
 \*Warner Instrument Co., Beloit, Wis. (18)—Warner Auto-Meters and clocks.  
 \*Whitney Mfg. Co., Hartford, Conn. (23)—Whitney chains and Woodruff keying systems.  
 \*Wheeler & Schebler, Indianapolis, Ind. (19)—Carburettors and magnetos.

#### Coliseum Annex—Second Floor

\*Ajax-Grieb Rubber Co., New York City (85-86)—Ajax tires.  
 \*Auburn Auto Pump Co., Auburn, N. Y. (148)—Tire pumps.  
 \*Auto Improvement Co., New York City (14)—Self-starting devices and motor specialties.  
 \*Auto Parts Mfg. Co., Muncie, Ind. (95)—Parts.  
 \*Batavia Rubber Co., Batavia, N. Y. (148)—Batavia tires.  
 \*Breeze Carburetter Co., Newark, N. J. (97)—Carburettors.  
 \*Briggs & Stratton, Milwaukee, Wis. (93)—B & S. igniters.  
 \*Consolidated Rubber Tire Co., New York City (115)—Tires.  
 \*Continental Caoutchouc Co., New York City (104-121)—Continental tires and demountable rims.  
 \*Continental Motor Mfg. Co., Muskegon, Mich. (144)—Continental motors.  
 \*Cook's Sons, Adam, New York City (99)—Lubricants and lubricators.  
 \*Cowles & Co., C., New Haven, Conn. (81)—Monograms.  
 \*Dayton Rubber Mfg. Co., Dayton, Ohio (117)—Airless tires.  
 \*Diamond Chain and Mfg. Co., Indianapolis, Ind. (21)—Chains and sprockets.  
 \*Dixon Crucible Co., Joseph, Jersey City, N. J. (87)—Graphite and lubricants.  
 \*Empire Tire Co., Trenton, N. J. (142-143)—Empire tires, brake lining and steering wheel grips.  
 \*Excelsior Motor and Mfg. Co., Chicago, Ill. (105)—Motors.  
 \*Federal Rubber Co., Milwaukee, Wis. (119)—Federal tires.  
 \*Fox Metallic Tire Belt Co., Brooklyn, N. Y. (94)—Non-skid chains.  
 \*Gemmer Mfg. Co., Detroit, Mich. (106)—Steering gears and parts.  
 \*Gilbert Mfg. Co., New Haven, Conn. (88A)—Tire jackets, lamp covers and rubber cloth specialties.

\*Havoline Oil Co., New York City (96)—Lubricants.  
 \*Hayes Mfg. Co., Detroit, Mich. (146)—Radiators, hoods and fenders.  
 \*Herz & Co., New York City (100)—Magnetos and ignition devices.  
 \*Holley Bros., Detroit, Mich. (92)—Carburettors and magnetos.  
 \*Leather Tire Goods Co., Niagara Falls, N. Y., (83)—Adjustable tire treads and non-skid bands.  
 \*Link-Belt Co., Philadelphia, Pa. (147)—Renold chains.  
 \*Lovell-McConnell Mfg. Co., Newark, N. J. (88B)—Klaxon horns.  
 \*Michelin Tire Co., Milltown, N. J. (112-113)—Michelin tires and accessories.  
 \*Mosler & Co., A. R., New York City (82)—Spark plugs.  
 \*Motz Clincher Tire and Rubber Co., Akron, Ohio (109)—Tires.  
 \*Muncie Gear Works, Muncie, Ind. (103)—Motor buggy parts.  
 \*National Coil Co., Lansing, Mich. (120)—Spark coils.  
 \*Norton Co., Worcester, Mass. (90)—Abrasive wheels.  
 \*Randall-Faichney Co., Boston, Mass. (118)—Jericho exhaust horns, B-Line grease guns and Bing spark plugs.  
 \*Ross Gear and Tool Co., Lafayette, Ind. (111)—Steering and differential gears.  
 \*Royal Equipment Co., Bridgeport, Conn. (89)—Brakes and brake lining.  
 \*Sager, J. H., Rochester, N. Y. (84)—Supplementary springs.  
 \*Shaler Co., C. A., Waupun, Wis. (116)—Electric vulcanizers.  
 \*Stewart & Clark Mfg. Co., Chicago, Ill. (80)—Speedometers.  
 \*Stromberg Motor Devices Co., Chicago, Ill. (145)—Carburettors.  
 \*Thermoid Rubber Co., Trenton, N. J. (91)—Tires, tubes and brake lining.  
 \*Turner Brass Works, Sycamore, Ill. (101)—Brass fittings and parts.  
 \*U. S. Light and Heating Co., New York City (110)—National storage batteries.  
 \*Warner Mfg. Co., Toledo, Ohio (102)—Transmission gears.  
 \*Whiteley Steel Co., Muncie, Ind. (108)—Steel castings.  
 \*Witherbee Igniter Co., Springfield, Mass. (107)—Magnetos, storage batteries and spark plugs.

#### First Regiment Armory—Gallery

\*Ajax Trunk and Sample Case Co., New York City (3)—Leather trunks and tire cases.  
 \*Apple Electric Co., Dayton, Ohio (16)—Ignition equipment.  
 \*Benford, E. M., Mount Vernon, N. Y. (30)—Spark plugs.  
 \*Breakstone, S., Chicago, Ill. (14)—Hand soap.  
 \*Chicago Wind Shield Co., Chicago, Ill. (10)—Tops and wind shields.  
 \*Detroit Motor Car Supply Co., Detroit, Mich. (2)—Bodies and tops.  
 \*Driggs-Seabury Ordnance Corp., Sharon, Pa. (33-34)—Crank shafts and frames.  
 \*Elite Mfg. Co., Ashland, Ohio (11)—Jacks and pumps.  
 \*Excelsior Supply Co., Chicago, Ill. (25-28)—Supplies and accessories.  
 \*Fellwock Auto and Mfg. Co., Evansville, Ind. (5)—Bodies, wind shields and tops.  
 \*Flentie, Ernst, Cambridge, Mass. (4)—Shock absorbers.  
 \*Franklin Mfg. Co., H. H., Syracuse, N. Y. (37)—Die castings.  
 \*Fulton-Zinke Co., Chicago, Ill. (9)—Gasolene motors.  
 \*Garage Equipment Co., Milwaukee, Wis. (8)—Wind shields, vulcanizers and bumpers.  
 \*Gasolene Motor Efficiency Co., Jersey City, N. J. (32)—Carburetter attachment.

Gates-Osborn Mfg. Co., Marshalltown, Ia. (7)—

#### Meetings Scheduled for Show Week.

Business meetings which will be held during the Chicago show are as follows: Annual banquet of the Chicago Automobile Trade Association, Friday (tomorrow) night, at the Chicago Athletic Club; regular February meeting of the directors of the National Association of Automobile Manufacturers, meeting of the directors of the Motor and Accessory Manufacturers, Inc.; annual meeting of the Detail Dealers Automobile Association; meeting of the committee of management of the American Motor Car Manufacturers Association, Wednesday, 10th inst. Several meetings of the American Automobile Association will also be held during the week.

## PORTLAND MAKES PROUD DISPLAY

### Motor Show Far Excels Last Year's Exhibition—"Pushmobile" Parade Assists in the Opening Ceremonies.

With more than double the number of exhibitors that graced the initial exposition last year, the second annual automobile show of the Portland (Ore.) Automobile Club, which was opened in the Armory on the 24th ult., and continued until the 29th, easily was entitled to the palm for the best motor show that ever has been staged in the Far West. In the splendor of decorations and arrangement of exhibits the promoters surprised themselves, while the makeup of the exhibits was of an equally high order, several of the cars on view having been shipped from the New York shows.

Owing to the freight congestion because of the recent switchmen's strike, it seemed that a majority of the exhibits would not arrive in time, but the dealers kept hot on the trail of the transportation companies and succeeded in getting most of their show cars on the scene in time for the opening, while those whose cars were delayed, solved the situation by exhibiting their demonstrating machines or borrowing customers' cars.

There were some 90 cars on exhibition, and a total of 43 exhibitors, of whom 23 showed cars. One of the cars that attracted unusual attention was the Winton Torpedo which proved such a sensation at Madison Square Garden. Another, and perhaps the most unusual exhibit in the hall was the Chalmers' stand, where was shown a pyramid composed of all the parts entering into the construction of the Chalmers "30," excepting the body. This innovation proved a powerful attraction, and served its purpose well. Strange to say, electric and commercial vehicles were conspicuous by their paucity, only one of each being displayed.

While the main hall of the Armory was sufficient last year, the assembly hall and the ballroom were impressed in addition for this year's show, and even then not all requests for space could be granted. In the main hall the decorative scheme was on the outdoor plan, which has proved so popular with show promoters this season. The floor and walls were carpeted with green burlap, while the unsightly roof girders were concealed behind a bank of blue and gold streamer bunting, the club colors. Real trees and palms were also used to further carry out the effect. On the dividing line between the exhibits were ornamental columns 16 feet high, surmounted by winged Mercury statues, while smaller posts at the entrance to each exhibit were crowned with urns of flowers. The balcony was hidden by strips of canvas represent-

ing a wooded bank, while at the crest of the bank a road wound itself between fir trees with an occasional bridge to heighten the effect.

On the opening night about 2,500 people visited the show, and there was much interest shown, and the attendance increased with each succeeding day, the fair weather contributing to this.

Perhaps no show of the season was ushered in with such novel ceremony as occurred on the Saturday night preceding the opening, when a "Pushmobile Tour," as it was officially called, was held, with boys' push wagons having imitation hoods in front. This attracted much attention, and some strenuous efforts were put forth by the various teams to land the cash prizes which were offered. An automobile parade of various types of machines from the early models to the recent luxurious creations also was held that night. Another departure was the giving by the management of number tickets with each paid admission, to be drawn after the close of the show and the winning number to entitle the holder to his choice of any \$1,000 car at the show or its equivalent in cash towards a higher price machine if desired. In order to bar all "curbstone" dealers from the show, it was stipulated that only cars maintaining agencies in Portland for a period of not less than 60 days prior to the show would be entitled to representation. The proceeds of the show will be used to purchase and erect road signs throughout the State, work having already been begun in this direction.

The list of exhibitors follows:

Automobiles—R. H. Thompson, Speedwell; Karl McCroskey, Regal; O. C. Lewis, Chadwick; Rambler Automobile Co., Rambler; Metropolitan Motor Car Co., Pullman and Acme; Barnes Auto Co., Mitchell; H. L. Keats Auto Co., Peerless, Pope-Hartford, Chalmers and Hudson; Studebaker Bros., Studebaker; Portland Motor Car Co., Stoddard-Dayton, Reo and Rapid; Robert Simpson, Auburn; Frank C. Riggs, Packard; Neate & McCarthy, Locomobile and Everitt "30"; Lloyd Automobile Co., Firestone and Columbus electric; Standard Automobile Co., Ford; Stearns Automobile Co., Stearns; White Motor Car Co., White, steam and gasoline; Western Auto Co., Knox and Moline; Charles M. Menzies, Franklin; E. E. Cohen, Maxwell; Northwestern Buick Co., Buick; Graham Motor Car Co., Stevens-Duryea and Selden; Crowe Automobile Co., Oldsmobile, Thomas, Marmon, Overland and Velje; Covey Motor Car Co., Pierce-Arrow and Cadillac, and Jackson Motor Car Co., Jackson.

Accessories—Ballou & Wright, Harry Funk, Keenan & Co., William C. McClure & Co., McCargar, Bates & Lively Co., Rogers Hub Co., Belmore, Macdougall & Moores, Pacific Coast Rubber Co., Archer, Combs & Co., R. E. Blodgett, O'Gorman & Younie, A. J. Winters and the Wallace Auto Top Co.

## PUTTING THE MOTOR TO MISUSE

**"Smart" Driving that Does Much Damage—  
Strains that It Sets up and How They  
Work Injury.**

Despite the fact that engine "flexibility" is the most desirable feature of the modern motor it is frequently misused to an astonishing degree. There are times, of course, when it is permissible to run a particular car at a mile a minute speed one moment, then slow down to two miles per hour—all this on the high gear, merely by opening and closing the throttle—but such "stunts" should be confined to salesman-demonstrators who desire to show the possibilities of the car. The wear and tear on the engine occasioned by such excessive demands on its flexibility is enormous, and enough to ruin a motor in a few months.

Going up an incline, says the Autocar, the engine of a car of 14 to 18 horsepower and average gear ratio, will, if driven on the high gear, be pulling so hard when nearing the top of the rise, that its r.p.m. are down as low as 200 to 300.

Admittedly the engine is not developing its full power, but that is not the point. The torque is very irregular, and all the working parts of engine and transmission are being subjected to a series of separate and distinct hammer-like blows. The occupants of the car can feel each impulse due to the individual explosions in the engine, though unaware of the real cause of the vibration.

It is highly probable that the driver, in order to obtain the maximum power available, will have so adjusted his ignition that the combustion of the gases commences as early as possible on the firing stroke, without actually causing that distinct series of "knocks" which arises from the ignition being too far advanced. But even granting that a knock is not apparent, there is a likelihood of damage arising or excessive wear occurring other than that emanating from the uneven torque, and a very fleeting consideration will confirm this state of affairs.

The average driver does not manipulate his ignition lever by finely graded movements; therefore when he finds, as he probably will when the engine begins to pull hard, that with the lever at a certain point—represented, for instance, by the position of six o'clock on a clock face—the engine does not pull so well as when the lever is at another point more advanced—say at seven o'clock—he will, more often than not, have allowed the lever to remain at the latter position until the ascent is completed. A knock probably did not occur. No; but when the engine was pulling at its very slowest and hardest at one spot on the hill—just at that time when the driver thought that after all he would have to change down

—there may have been, and probably was, a portion of the charge fired on the dead center, or even earlier. This amount of premature combustion did not cause a knock, but it was sufficient to transmit a comparatively violent reactionary blow to the piston, wrist pin and big end bearing and crankshaft. In effect it increased the unevenness of the torque in a similar manner to that in which an excessively high compression in one cylinder would do, and thus causes injury.

Besides this undue wear upon the machinery there is another factor to be taken into account: the ease and speed of climbing the hill. A gasoline engine develops its power in proportion to the speed—within certain limits—at which it is run, and when it is forced to thrash up a hill at a low number of revolutions per minute, full power cannot be obtained from it. The ascent could be made in shorter time, with less fuss and more comfort, if a lower gear were used. Winners of hill climbing contests admit that a great deal of time may often be saved by changing to a lower gear earlier than the average driver is in the habit of doing. This may explain, in some degree at least, why certain cars are such successful "climbers." It is probably due superiority of engine design.

Aside from possessing hill climbing abilities on "high gear," the flexible engine is intended for driving at a snail's pace through crowded streets, but here the same arguments against the misuse or abuse of the practice apply. There is again the excessively uneven torque, an increased likelihood of pre-ignition—for one cannot hear knocks caused therefrom in the thick of traffic—and, in addition, a comparatively slow acceleration, for although an engine may be flexible and pick up from 300 to 350 r.p.m. with readiness, the flexibility is only comparative, for the feature obtains still more and in an increasing ratio at higher speeds.

Another point bearing on this subject is in connection with the difficulty of changing gear down when such a movement suddenly becomes necessary at a time when the engine is pulling hard at low and decreasing speeds. On hill work the chances are that a gear will be lost, and that the change from top to low gear on a three-speed car will be necessary; momentum falls so suddenly that by the time the middle gear be engaged the car will be almost at a standstill. In traffic, if a gear be not actually lost, a fuss and noise will probably occur anyhow. Therefore, it is advisable to look upon extreme flexibility as a convenience, a stand-by, not as a feature to be habitually made use of at every opportunity. It should be understood that it is not suggested that flexibility is undesirable—indeed, it is in many ways the most important quality for an engine to possess—but an engine which possesses it should not be abused in the manner stated if good service and long life are desired.

## REVIVAL OF THE RUSSIAN SHOW

**Great Increase of Interest and Royal Approval Assures Its Success—Good Opening for American Cars.**

The automobile club of Russia has decided definitely to hold its "Third International Exposition of Automobiles and Aeroplanes" in May next in the Manege Michel, which is in the very center of the city of St. Petersburg.

The first show of this kind to be held in Russia took place in 1907 in St. Petersburg, and the second in 1908 in Moscow. No show was held last year, and meanwhile there has developed a marked increase in automobile interest and demand, not only in Moscow and St. Petersburg, but in the other larger cities of Russia.

The Automobile Club of Russia, which is behind the exposition, is at present the most powerful club in the Czar's domain. Its president is Prince Obolensky, member of the council of State; one of its vice-presidents is Captain Svetchine, aide-de-camp of the Czar, and among its members are practically all the higher officials of the army and the Empire. The exposition committee is presided over by the Grand Duke Nicolaievitch, uncle of the Czar, and thus official support, both socially and financially, is assured.

The few years of peace have had an extraordinary effect upon general prosperity in Russia. Money is more plentiful than ever before, and automobiles to the number of 3,000 roll over the improved streets of St. Petersburg. Russia, because of its poverty in great industrial plants and skilled mechanics, at present is still compelled to import practically all its motor cars it needs from other countries. George Lefevre, Delegate Generale, 10 Faubourg-Montmartre, Paris, France, will supply all information concerning exhibit on request.

The exposition will open on May 28 (March 15 in Russian calendar), and will close on June 9 (March 27 in Russian calendar).

### Los Angeles to Have Rival Shows.

Because of the organization of a licensed dealers' association composed of members who handle licensed cars, and whose action now is being followed in several other cities, Los Angeles, Cal., is to have two automobile shows this winter. The first show which is known as the "independent exhibition," will be held in Grand Avenue Rink from the 7th to the 14th, under the auspices of the Automobile Dealers Association of Southern California, which has had charge of all previous shows. It will include practically all of the dealers in unlicensed cars, and, strange to say, also a few firms whose machines are in the Selden fold, and several accessory concerns.

## LEVER SUSPENSION IN NEW FORM

Ingenious Adaptation of Old Idea and How It is Applied—Purposes Which It is Sought to Serve.

Lever suspension systems for automobile use, in which the load is indirectly applied to the springs with the idea of reducing their travel, have been applied to automobiles at various times, but without striking success, up to this time. In the Koeb-Thompson system, however, which is an entirely new adaptation of the principle, the idea has been developed in a far more elaborate way than has been attempted hitherto,

FRONT AXLE AND STEERING GEAR OF KOEB-THOMPSON CAR

NOVEL TRIANGULAR FORMATION OF KOEB-THOMPSON REAR AXLE

and with rather promising, if somewhat complicated, results. The Koeb-Thompson vehicle embodying the suspension, has just been brought out by the American Foundry Co., Leipsic, O., builders of the "American" gas and oil engines, who are preparing to manufacture it.

The most remarkable portion of the system is the rear axle and its mounting, which employs the three-quarter platform style of spring in connection with a universal method of frame mounting which is unique. Instead of the usual transverse axle member, the axle body is made in V shape, with the apex attached to a cross member of the main frame by means of a universal joint, while the wheels are carried on short stubs

protruding from either arm of the side extensions. A crossbar formed integrally with the axle body midway between the wheels and the point of attachment to the frame, forms the perch upon which the side springs are swiveled. The front end of each side spring is shackled to the frame in front, and to one end of the cross spring in the rear, as in the standard form of platform spring. The cross member, however, is swiveled instead of being rigidly perched, in the center. The result of this is that the raising of one of the side springs tends to compress both the rear spring and the side member on the opposite side of the chassis, thus the rear end of the side member on the affected side is permitted to yield slightly, this, in turn, reducing the total lift of the forward end.

Apart from the flexible nature of the suspension itself, the method of mounting imparts the peculiar quality which is claimed to give to the system the extraordinary merit it is supposed to possess. As the point of support of the side springs is approximately half way between the axle and the point of attachment of the axle member to the frame, it follows that the lift of the axle is reduced by nearly one-half when the spring supports are reached. In other words, spring deflections are just about half as great under similar circumstances as they would be with the ordinary

REAR OF CHASSIS WITH WHEEL REMOVED TO SHOW SUSPENSION

method of mounting the springs directly on the axles.

This arrangement of the axle and suspension system permits the propeller shaft, bevel driving gears and differential of the transmission system to be carried rigidly on the frame instead of being mounted on the axle. The final drive to the wheels is accomplished by means of short cardan shafts, driving directly into the wheels, much as in the Pilain and De Dion systems, which are familiar in foreign practice. In the construction of the rear axle member provision is made for ample shaft clearance, so

the accompanying pictures. The axle member or lever A, is triangular in plan, and is anchored in front by means of the ball and socket joint B on the frame. The wheels are carried on the hollow spindles D, are held in place by the nuts L, and driven by the short cardan shafts H-H1, which are jointed at I-I1. The details of the hub M, second universal J, hollow spindles and slotted opening N-N1, which permit ample play of the shafts, are apparent.

The straight frame construction is brought about by making the necessary drop in the axle member itself, instead of in

mounting. The worm R, wheel S, and springs U, U1, which relieve the shocks of steering from the arm, and the rod V, are indicated in their proper relation. From the parallelism of the steering arms, and the arrangement of the steering gear itself directly upon the axle, it is claimed that unusual freedom and ease of steering control results. This is further assisted by the flexibility of the running gear. Still another point in favor of the system, which is claimed by its makers, is that the mounting of all transmission mechanism on the frame, where it is protected from road shocks and all unnecessary vibration, greatly tends to prolong its life and so to increase its efficiency.

#### Simplicity in a Pressed Frame.

Although the art of forming automobile parts from pressed steel is pretty thoroughly understood in America, the system of frame construction employed by one of the well-known French makers would seem to be a little in advance of anything produced on this side of the water thus far, from the standpoint of the manufacturing economy. For the side members of the frame the sills are stamped into inverted U section, with side flanges turning outwardly from each of the arms of the U. The other flange is only sufficiently wide to allow room for a single row of rivets to hold the horizontal gusset plates. The inner flange however, is considerably wider, and is spread out from the waist of the chassis to the front to form a stay for the gearbox, and a complete underpan for the engine.

THE NEW KOEB-THOMPSON TOURING CAR

that the driving stubs will not strike the axle under extreme deflection, while the compensating effect of the flexible cross connection of the side and rear springs permits a perfectly straight frame to be used, in connection with ample room for spring deflection.

Further unusual characteristics are developed in the mounting of the fore part of the vehicle. The front end of the chassis is carried on a single cross spring, which is linked to the steering pivots at either end, and pivoted to the frame in the center. The alignment of the axle is maintained by means of radius rods, which are connected through ball and socket joints at both ends; the rear mounting being sufficiently below the frame when the car is standing on level ground.

As this arrangement allows unusual latitude of movement for the axle, it has been deemed necessary to alter the steering gear in order to provide corresponding flexibility. On this account the worm and nut arrangement is mounted dead in the center of the axle, and is actuated from the steering column by means of a short cardan shaft. The steering gear is of the worm and wheel type and actuates directly an arm which moves parallel to the steering arms themselves and therefore is not subject to cramping or change of effective radius in extreme lock positions. The reach rod is mounted behind the axle and is arranged with shock absorbing springs to relieve the gearing from severe stresses.

The precise details of the suspension and co-ordinate mechanism are illustrated by

the frame, as is necessary with the more ordinary forms of construction. The side spring members are attached to the axle member at the point G, the transverse bar of the axle structure at that point being

FRONT AXLE AND SPRING DESIGN

formed into a trunnion bar upon which the spring supports are clamped. This supporting point being midway between the wheels and the point of anchorage to the frame, the spring movement is reduced to half that developed at the wheels. The side springs and the rear cross member G, are shackled at E and F, and the cross member itself is pivoted to the frame at G1.

The forward mounting of the chassis involves the linking of the cross spring to the steering pivots at W, W1, and to the frame by means of the pivot X. This arrangement, together with the arrangement of radius rods back of the axle, and not shown, permits the axle to rock under the car without interference on the part of the

REAR SPRING SYSTEM

With the two cross members, one in the waist and the other at the rear, it forms perhaps as close an approximation to the one-piece unwelded frame, which so long has been sought, as anything which as yet has been produced.

#### Rigid Mounting for Oil Lamps.

Dash and tail lamps which refuse to burn properly even after submitting to a deal of careful persuasion sometimes can be cured of their stubbornness if pains are taken to see that they are relieved of all possible vibration. A loose set screw, or even a bracket which is no longer perfectly rigid, may be the cause of otherwise inexplicable shortcomings.

**"PARTS CHASERS" HELP MAKERS**

**Big Production Has Created a New Class of Field Men—Actual Experiences in "Chasing" Parts.**

On the payrolls of practically all of the automobile manufacturers making a large number of cars are men known technically as "parts chasers," but it is doubtful if the average man in the trade, let alone the public, has any idea what a "parts chaser" is or how important a personage he is in helping the manufacturer's production. When it is realized that the makers who are producing 5,000 cars or more per year each employ a corps of from ten to thirty-five "parts chasers," it is calculated to pique curiosity as to the interesting duties that members of the corps are called upon to perform.

A hint as to the parts chaser's functions is given in the name itself, as, broadly speaking, he must "chase" the parts which the automobile manufacturer is having made at outside factories, and must endeavor to see that they are delivered according to contract, or, what sometimes is more important, according to sudden changes not provided for in the contract.

"Yes, I am a parts chaser," said a man in an Eastern hotel lobby, representing one of the most prominent of the Detroit automobile manufacturers, "and a good lively job it is, too. I make this city my headquarters for the territory to which I am assigned, but I travel considerably to the smaller towns where we are having stuff made for us. There are some thirty parts chasers in our corps, five of them being located in the Pittsburg steel district alone, while the others are located in Chicago, Cleveland, Buffalo, Syracuse, Hartford, New York, Philadelphia, Rochester, Milwaukee and other producing centers for automobile parts.

"Of course the men in the steel district are steel experts, who are making constant tests of the steel products that are being made up for us, to see that they conform all along to the specifications. They act in much the same capacity as the government inspectors at a steel mill where government armor plate is being made. But in addition to their work as test experts they are required to have the ability to see to it that the factory gets the stuff it wants at the time it wants it. Some of the other members of our corps are also experts in their respective lines, being stationed at points where they are under the necessity of using their technical knowledge as well as their business sense, but the majority of us have as our chief qualifications a complete knowledge of the parts used in our car and the ability to locate the cause of a stoppage in the regular flow of their production and to make things come through.

"We are in touch with the factory every day by means of letters, telegrams and occa-

sionally by the long distance telephone, so that we know at all times just what is wanted from our respective territories. Every day when there is no special mission on hand I go around to the various plants where our parts are being made and check up just how fast they are coming along. But my work does not consist merely in having the factories tell me what they are doing and what they hope to do. With the permission of the people with whom we do business I go right out in their shops and see for myself and talk with the foremen and workmen. If there is a delay I have got to know the reason for it.

"Just a few days ago I found that there was a hold-up on some of the rods that one plant was making for us, because their stock of dies for threading the rod ends was shy, a number of the dies having been broken. I found that they had ordered new dies for the work but that the company which was to supply them had not filled the order. So I at once took the train and went to see the die makers. I landed in their office with such a jump that they were aroused to immediate activity, and in half an hour I had the dies packed up in a satchel and was on my way back with them. With the new dies the rods were finished up in short order, and there was no more difficulty on that score.

"Similarly in the case of another part requiring special clevis pins, I discovered that the people from whom the parts makers were getting the pins were not making sufficiently prompt delivery, so I took the train and went to investigate. They got busy at once and I actually saw the work of making the pins started before I left, the pins themselves arriving as promised a few days later.

At one of the plants where we are having lamps made there was a serious lagging in the deliveries, so I was called upon by the factory to remedy things. I found the lamp people ready to assist me in every possible way, and they even invited my advice and suggestions as to how they could expedite deliveries. So, taking them at their word, I roamed around their place and saw some things which I thought could be improved if the best results were to be obtained. Among other suggestions I recommended a routing of the processes so that instead of the lamps being carted from one end of the place to another, back and forth about a dozen times, for the various operations, they would move along step by step, without so much useless free riding. Changes were made in the factory arrangement accordingly and it was found to help considerably. However, it is very rare that I go so far as to suggest rearrangements of factory layouts or that I encounter factory managers who are so willing to accept suggestions.

"It sometimes happens that where we are having several parts made at one place our factory at Detroit wants the parts makers to slow down on one part and take up a more vigorous production of another. I get a letter or a telegram telling what is needed and I have got to go around and explain things to the parts maker so that he will shift the pro-

portions of his production of the various parts to suit the requirements. Sometimes these shifts are very sudden, and their necessity could not be impressed adequately on the parts maker without a man on the ground to take up the matter personally.

"With a factory making only a comparatively few cars, it is possible for the purchasing agent himself to take a little run out in case there is any delay on some part, and the plant where the part is being made will be able to drop its other work for the short time necessary to clean up the job. But in big quantity of work the case is entirely different, both from the standpoint of the car manufacturer and the parts maker, because the whole thing is a continuous high speed performance.

"Where a factory is working on the big production basis all the various parts must flow in without interruption in the proportions necessary for the full completion of the cars. If there is a delay in even the smallest part it upsets the whole system and there is figurative hell to pay, with other parts piling up in the inundating flood. That is why the parts chasers are so vital a part of the production end of the business, as through them those responsible for the manufacture and assembly of the cars can keep the parts coming in exactly the proper proportions all the time.

"Because the parts chaser is the direct representative of his factory he generally is accorded every courtesy and assistance that the parts maker can give him, though here and there his presence is apparently somewhat resented as an intrusion on sacred precincts. There are some places where it is never necessary to go further than the office, as all matters of deliveries and rush orders are taken care of satisfactorily through the office alone, but in other places it sometimes is necessary to butt right by the office into the factory to accomplish anything.

"Not a few parts plants plainly show that the factory end holds itself mightily independent of what the office says or desires, and where this situation exists there is likely to be plenty of trouble unless the matter is handled diplomatically. Cases have arisen where with the permission of the office I have gone out and seen the workmen and foremen personally and by a judicious placing of a box of cigars here and a twenty dollar bill there have succeeded in getting things through on time when the situation had seemed almost hopeless.

"Freight is not fast enough to meet some of the emergencies of the parts requirements at our Detroit factory and I am constantly sending shipments by express. Our express bills from one town alone amount to over \$7,000 per month and about \$100 per month for telegrams."

In some of the Middle West cities where parts are produced, the parts chasers are so numerous that they have little colonies or clubs of their own. Where their interests do not conflict they occasionally help each other out by following up routine matters for others who temporarily are absent on special mis-

sions. This is done by calls on the telephone, one parts chaser simulating the voice and telephone manner of the absent one as nearly as he can. On the other hand, two or more parts chasers not infrequently find themselves pitted against each other in trying to make a parts maker give their respective work the rush preference, in which situation they are given a high test of their individual ability to "put things through." Comparatively new as the parts chaser is as a fully developed and established part of the automobile industry he has proved himself so valuable that the large producer has become dependent on him as a means of direct and immediate contact with the parts and materials trade

#### Premium System at Franklin Factory.

As a means of keeping its employees up to better than "concert pitch," the H. H. Franklin Manufacturing Co. has adopted a premium system for those who do work of more than average efficiency which profits both the workmen and the company. The system affects the men of the machine shop, running gear room, final assembly room, blacksmith shop, case hardening plant, wood shop and metal body room of the factory in Syracuse, N. Y. The total number employed in these departments is about 500. When an automobile season begins and the new models are being manufactured, the average time for work on every operation is taken for a month. For each blue print there is a card bearing the same number and showing the operations necessary for the making of the part designated. The average time for each operation is put on these cards.

Every time an employe begins an operation, he is given a "premium claim" card. This shows the order number, drawing number and his machine number. On it are shown also the number of pieces started, the number completed and the time taken to complete them. Two punches of a small time register show the start and finish. If a man completes ten pieces of a certain operation in fourteen hours, when the average on the cards in the accounting department shows that two hours for each piece, or twenty hours were allowed, the saving of six hours is credited to the employe, and besides his regular pay, he receives 50 per cent. of his wage per hour for the amount of time saved. In this case, if he was earning 25 cents per hour, his premium would amount to 75 cents.

#### Enlargement of Two B. C. K. Plants.

The B. C. K. Motor Car Co., of York, Pa., which some months ago purchased a plant at Bath, N. Y., for the manufacture of its engines, has decided to enlarge the buildings at Bath by the addition of a two-story wing, 90x60, to the two-story main building, 210x60. The company also has made an appropriation of \$44,000 for new machinery, of which \$32,000 goes to the Bath plant and \$12,000 to the original plant at York.

## SHOWS AN ELECTRIC LAMP'S POWER

Automobile Lighting System Illuminates a Steeple—Result of a Night Test is Recorded by the Camera.

Such rapid development has been made within a comparatively brief period in the manufacture of incandescent electric bulbs of great brilliancy and high illuminating power that it is not generally recognized to

of Technology, Boston. A church 1,000 feet away was selected as the object on which the light should be cast, and the result is disclosed by the accompanying reproduction of the photograph that was taken. The lamp was the 10-inch diameter type, fitted with a Gray & Davis 6 v. 20 c.p. "incandescent arc" bulb and the new parabolic reflector. The bright lights behind are from the State House and the lights of the city, and the two light streaks cutting into the lamp ray were caused by stars that moved during

VIEW SHOWING ELECTRIC HEADLIGHT TEST AT BOSTON

what capacity electric lamps for automobile service have attained, and the makers of such lamps consequently have been impelled to devise striking demonstrations calculated to awaken appreciation of the merits of the more advanced types of electric lighting systems. A demonstration of this order recently was made by Gray & Davis, the veteran lamp manufacturers of Amesbury, Mass., to show the power of the new "incandescent arc light" which is incorporated in the Gray and Davis constant speed unit dynamo system for the electric lighting of motor cars. The test was conducted by Prof. Louis Derr, on the top of the Walker building, Massachusetts Institute

of Technology, Boston. The exposure of the plate, which was from half to three-quarters of an hour in duration.

#### Freezing the Tires to the Road.

When there is occasion to leave a car standing in the open for any length of time while a cold snap is coming on, it is well to do more than merely to cover the radiator with a blanket. Unless the machine is moved a few inches occasionally, there is some danger that the tires may freeze to the road. Under such circumstances, an attempt to start again, probably will result in stripping good sized chunks of tread from the several casings.

**LEGISLATURE WILL BEGIN TO GRIND**

**Only Five New Bills Now Clog It—Counselor Terry Attends Hearing and Pleads for Fairness.**

The chin music which annually is heard in the State House at Albany and which is caused by the burning desire of the lawmakers to tinker with the automobile law, was restarted on Tuesday, 1st inst., when the Assembly Committee on Internal Affairs held a hearing on the five automobile bills that already have been introduced. The principal factor at the hearing was Charles Thaddeus Terry, representing the American Automobile Association and National Association of Automobile Manufacturers, who asked the committee to exert a little common sense on behalf of the thousands of automobile owners and users in the state who annually are made a target for adverse and burdensome legislation.

Although the present New York legislature scarcely has begun its routine business, five assemblymen already have introduced automobile bills. Assemblyman Callan, of Columbia, would thrust the Massachusetts license and commission system upon the automobilists, vesting full power for the regulation of motor vehicle use with a commission of three persons. Another measure is the Dana bill, which would double the present license fees, extend the speed limit to 30 miles an hour, require the examination of chauffeurs and provide for the revocation of their licenses. The Bates bill would exact a tax on automobiles for state revenue, and the Haines measure would tax all non-residents who used the state highways. The fifth measure, known as the Joseph bill, is designed to have the license numbers made larger and displayed upon the rear of the car not less than 36 inches from the ground.

Mr. Terry spoke at length upon the features embodied in all the new measures and ventured an opinion that the present state law is entirely adequate for the protection of all those who make use of the highways.

"The trouble is that it is not enforced," said Mr. Terry. "The magistrates of New York admit it. Really the only additional legislation needed is to make better the means of identification. The license numbers should be larger, with more space between them, and they should be illuminated at night so that they may be seen at a reasonable distance."

Referring to the wear and tear of the highways by automobiles, which was suggested, Mr. Terry said that the state conceded the right of automobiles on the roads, and that it was the duty of the state to see that the highways were built in a manner to withstand new traffic conditions. He argued against a fixed speed limit if the state

sought to fix the liability for motor vehicle accidents. The examination feature of the various bills also was opposed by Mr. Terry, who said that 95 per cent. of the accidents were caused by professional chauffeurs who were well qualified to operate motor vehicles. He did suggest, however, that a provision be made to compel chauffeurs to have licenses bearing their photographs in order to make easier the work of identification.

Assemblyman Dana, Bates, Callan and Howard, naturally spoke in favor of their respective measures, while Edward J. McGoldrick, of the New York Corporation Counsel's office, opposed Mr. Bates's attempt to relieve automobiles in New York City from local taxation as personal property.

Later in the day the subject of the Allds-Hamn bills of last year was broached and it provoked a wordy discussion. Mr. Terry claimed that the measure last year was in the nature of a compromise, the main points of which were satisfactory to nearly all concerned, and finally he filed with the committee an amendment to the Allds-Hamn bill providing that cities of the first and second class shall not be deprived of the power to adopt ordinances regulating local traffic, which was the chief objection to the measure last year.

It will be recalled that the failure of the Allds-Hamn measure last year concluded a most remarkable double-barrelled campaign of automobile legislation in which the main issue was the question of speed regulation. Under the propaganda of the New York State Automobile Association two bills were introduced at opposite ends of the legislature, which differed only in respect to the speed regulations. The Allds bill provided for a sliding scale of taxation, as follows: \$4 license fee per year for cars under 20 horsepower; \$6 per year for those above 20 horsepower, and not exceeding 30 horsepower, and \$10 per year for all cars above 30 horsepower. Chauffeurs' licenses were to cost \$10 for the first year, and \$5 per year for renewals. The offense of taking another's car and using it without permission was made punishable by a fine of \$100 or imprisonment not exceeding six months. Commercial vehicles were to be taxed \$2 per year, regardless of horsepower. The most remarkable feature of the bill, however, was the total abolition of speed limits, putting it up to the operator to drive in a reasonable and not reckless manner. The work of licensing was to be transferred from the Secretary of State's office to the highway department, and all revenues to be applied by it directly to the maintenance of the state highways.

The only radical difference in the Hamn bill was that while it wiped out specific speed limits, it provided that a rate of 30 miles an hour should be considered "presumptive evidence" of reckless driving; for violation of this provision the penalties were less stringent than those obtaining

under the present law. The Allds bill finally was passed by both branches of the legislature on the strength of an emergency message from Governor Hughes. Strong opposition developed at a hearing May 11th, held by the Governor, however, at which a forcible attack was made upon it by the National Highway Protective Association and others. Later the protests from New York City officials were brought to bear, because the bill took from municipalities the power to regulate traffic by the city, and for this reason, on May 27th, after four weeks' consideration, Governor Hughes vetoed the measure.

**Edge Trying to Open New Jersey.**

Stirred by the retaliative measures of other states the motorists of New Jersey are making another effort to amend the pernicious non-resident clause of the automobile law of that state, which exacts a fee from motorists of other states who may wish to enter the state for short periods. Assemblyman W. E. Edge, of Atlantic City, and a prominent motorist of that place, has introduced a bill providing that motorists of other states who have complied with the automobile laws of their respective states, may use the roads of New Jersey for not more than three periods of ten days each in any one year, without registering their cars in that state. It is further provided that the last day of the first period and the first day of the second period, and so on, must be thirty days apart and that cars must bear their own state numbers only. The bill has the support of all the automobile clubs of the state, but it is expected that Senator Freylinghuysen, author of the present law, will arise and block the measure, as he has done on past occasions when similar amendments were offered as he believes that everyone should "pay something."

**Wilkes-Barre Saves Its Hill Climb.**

Despite the opposition of a strong faction of the club, who were opposed to the organization holding any more hill climbs, the Wilkes-Barre (Pa.) Automobile Club, after consulting with the business men of the town, has applied for a sanction for another running of what has come to be recognized as the national hill climb on Giant's Despair. Instead of being held on Decoration Day, as in former years, and on which day Wilkes-Barre has been the Mecca for Eastern tourists, this year's climb has been set for Saturday, June 11. This change of date is in the nature of a surprise, as also is the club's decision to again hold the climb this year, as it was thought that the internal opposition would carry their point. When Wilkes-Barre relinquished its claim to the national climb last year, the Worcester (Mass.) Automobile Club made a bid for it to take place on May 30 on Dead Horse hill, where in years past several climbs have been held. The Worcester contest will occur on June 4.

**A. A. A. ARRANGES CONTEST DATES**

**Tentative Schedule that will Prevent Much  
Confliction—Earlier Dates for Several  
of the National Events.**

Announcement was made late last week by the contest board of the American Automobile Association of a tentative schedule of sanctioned contests of various sorts throughout the country for the coming season, which it is planned to make the greatest season of competition in the history of the sport in this country. Applications were filed for nearly 100 events of various kinds, and of these 76 were from clubs or promoters east of the Rocky Mountains, while 22 were requisitions from the Pacific Coast. It is likely that several more will be granted later. According to the schedule as at present constituted, the East will have 32 track races, 22 reliability contests, 13 hill climbs and and nine road races, while the portion allotted to the Pacific district comprises of 13 track events, six road races and two hill climbs.

All of the old classics have been retained, but several of them will be held earlier than ever before, among which is the National A. A. A. tour, the new name for the Glidden trophy contest, which will get under way June 15 and finish on the 30th; the Vanderbilt race on October 1, and the Riverhead, L. I., road race on June 1. The headliners, which will be repeated, are the Cobe Cup race on June 25; Lowell races on September 5, and the Fairmount Park race, Philadelphia, on October 8. Savannah, Ga., also has applied for a sanction for a road race late in October, presumably another Grand Prize contest, but no definite date yet has been assigned.

It is possible that there will be but one twice-around-the-clock race at Brighton Beach, N. Y., this year, May 30 being the only date assigned to this track. The racing clans will gather at the Atlanta, Ga., Motordrome on May 5, 6 and 7. Indianapolis is booked for a choice string of dates—May 29, 30 and 31; July 1, 2 and 4; August 12 and 13; September 2, 3 and 5, and the windup on October 7 and 8. Atlanta's curtain will fall one week later, on the 15th.

On the Pacific slope all the big events are booked again, including the Santa Rosa Roadrace on May 9; the Portland, Ore., Rose Festival road event on June 11; the Mount Baldy event on September 10, and the notable Portola race at San Francisco on October 23. The new board Motordrome at Los Angeles also is well provided for, with 10 meets carded. The complete list of sanctioned contests is as follows:

**Road Races.**

Denver, Denver Motor Club, May 30.  
Riverhead, Motor Contest Association, June 1.  
Cobe, Chicago Auto Club, June 25.

Grand Rapids, Grand Rapids Auto Club, middle of July.

Denver, Denver Motor Club, September 5.  
Lowell, Lowell Auto Club, September 5.  
Vanderbilt, Motor Cups Holding Co., October 1.  
Fairmount Park, Quaker City Motor Club, October 8.  
Savannah, Savannah Auto Club, ———

**Hill Climbs.**

Atlanta, Atlanta Journal, February 22.  
Kansas City, Auto Club of Kansas City, April.  
Bridgeport, Auto Club of Bridgeport, May 30.  
Wilkes-Barre, Wilkes-Barre Auto Club, June 11.  
Worcester, Worcester Auto Club, June 4.  
Cleveland, Cleveland Auto Club, June.  
Ossining, Upper Westchester Auto Club, June 18.  
Plainfield, Plainfield Auto Club, July 11.  
Richfield, Richfield Springs Auto Club, middle of July.

## RIVAL TYPES OF SPRING SUSPENSION

Views of the Spring Makers Themselves as to the Respective Merits of the Various Systems—Growing Use of the Three-Quarters Form—Why Experts Favor the Full Elliptic—The Battle of Theories—Special Designing for the Car Manufacturers—The Absence of Decided "Trend."

Just how the springs are fabricated and mounted between the frame and axles seldom concerns the occupant of the average well-made car. A jolt is a jolt, to be sure, and much touring, even at the present day, tends to develop hitherto unsuspected tender spots about certain much jiggled portions of the body. But as a rule it is the peaceful road mender who is blamed for the unpleasant sensations, rather than the builder of the car. To dodge behind the automobile manufacturer himself and deliver a few well-chosen anathemas at the specialist who constructed the springs is far too complicated a method of mental revenge to occur to the ordinary every-day motorist.

Happily, persons of analytical mind, as well as sensitive anatomy, early began tinkering with the problem of automobile spring design. In consequence of their cogitations and subsequent labors, the world has been blessed with countless shock absorbers, sundry and intricate systems of suspension and as many more methods of shackling the more or less generally approved forms of springs at present recognized as available for the desired purpose.

Nor has the united effort of many busy brains been wholly in vain. The net result is that car mechanisms as a whole and car bodies in particular now last a great deal longer than formerly was the case, which result is due partly to better application for the principles of design in other respects, but very largely to the easing of shocks from vital parts. Furthermore, it is now possible to discover an occasional complacent individual who believes that American roads are better on the whole than they used to be. This latter conclusion may be justified in some measure. But at all events it is certain that the springs are better than they used to be—which is a polite way of begging a delicate question.

But while the springs of the modern car cause the passenger no discomfiture, but rather alleviate much of the suffering which he has reason to expect under certain circumstances, it is a fact perhaps not generally appreciated that they are a source of considerable perplexity to the thoroughgoing and painstaking engineer. The proof of this is not far to seek, when attention is called to the frequent alteration in spring design, undertaken by even some of the most thoroughly established automobile manufacturers in the industry, as well as

to the wide variety exhibited in existing practice at the present time.

In connection with the recent automobile show in Grand Central Palace, the Motor World called attention to some apparent tendencies of the time, and more especially to the rapidly increasing application of the three-quarter elliptic rear suspension on cars of widely divergent sizes and types. At the same time some of the more pertinent characteristics of the system in question were presented in a cursory way.

A more extended consideration of the subject, which was made possible by the second show in New York City, together with sundry statistics gathered in connection with the exhibits at the Palace and Garden, affords the somewhat surprising information that spring design at present is in quite as unsettled a state as ever it has been since the early period when the word "trend" was rooted out of the dictionary and translated by the ubiquitous press agent to the columns of the trade-wise and technical press.

That this is due in part to the generally recognized theory that spring suspensions are not subject to standardization in the same way as other parts, may be the case, though there is insufficient evidence to warrant the assumption. The design of each individual make and type of car warrants the production of a special spring equipment to fit it, is the belief held by many engineers. But while this is true to a large extent, it also is true that each recognized type of suspension may be found on practically all types of cars, large and small. This indisputable fact leads to the conclusion that a more or less significant battle of theories is in the air, or else that there is an equality about the various systems which none of their respective supporters are likely to be ready to admit.

Without regard to the type of vehicle upon which they were mounted, and considering the various models of practically all the makers exhibiting at the two New York shows this winter, it was found that a full 25 per cent. of the suspensions were of the semi-elliptical pattern, both front and rear. Adherents to the semi-elliptical spring in front and the full elliptic in the rear, produced about 20 per cent. of the vehicles at the two shows. The cars mounted on full elliptic springs, both front and rear, amounted to only 9 per cent. of the total, while the semi-elliptical front and three-quarter platform rear system was used on 15 per cent. of the cars; unclassi-

fied types making up only about 4 per cent. of the total. The latter include such well-known and successful systems as the double cross spring mounting of the Ford, the rear cross and semi-elliptical front arrangement of the Hupmobile, the helical suspension of the Brush runabout and several unusual combinations of otherwise familiar forms of spring. The remaining 27 per cent. of the total list of cars considered, reveals the present strength of the three-quarter elliptic rear suspension when used in connection with the semi-elliptic front spring. As before indicated, this form of spring, like each of the others specified, is to be found on cars of practically all types from the medium powered machine of say 25 actual horsepower or thereabouts upward, and without apparent limits as to power or weight; though it is most popular with the builders of cars ranging around 30 horsepower.

Noting the apparent concerted movement among a large number of makers—more than one-third of the number actually exhibiting, as a matter of fact—the Motor World instituted a canvas among the spring manufacturers themselves, in an effort to discover, if possible, whether a decided leaning to the three-quarter elliptic form, or, indeed, to any form at all, existed in that quarter. Somewhat unexpectedly, in view of the extent to which the car makers draw upon the spring makers for their equipments, as upon specialists of recognized ability, a majority of the replies received expressed a decided preference for the full elliptic type.

Standing as they do in the light of expert consultants, it was not surprising to find some inclination to professional reticence upon the subject. As one well-known spring maker expressed the situation: "We practically design the car as far as the suspension goes, and we practically relieve the designer of that disagreeable duty; we go to his office and do it." And in explanation of his disinclination to state his preference for any one form of spring, he said: "Different cars require different types of suspension, according to the use they are designed for. That is our stock in trade; to go to the designer's or engineer's office and discuss it with him." Just as a cautious medical practitioner may hesitate to commit himself publicly in regard to the symptoms of some peculiar physical ailment, this man-behind-the-man-behind-the-car was unwilling to have his name appear over a criticism of any one

type of spring, lest his guarded assertions be subject to too broad a construction.

And it is noteworthy in passing, that this sheds some light on the peculiar confidential relation existing with other parts specialists in many factories today. The parts people of the better class are more than mere builders of components; they exercise a sort of paternalism over the nominal car manufacturers, of which the average motorist never dreams, but for which he should be devoutly thankful.

As requested, the replies to the Motor World's inquiry concerning the spring situation are non-technical in form, dealing in a rather more direct way with the results which are to be expected from one type of suspension or another. The extracts printed below reveal as concisely as possible the present attitude of the spring makers themselves in regard to spring design:

Harvey Spring Company, Racine Junction, Wis.—"It is certain that springs for wagons and carriages never set the spring-making fraternity thinking so hard as springs for automobiles. This, of course, is due to the greater strain put upon the springs as a result of the smaller wheels and the greater speed of the automobiles. However, a great many things have been learned the last few years that are overcoming a great deal of the trouble. A definite amount of work must be done by the spring in absorbing the shocks of the road and the proper distribution of this work along the full length of the spring. If this work is concentrated in only part of the spring, it is almost sure to break the spring at that point.

"The recent tendency has been to use longer springs and straighter springs and wider springs with less leaves. Of course, the longer spring must be heavier to carry the load, and this provides more steel to do the work of the spring. This relieves the center of the spring from the excessive strain. The tendency to use springs with less arch or curvature also tends to distribute the action along the length of the spring rather than concentrate it at the center.

"As to the style of springs, we think the elliptic spring is the best, as one half relieves the other half. The scroll end elliptic is even better than the regular elliptic spring, particularly as an easy riding spring for light roads. Next to the elliptic spring we would take the three-quarter elliptic or the platform suspension which is about the same thing.

"To sum the whole matter up, we would say that our experience has taught us that it is desirable to put plenty of material in the spring to properly do its work. This material must be properly arranged so as to distribute the stress throughout the entire length of the spring.

"Few people appreciate how many fine points must be considered in designing a spring for a car. The length, the breadth,

the grading of the leaves, the shape, the quality of the steel and the temper all influence the ultimate result."

Hess-Pontiac Spring and Axle Co., Pontiac, Mich.—"In regard to the tendency of automobile manufacturers to adopt three-quarter elliptic springs in the place of semi-elliptic, we would say that our experience with manufacturers seems to indicate that the demand must be for a car with the three-quarter scroll elliptic construction in the rear, as quite a number of those who are changing their construction this year are changing to this style of suspension.

"It is our opinion that for medium heavy and heavy cars the three-quarter scroll elliptic spring for the rear suspension is one that is capable of filling the requirements as well as anything that we know. The design of the chassis can be so arranged as to make the lower or bottom half of the spring of extra good length, which insures good riding qualities; and the upper half of the spring, while taking the place of the drop frame end, helps also in reducing the shocks and gives it better riding qualities.

"For a light and cheap car, we think that the best and cheapest construction is the half elliptic, a plain spring which can be made to accommodate itself for length of wheel base, and if designed for length, will give excellent riding qualities. Some consider the full elliptic of better design for cheap cars, and for some reasons we recommend it in place of the half elliptic, but in our estimation it does not make as neat a finished car."

Kalamazoo Spring and Axle Co., Kalamazoo, Mich.—"We regard the regular full elliptic spring as the best form of spring for use on motor driven vehicles, and wherever this form can be utilized, we make our recommendation accordingly. In certain types, of course, this spring cannot be used, and the three-quarter type is then to our minds the next best. Both the full elliptic and three-quarter elliptic are now being called for with scroll ends similar to our Nos. 202½ and 204. This type spring is considerably harder to make than the regular elliptic, and we, as spring makers, naturally lean to the regular type on this account. The scroll pattern, however, when properly made gives very satisfactory riding results, and thus far has proven reliable as to durability: The semi-elliptic style does not give nearly as much flexibility as the elliptic type, and for this reason we do not regard the semi-elliptic type as quite as desirable either in the matter of riding qualities or durability."

The Hess Spring and Axle Co., Carthage, Ohio—"The style of spring which survives the test of time is the best, the same as in all other things. The semi-elliptic spring lends itself better for front spring suspension on the modern constructed automobile, and for the same reason the full elliptic, with scroll ends, or the three-quarter ellip-

tic, with scroll ends lends itself favorably to the present construction as a rear spring.

"We consider the three-quarter or full elliptic scroll spring as being superior to the half elliptic as a rear spring suspension, because it is easier to get length of elasticity sufficient to give an easy riding spring and to stand the shocks. Nothing but length gives satisfaction in difficult work such as an automobile requires.

"So in a general way we would advise: First, make the springs as long as possible; second, make the springs as wide as possible; third, make the spring leaves as thin as practical; fourth, so space and multiply the leaves as would give the action and carrying capacity required."

Detroit Steel Products Co., Detroit, Mich.—"We have always questioned the wisdom of using the three-quarter elliptic spring for rear suspension for heavy vehicles. The use of this upper scroll adds to the volume of the spring maker, and, to that extent, is desirable to him, but we believe the automobile manufacturer is adopting it too generally. For heavy and high-duty cars, we do not advocate its use. For light cars, the question of high efficiency and lateral motion is not of so much consequence.

"Our idea is that the semi-elliptic pattern, properly designed, and where the collateral construction is fitted to such proper design, instead of the reverse, as is usually the case, is the safest and best for general practice. Automobile manufacturers are beginning to realize that, in order to secure the highest efficiency and excellence, they must give the spring maker plenty of latitude, and not limit him to the previously adopted collateral construction."

The Lewis Spring and Axle Co., Jackson, Mich.—"Owing to the fact of the low wheels causing such a constant and severe strain on the springs, the only proper mode of construction is a full elliptic front and rear. Semi-elliptic and especially a three-quarter elliptic are more subject to crystallization than the full elliptic.

"The best way of hanging is under the axle, thus doing away with the constant hammering which is inevitable when it is on top. Another advantage of this method of hanging is the natural tendency all the while of drawing the top and the bottom together, making the car ride easier, adding to the elasticity of the spring and lessening the danger of breakage."

#### When Washers May Cause Trouble.

In reassembling an engine after roadside repairs have been performed, it is important to see that all washers and gaskets are wiped free of dust and grease before being put back into place. Failure to carry out this precaution may involve considerable and annoying delays through leakages, which, if in the intake side of the engine, may prevent it from running properly, even though the improper union may be practically impossible to locate.

## NOVELTY IN LUBRICATING SYSTEM

### How Maxwell Obtains Fixed Regulation for Individual Feeds—Details of the Ingenious Device.

Lubricating systems have come to assume such importance in the estimation of a considerable number of automobile manufacturers that they are producing their oiling devices in their own plants along with other vital parts of the mechanism. In general where this practice prevails, the lubricator supplies only the engine, and is incorporated directly in it. The Maxwell-Briscoe Motor Co., Tarrytown, N. Y. however, is one of those companies building a pressure feed oiler of the external type. It is of original construction and is applied to all models of the line as produced at this time.

NEW MAXWELL OILER

Besides being of very compact and altogether unusual construction the new Maxwell lubricators possess the merit of having fixed regulation for the individual feeds, so that the supply to each of the feeding points is retained in fixed proportion to each of the other feeds regardless of the speed of the engine or the adjustment of the main regulating screw.

The system comprises what may be called a double pump arrangement, one of the two sections, which is a complete gear pump in itself, feeding to the sight glass which is mounted on the dash. From that point a regulated amount of oil flows back to the pump, whence it is delivered to the other sections of the device, which in addition to

its function as a pump also acts as a distributor. Because the distributing section

VIEW SHOWING DIAPHRAGM VALVE

of the pump is arranged to deliver only measured quantities of oil to each of the feeding points, it follows that in the event

tube A, as shown in the illustration of the oil pump body, the meshing of the teeth of the gears E and F preventing the progress of the lubricant beyond the point G, so that the teeth of gear E are made to carry it around in the direction of the arrow. An automatic by-pass arrangement causes the pump to deliver through the tube B, leading to the sight feed glass only sufficient oil to satisfy the adjustment of the valve P. The pumping capacity of the gears is considerably in excess of the normal requirement for lubricant. The surplus is taken care of by the diaphragm valve passing into the hole I, from which it is discharged into the chamber J. Ordinarily the diaphragm K closes this chamber, but when the pressure rises above the normal the diaphragm yields and allows the overflow to escape into the opening M, from which point it is returned to its original starting point at B.

From the sight feed the oil is returned

SECTIONAL VIEWS SHOWING STRUCTURAL AND OPERATING DETAILS.

of a stoppage in either of the delivery outlets, the oil at once will "back up" into the sight feed glass where its presence will furnish an immediate indication of trouble. Similarly, of course, any failure in the supply of oil, clogging of the feeding section of the pump, or failure of the driving mechanism, at once will be revealed by the cessation of flow through the glass. This trouble indicating property of the sight feed as well as the ease with which adjustments to the entire system may be made without opening the bonnet are the more important merits of the system.

Its mechanical features are revealed by the accompanying illustrations. The oil enters the sight feed gears, so-called, from the

to the pump at T, where it is distributed by the aid of the gear W, around which it is carried in the direction of the arrow U, and forced into the channel Z. It passes out at the opposite side of the gear, W, and is led through the channel A to the hole b. By the movement of the pump actuating mechanism, the hole b is carried around and registers successively with the feeding orifices c, d, e, f, g. Through the corresponding passages, i, j-k, l-m, n-o, and p-q, the oil is fed to the four cylinders, taken in this order, and to the clutch. As the holes in the pump body are unequally spaced, it follows that the quantities fed to the respective bearing surfaces are graduated in proportion to their absolute requirements.

## VARIATION OF MULTIPLE JET IDEA

How It is Employed in a Foreign Carburettor—Clear Exposition of the Principles and Operations Involved.

Despite the many improvements and devices introduced during the past few years, the effort to obtain more perfect carburetters continues. Of these efforts the most promising appears to be the introduction of an auxiliary jet to at least reasonably proportion the quantity of "gas" admitted to that actually needed. Such adjustment, to be of real value, ought to be perfectly automatic, and it is the problem of reliable automatic control that offers the greatest difficulties to the designer. Several good multiple jet carburetters are on the market, but even their designers are not resting content.

A device of this class which has undergone severe tests and which is declared to be highly effective and growing in favor, is the Zenith carburetter.

It is of the float feed spray-jet type, such as is practically universal on all modern cars. It has, however, two concentric jets instead of a single jet; these jets are shown side by side for convenience in the accompanying diagrammatic sketch.

Gasoline from the float feed chamber flows to both jets simultaneously, but there is a peculiarity in the arrangement of the passages to the jets that must be very carefully studied, for it constitutes the basic feature in construction. The passage between the float feed chamber and the main jet communicates through a small orifice with an auxiliary chamber, from which the second jet draws its supply of fuel. This auxiliary chamber has a very small capacity, relatively smaller, in fact, than could conveniently be shown in the diagram, and is open to atmosphere; both points are of great importance.

When in action, a suction effect is being exercised on the orifice of each jet simultaneously and equally, due to the rush of air from the induction pipe to the engine. There is an equal suction on each jet, but it does not follow that the discharge from the jets is equal, because, while the main jet is drawing its supply from the large float feed chamber that is maintained at a constant level, the second jet is drawing its supply from the relatively small auxiliary chamber, the level in which depends on the relative rates of discharge from the jet and inflow from the small orifice.

The rate of inflow to the auxiliary chamber is itself determined by the difference in level of the fuel in the auxiliary chamber and in the float feed chamber; there is an absolute maximum rate of inflow limited by the area of the small orifice. This only occurs when the gasoline is ejected from the second jet as fast as it can flow

into the auxiliary chamber. Under these latter conditions the suction on the second jet is working against a resistance represented by the height of the jet itself, whereas the suction on the main jet is working against no resistance at all since there is never any measurable difference in level between the fuel in the float feed chamber and in the stem of the main jet.

If the rate of inflow through the small orifice to the auxiliary chamber is greater than that of the discharge from the second jet, the auxiliary chamber will fill up, and if the suction on the second jet is very slight, it is assumed that the level in the auxiliary chamber is appreciably the same as that in the float feed chamber. Under these conditions the auxiliary chamber is no more than a part of the float feed cham-

ZENITH CARBURETTER CONSTRUCTION

ber, so that the main jet and the second jet discharge equal quantities of fuel in a given time, assuming that they are equal in size. As has been stated, a slight suction on the jet is an essential condition to this state of affairs, and such suction implies a low velocity of air through the mixing chamber, and this in turn indicates that the engine is either running very slowly indeed with an open throttle or that the throttle is almost closed if the engine is running fast. In any case the conditions imply that the power developed is slight.

The important feature of the carburettor action in this connection is that the second jet has come to the aid of the main jet at a time when the main jet by itself might have failed to afford adequate carburation of the air. The change that has taken place is somewhat analogous to enlarging the bore of the main jet.

The suction of the second jet must be sufficient to work against the difference of level represented by the height of the jet stem. This implies a suction of very considerable magnitude, such as could only be obtained by a high velocity of the air through the mixing chamber. A high velocity through the mixing chamber will be produced by high engine speed, but also may be produced at low engine speed if the throttle is fully open to allow the cylinders to receive a full charge.

For ordinary touring car work it may be assumed that high engine speed is intend-

ed to be accompanied by a partially closed throttle, because it is not usual for a touring car engine to be driven "all out" on the level. When, therefore, an engine is running slowly on an open throttle, and fast on a partially closed throttle, it may be developing the same amount of power although in a different way. In the first case, torque or "pull" predominates, in the second case speed is the more in evidence.

Whatever may be the feature of the power developed, it indicates the consumption of the fuel at the same rate per minute. In the first case the fuel is consumed in a few strokes of the piston, in the second case it is divided up among many strokes, each stroke contributing, of course, proportionately less work.

There are two compensations that must essentially be provided by any carburettor that claims to be automatic. One is a compensation for variation in engine speed accompanying constant power, and the other is a compensation for variation in load accompanying constant engine speed.

The exact proportioning of the parts so that the compensation is accurate is a matter requiring some considerable experiment, but that after all is no more than is required in the case of any carburettor, and it is claimed as the great feature of the Zenith that the compensation once attained does not involve the introduction of a single mechanical moving part.

The small-bore pipe shown in the accompanying diagram is a clever device to facilitate starting the engine. Its lower orifice is submerged below the level of the gasoline in the auxiliary chamber when the engine is at rest, and its upper orifice occurs in the induction pipe on the seating of the throttle valve. At this point there is sure to be an appreciable suction even when the engine is at rest, and its upper orifice occurs sequentially carburation takes place under conditions that would hardly be adequate to set the jets in action. It is essential to the successful operation of this device that the engine be started with the throttle nearly closed.

### "Reclaimed Rubber" Gets in Free.

In consequence of a protest filed by the Michelin Tire Co., of Milltown, N. J., the Board of General Appraisers, at New York City, has decided that "reclaimed" or "recovered" rubber is to be admitted from other countries free of duty. The Michelin company's protest was made concerning a shipment where the Collector had assessed some of the merchandise at 30 per cent. ad valorem as "manufactures of rubber" and the remainder at 20 per cent. as a "non-enumerated manufactured article."

"If crude rubber cleansed and purified," the Board declares, "is entitled to free entry we think on the same basis of reasoning that reclaimed or recovered rubber which by various processes, chemical or otherwise, has been reduced from old scrap to the crude state, is also entitled to free entry."

## SNOW DELAYS GRAND FORKS SHOW

Opening Takes Place a Day Later than Scheduled—Northwest Dealers Make a Brave Display.

With dealers from all parts of the state and from other states, as well, exhibiting cars, the first recognized automobile show in North Dakota worthy of the name is occupying the boards at the Auditorium in Grand Forks this week, being held in connection with the Northwestern Implement Dealers' convention. Although scheduled to open on Monday of this week the show was a day behind time on account of a heavy snowstorm which tied up the railroads, postponing the arrival of several show cars and their exhibitors, so that the show did not get under way until Tuesday. However, there is no doubt but that it will be an annual fixture, for the city is crowded with more people than ever before, a great number of the visitors being out of town agents. It is practically an agents' show, very few of the manufacturers being represented directly.

While nothing elaborate has been attempted in the decorative line, the hall is made ornate with red, white and blue bunting used in profusion, while ferns and evergreen are scattered throughout the building, the whole making a very pretty effect. There are 26 makes of cars shown, of which two, the Billy Four and the Deal, are shown for the first time this season. The former is a Southerner, hailing from Atlanta, Ga., and is a small reproduction of the advanced type of large car. It has a four cylinder block motor rated at 20 horsepower, thermo-syphon cooling and self-contained oiling system. The clutch is of the cone type and the transmission, which is of the selective sliding pattern, has two forward speeds with the usual reverse. Final drive is by shaft with semi-floating rear axle. There are three brakes, a service brake mounted on the drive shaft back of the transmission and a pair of expanding brakes on the rear axle.

While the implement dealers' annual gathering always attracts large crowds to the city, the addition of an automobile show has this year attracted more people than ever. The show closes on Saturday, 5th.

The exhibitors are as follows:

Automobiles: Grand Forks Motor Car Co., Kisselcar; Dakota Auto Co., Reo, E-M-F, Chalmers, Velie and Stearns; A. A. Anderson, Mitchell; L. Stimson, Overland; Lyons & Co., Franklin, Hupmobile, Maxwell and Excelsior motor cycles; Sims Auto Co., Buick; Northern Auto Co., Jamestown, Brush; Horton Motor Co., Devils Lake, Oakland; Baird & Sandlie, Lakota, Billy Four; Inter-State Auto Co., Lakota, Inter-State; Spoonhein Bros., Northwood, Halladay; Robert J. Moore, Grafton, Studebaker; J. A. Scott, Rugby, Winton. From Minneapolis, Minn., the Northland Motor Co., Stoddard-Dayton; Jackson Motor Co., Jackson; Col-

umbus Buggy Co., Columbus electric; Haynes Auto Co., Haynes; P. J. Downes, Rambler; La Crosse Implement Co., Deal, and Sullivan Bros., E. Grand Forks, Minn., Mason.

Accessories: Monley & Smith, Grand Forks; Fargo Auto Supply Co., Fargo; C. J. Smith, St. Paul, Minn., and Hudson & Thurber, and Hollis Electric Co., Minneapolis.

### Radical Details in Magneto Design.

Taking principles and methods of magneto construction which are essentially conventional and conservative, but adding design features which are unusual and radically advanced, the Connecticut Telephone & Electric Co., of Meriden, Conn., is presenting, through its sales representatives, the United Manufacturers, a new type of high tension magneto. Instead of a double wound armature or the use of a single winding and a separate coil on the

dash, the Connecticut magneto, a view of which is shown in the accompanying illustration, has its transforming or secondary coil placed in the bow of the magnets. This coil is in cartridge form, so that in case of a burn out or "breakdown" immediate repairs can be made by inserting a new coil, in the same way as substituting a new unit in a spark coil.

An unique feature is the provision of four safety gap windows. In case one of the cylinders is missing, the spark immediately will begin to jump across the window corresponding with the missing cylinder, so that the operator of the car can see at a glance in which cylinder there is trouble. Simplification in construction and the reduction of the number of parts has been accomplished at many points. Ball bearings are used throughout, and the magneto cannot be short-circuited by too much oil as there is a special drain which carries off all excess. The whole device is fully enclosed so that it is water and dustproof, and it may be changed from right to left hand running by the simple change of three screws.

Special emphasis is placed on the fact that the magneto produces a satisfying spark at an exceedingly low engine speed. For city driving in traffic this quality is particularly valuable, as it avoids the necessity for frequent gear change or for switching over to the batteries.

## AIDS TO EASY ENGINE STARTING

Methods of Properly Priming the Motor—Difficulties that Result from Flooding—Effects of Fuel Excess.

If there is any one thing the inexperienced motorist is bound to overdo, it is in flooding the engine when it refuses to start promptly, under the misguided impression that flooding and priming are the same thing. Concerning this subject, the Co-Operator has a few useful words of advice to impart, which not a few "novices" of maturer development, well might take to heart. For it is to be observed, that not infrequently, even a motorist of experience, when "flustered" is prone to have recourse to priming, as a general remedy for all ailments to which the gasoline engine falls heir.

"Priming a gasoline engine effectively is one thing, and flooding it another," observes the print in question. "Priming is injecting a rational charge of gasoline into the cylinder to assist starting; flooding is to supply more than is needed. The first operation generally makes starting easier, especially in cold weather, or when a poor grade of fuel is used. Flooding makes starting extremely difficult and often impossible.

"Many motorists, especially the inexpert, often inject considerable fuel in the cylinders, and then find it practically impossible to get a good explosion from the motor. In such an event one may think not enough fuel has been supplied, so another dose is put in through the pet cocks, or spark plug openings. Again the crank is turned with poor results and finally, after considerable expenditure of labor, the engine may give one or two explosions. Encouraged by this more gasoline is injected, and again the motor cannot be made to run.

"The proper remedy if the motor will not start after a reasonable amount of fuel (it need not be more than a thimble full, or the amount contained in the usual ball end of the priming cock), has been supplied, is to open the pet cocks and turn the engine over briskly for a few turns with the compression taps open. This allows the engine to draw enough air to form an explosive mixture. When the sharp hiss that denotes an explosion is heard, the pet cocks should be closed and the engine turned over against compression. No priming will start an engine with dirty spark plugs, weak batteries, or other ignition troubles. Flooding the cylinder with gasoline is worse than not supplying enough. It is advised to saturate a bundle of cloth or a sponge with gasoline and place it over the air intake of the carburetter when there is any difficulty in starting, this being even better than priming. Under no consideration should waste be used for this purpose as particles may become detached and be drawn into the manifold or carburetter."

## CONCERNING THE WEAR OF TIRES

**Braden Points Out the Sort of Care and Use that Reduces Upkeep—Remarkable Instance of Equal Wear.**

"Automobile owners who are interested in the up-keep cost of their cars—and there are very few who are not—sometimes fail to take everything into consideration in figuring the cost of their tire service," says J. A. Braden, of the Diamond Rubber Co. "If one tire should happen to blow out for one cause or another after, say 2,500 miles of service, the user is likely to think of that fact only. Probably he doesn't recall that one of the other tires gave 6,000 miles, the third 7,000 miles and the fourth 8,000 miles. Failing to take this into consideration, he may get a mild grouch and want to 'do things' to the company that furnished the tires.

"It is obviously impossible for all tires to meet the same road conditions. All tires will not hit the same stones; all will not run in the same rut; all will not skid in the same car track. There are countless obstructions in every mile of road, paved or otherwise, and it's plain that one tire will hit some and another tire hit others, injury resulting to one and not to the other. Bearing this point in mind, it seems a fair conclusion that tire experience should be based on the average service of all four tires and not on the service of any one tire, be it good or bad.

"In the illustration cited the user, whose tire blew out at 2,500 miles, had an average service of 5,875 miles when the work of his other three tires is considered.

"Rear tires get much more severe work than front wheels, and the wear and tear on them is such that they cannot be expected to last as long as the front casings, but they sometimes do. An instance of this sort recently was reported to us by F. W. Conrad, of the Pacific Garage, Montesano, Wash., who used a six cylinder, seven passenger Franklin car last year, with one set of Diamond tires, and by actual odometer record obtained this mileage: Left front tire, 9,420 miles; right front tire, 9,348 miles; right rear tire, 9,188 miles, and left rear tire, 9,179 miles.

"It is not often that such authenticated records are obtainable, and for that reason they are of real value. It will be noted that the mileage of the poorest tire was only 241 miles lower than that of the highest, and the average for all tires was 9,281¼ miles. Mr. Conrad did not volunteer the conditions under which he was able to get an average service so nearly the same on our different tires, and the Diamond Rubber Co. does not know. It may have been due to any one or all of several reasons. Undoubtedly Mr. Conrad drove his car carefully and conservatively—no sudden throw-

ing on of brakes, no skidding round corners. He may have, as many do, shifted the back and front pairs at the proper time and thus have gotten extended service. In this connection care must be exercised not to make the change after either set is too much worn. And he also probably saw to it that all of his tires were kept pumped up hard all of the time; pumped up hard enough to stand full and round under a maximum load—a point very essential in getting maximum mileage."

### Dynamometers Within the Reach of All.

At one time regarded almost in the light of a luxury even for an automobile manufacturer, the dynamometer is undergoing a popularization which is bringing it not only into

the factories where cars are made, but into garages and other establishments where motors and cars undergo repairs, alterations or tests. Among the latest of the types especially suitable where both cost and space limitations are involved, is a fan dynamometer which is being placed on the market by Joseph Tracy, of New York City, who in the past has been better known as a race driver than as a consulting engineer. As shown by the accompanying illustration it is essentially a metal standard carrying a horizontal steel shaft with an overhung two-bladed fan at one end and a universal joint connection for the motor at the other. The shaft is carried in heavy ball bearings and has a belt pulley for driving a special tachometer mounted on the top of the shaft housing.

Direct readings in horsepower are given on the tachometer, from a minimum of 1 horsepower at 480 r. p. m. to 70 horsepower at 1,980 r. p. m. An inner scale, concentric with the horsepower scale, gives the r. p. m., so that simultaneous horsepower and r. p. m. readings are obtained without the necessity for computation. While the device as ordinarily supplied is designed for the testing of motors and cars of medium power, its capacity may be changed by the use of different fan blades and suitable tachometer scales.

## THE PEOPLE WHO PURCHASE CARS

**Statistics that Bear on Interesting and Much Mooted Points—The Many Cars that Change Owners.**

"Where do all the cars go?" is a question that is asked frequently by not only the man in the street, but, rather more interestedly, by the motor car manufacturer. It is an easy matter for his shipping or sales department to tell the latter into what territory the cars have gone, but unless he makes a more thorough study of the situation than that he will be at a loss to know just who buys the cars.

At least one company can answer the question and answer it down to the fraction of a per cent. Not long ago the Pierce-Arrow Motor Car Co., of Buffalo, began a systematic inquiry along this line among the dealers. Their sales of new models by January 1st, 1910, were such that practically the whole of the present year's output, including the cars not yet manufactured, could be used in the statistics.

One result was the bringing out of the remarkable fact that for this year exactly 47.5 per cent., or practically half of the output, goes into the hands of former Pierce-Arrow owners. Of the remainder 35.6 per cent. are bought by those who had owned cars of other makes, and 16.9 per cent. to those who had never owned a motor car before. The sales of the year before were as follows: to former owners of Pierce-Arrow cars, 43.0 per cent.; to former owners of other cars, 34.6 per cent.; to those who had never owned a car before, 22.4 per cent.

As the output of cars by the Pierce-Arrow Motor Car Co. has increased steadily and probably will continue to do so as long as the present high standard of efficiency is maintained, it would appear that the company can depend almost absolutely every year on half its output being taken by owners who had already had experience with cars of this make.

To analyze the matter still further, it is evident that Pierce-Arrow owners buy a new car on an average of a little over two years, and that there is not a great deal of merit in the notion that a man usually first purchases a low priced car and, as he gains experience, buys one of a higher grade. The Pierce percentages show that 16.9 and 22.4 per cent. of the two years' outputs were taken by people who had never owned cars before.

To assist in mixing the ingredients of the gas, one foreign expert has hit upon the simple expedient of inserting a spiral spring made of plain wire in the intake pipe. The coils of the spring act as baffle plates by causing the gas to be thoroughly agitated in passing over them.

## BALL BEARINGS VS. PLAIN ONES

Experiments that Developed Some Interesting Figures—How the Tests Were Conducted and the Deductions.

While it is comparatively easy to show the advantages of ball bearings as compared with the plain type of bushed bearings, from the standpoint of theory alone, it is sometimes difficult to convince the "rule o' thumb" man that the theoretical advantage will work out in practice. Perhaps as a result of some such difficulty, a British investigator recently undertook a demonstration on the road of the difference in resistance to vehicular movement offered by wheel bearings of the two types in question.

The experiment was purely a coasting one; that is to say, the same vehicle, equipped with first one type of bearing and then with the other, was permitted to coast down an incline and onto a rise, the distance of its travel in the various tests being compared, as well as the times occupied in transit. As would be expected, the ball bearing equipment carried the car the greatest distance in each instance. But for the average of all the tests, it is somewhat surprising to find that the advantage of the more approved form of mounting was only 3.5 per cent. in the time required to cover the first 20 feet of travel, and only 3.1 per cent. for the total run. In regard to the method of conducting the trials, which was of the simplest form, the experimenter himself says:

"It was eventually decided to use a motor lorry which was available. This was a petrol-driven car with side chains of a type suitable for loads up to three tons. The wheels were fitted with ball bearings of the standard type of a well-known firm of ball bearing manufacturers. On the inner side of the hub was a large journal bearing, in the centre a double thrust bearing, and on the outer side another journal of somewhat smaller size than the first-mentioned. The plain bearings used in the test, which were specially made for the purpose, were of that type in which a loose floating bronze cage is interposed between the hub and the axle. In this case, however, the axle being designed for ball bearings and tapering towards the outer end, it was necessary to make two special sleeves, one fitting tightly inside the hub shell and the other on the axle, in order to form a parallel bearing—this by way of explanation of the method employed to convert the same set of wheels from one type of bearing to the other.

"As a venue for the tests a spot was selected on a quiet road where a slight 'dip' occurs, with a down grade of approximately 1 in 20 to begin with, this leading to a piece of level ground, and thence to a rising gradient."

A starting point, designated as "A," was chosen on the first rise, and at a second point,

B, a line was drawn across the road and this point was 20 feet from A. The distance from A to D, on the second rise, was carefully measured, and from a third point, C to D, a number of small stakes were driven into the side of the road with a spacing of 3 feet between them, and each one was marked its distance in feet from the starting point, A.

"The lorry, loaded with 2½ tons of pig-iron, was made to 'toe the line' at A, and held at that spot by the foot brake until, with the gear lever in the neutral position, the word to go was given," continues the investigator. "By gravity alone the vehicle immediately ran forward, and was allowed to 'coast' as far as it would do so towards point D, the time occupied in traveling the first 20 feet (as far as point B) being taken by means of a stopwatch.

"The records obtained were: (1) Time in seconds running first 20 feet, and (2) total length of run in feet.

"Twelve runs were first made with ball bearings fitted; the wheels were then removed and plain bearings substituted. Then twelve more runs were made with the latter type.

"The road was in good condition and dry, and there was practically an entire absence of wind. Both series of tests being made on the same day and immediately succeeding one another, the prevailing conditions were identical. Castor oil was used as a lubricant for the plain bearings, this having been found previously to be more suitable and to give better results than either ordinary lubricating oil, grease, or a mixture of both.

"The tabulated results under these conditions were as below:

Run No.	Ball Bearings		Plain Bearings	
	Time First 20ft. Sec.	Total Run Feet.	Time First 20ft. Sec.	Total Run Feet.
1	10¾	575	11	558
2	10¾	578	10	561
3	9¾	575	10¾	556
4	10	570	10	555
5	10¾	578	10¾	565
6	9¾	579	10¾	561
7	9¾	577	10	562
8	10	578	10¾	558
9	10	577	10	557
10	10¾	577	10	555
11	9¾	580	10¾	556
12	10	578	10	564

Average time first 20 feet—Ball bearings, 9.9s.; plain bearings, 10.25s.

Average length of run—Ball bearings 576 feet 10 inches; plain bearings, 559 feet.

"The advantage shown by the above is, as might be expected, with the ball bearings, but the writer was very surprised to find that the percentage in their favor but 3.5 per cent. in the time for first 20 feet and only 3.1 per cent. in the length of run. It should be mentioned, however, that in the back wheels only were the plain bearings fitted, the ball bearings being in position in the front wheels during both series. But even if the percentages are doubled for this reason they still show but a small advantage in favor of the ball bearings compared with what one would expect.

"It will be noticed that the greatest advantage is in, what may be termed, the 'acceleration test, viz., time covering first twenty yards. The writer would have imagined that the reverse would have been the case, that the ball bearings would have scored to a greater extent on the total distance, in covering which the speed for a period was comparatively high, say fifteen or sixteen miles per hour."

### Why New Tires Need Frequent Inflation.

Arguments in favor of the practice of testing tires for pressure, and inflating them to the correct degree at frequent intervals are numerous, but perhaps the most important is this: It is claimed that after inflation, the oxygen in the air tends to separate from the other components of the atmosphere, and as oxygen is diffused through rubber much more rapidly than nitrogen, the principal remaining constituent, it follows that after repeated inflations, the gas within the tire is relatively of a much more stable nature than when the inflation is first completed. With a new tire, it is especially important to re-inflate at frequent intervals because the pressure of the air tends to stretch the casing, thus increasing its capacity very materially. Therefore, with new tires or newly inflated ones, it is by no means safe to assume that a tube properly inflated one day will be sufficiently hard the next.

### Drip Pans that Interfere with Drainage.

No criticism can be offered against the prevailing practice of automobile manufacturers of protecting the under parts of the car by means of substantial drip pans. Indeed, it is only within a very short time that the construction of such protecting arrangements has been brought to a point of really commendable utility. At the same time, from the standpoint of the operation, it is well to point out that in many machines this very provision renders it more or less difficult to drain the crank case, and incidentally tempts the careless chauffeur to postpone the periodic cleaning of the engine, which is an essential to good running results. To provide means for running the drip cocks below the under pan, or to insert hand-hole openings in the bottom of the pan itself, would be expedients entailing slight expense but materially expediting attendance upon the car.

### "Caravan" that Suggests a Hotel.

The most interesting and unique car shown at the recent Brussels show, was a Pipe caravan, with a six cylinder motor of 4 inch bore by 5 inch stroke. It is chain driven and has twin pneumatic tires on the rear wheels. The front part is very similar to a wagonette, but the rear portion looks more like a hotel 'bus. The back body lets down to a horizontal position forming a platform on which a table and chairs can be arranged, meals served, or couches placed for sleeping.

### To Keep Show Windows Clear.

A Western man, who has charge of his firm's show windows and who declares that he tried all known remedies, and despaired of keeping the windows clear during cold weather, says he accidentally found the solution in the form of an electric fan. "I had become wearied with using glycerine, alcohol and other things, and one day discovered that a current of air circulating through the windows would keep the frost down," he writes. "You see the constant opening and shutting of the door to the street always chilled the warm air in the show window, and as we did not have double windows, frost always hid our goods from the passerby. I start the fan when I come down in the morning, and inside of an hour the window is as clear as in the summertime. The circulating air keeps the chill air from striking the pane, and in order to always keep the air moving, I keep one door to the windows partly open all the time, which also aids in preventing all the hot air from being pushed against the cold window. I tried my fan treatment when the mercury was five below zero and it works beautifully. Besides, there is an advantage, for the pedestrian, seeing the fan operating at this time of year, wonders what is up, and stops to look and frequently to ask questions."

### To Repeat Climb in San Francisco.

Arrangements are being made by the San Francisco (Cal.) Motor Club to hold a hill climb on the Nineteenth avenue grade on Sunday, March 20. The club held a climb on this course last spring which brought out a large field and good time was made and it is planned to make the coming affair more of a success if possible. The hill is not particularly severe, but was selected as the most desirable one in the vicinity because of the excellent vantage points which spectators are afforded, it being possible to see the start and finish from the sand hillocks which line the course on either side. These also afford a natural grandstand being sufficiently high to assure spectators immunity from injury should a car leave the course.

### Where Travel is Treacherous.

Country travel during the winter and spring months is rendered especially unpleasant by reason of the treacherous condition of the ditches and turf by the roadside. Experienced drivers have learned to resist the temptation of leaving a muddy road for an inviting stretch of smooth grass in a neighboring field. But the novice in many instances has yet to learn that they are pitfalls for the unwary and liable to prove far more dangerous when the frost is leaving the ground than the more forbidding highway itself.

### Why Cleveland's Cars are Yellow.

The municipal authorities of Cleveland, Ohio, have adopted a color scheme for all

the motor vehicles owned by the city, orders having been issued that all of the city's cars be painted bright yellow with blue trimmings. While the prevention of "joy riding" was supposed to be the object of this move, it is naively explained that the main reason for adopting these colors is that the city officials expect the city cars will have the right of way after they have been painted in the official colors, and the department heads who use the cars will thus be able to save considerable time; in other words, the colors will assist the officials to break the speed law.

### France a Poor Automobile Country.

Official records recently compiled by the fiscal authorities of France sharply accentuate how slow has been the growth of automobiling in that country and how relatively small is the number of cars in use at the end of ten years; it is less than half the number in use in New York State alone, and this, despite its grand roads and the fact that the population of France is some 40,000,000. The most remarkable feature of the statistics is the growth of the commercial vehicle, which is, so to speak, now on the heels of the pleasure car. The official figures disclosing this state of affairs are as follows:

Year.	Industrial Vehicles.	Private Cars.
1899.....	234	1,438
1900.....	543	2,354
1901.....	939	4,427
1902.....	1,849	7,358
1903.....	3,062	9,207
1904.....	4,588	12,519
1905.....	6,532	15,911
1906.....	8,904	17,358
1907.....	11,685	19,601
1908.....	15,338	22,252

In 1908 the average horsepower was 13.25; in 1901 it was but 5.06.

### Why a New Anti-Smoke Ordinance.

Drivers of cars in Washington, D. C., whose machines emit smoke and pungent fumes anywhere within the city limits, now are liable to arrest under the provisions of a new police regulation. Although a somewhat similar ordinance was in force before the present ruling was made the old ordinance applied only to certain streets in the downtown section, and when a motorist was arrested for allowing his car to emit smoke he was discharged in court, the judge ruling that the ordinance was invalid because it discriminated in favor of certain streets. With this loophole in the law revealed the authorities got busy on a new ordinance which was made effective, throughout the city.

### Endurance, Not Speed, for Savannah.

The Savannah Automobile Club, Savannah, Ga., will endeavor to console itself over the demise of the Grand Prize race, with a two days endurance run in the early spring, March 28-29 being the dates selected. Jacksonville, Fla., will be the finishing point of the contest, which will be 675 miles in length.

### To Help Sale of Good Wines.

A hundred years ago good wines were plentiful in rural France, and the country innkeeper served as fine a Burgundy as could be obtained at the best hotel in Paris. But the advent of the railroad, and particularly of the "express trains-de-luxe," which rush by all places having under 100,000 inhabitants, killed good wines all over France. The advent of the automobile promised to re-establish the old conditions in country inns, but cellars cannot be improvised, and tourists soon became disgusted at having newly bottled wine passed on them as old stuff. They started to drink mineral waters. Now the Touring Club of France has taken the matter under its paternal care and is endeavoring to help the pendulum swing back once more to better wines and better inns, by offering prizes to the landlord for good wines and hygienic bedrooms. It is hoped that the good old days when one could sit at the big tavern fire with a bottle of fifteen-year-old Burgundy will soon return—thanks to the efforts of the Touring Club.

### Hartford to Hold Two Shows.

For the first time since it has attained the importance of having an automobile show, Hartford, Conn., is to have two shows this year, both running at the same time, February 14-19, but in different places, under different management, and not as rival exhibitions. The third annual show of the Hartford Automobile Dealers' Association will be held in Foot Guard Hall, as in former years, but there were a greater number of prospective exhibitors than ever who were unable to obtain space. It was to take care of these unfortunates that the Connecticut Automobile Show Association was organized to provide a building in which they might exhibit their products. One of the members of the new association, James H. Clarkin, recently bought the old First Regiment Armory, on Elm street, from the State, and it is here that the auxiliary show will be held.

### Glassless Goggles for Spectacled Motorists.

Glassless goggles for spectacled drivers, to keep rain from blurring the glasses, constitute a recent English invention. They are devoid of lenses and consist simply of two short tubes with open ends set in a frame, fitting tightly against the face. The air entering at the open outer ends forces a compressed air cushion against the eyes, which neither cold wind nor rain seems to penetrate. The eyes are kept warm and the spectacles dry.

### Lakewood Re-dreams Its Dream.

Lakewood, N. J., for the 107th time, more or less, has resurrected its speedway proposition and again threatens to construct a motordrome on a plot of ground on the outskirts of the town. Capt. A. M. Bradshaw one of the pillars of the town, is said to be the father of this "novel" project.

## RECENT PATENTS.

939,391. Ball Bearing. William E. Cane, Toronto, Ontario, Canada, assignor to William John Murray, Toronto, Canada. Filed Nov. 9, 1908. Serial No. 461,773.

1. In a double ball bearing, the combination with an outer ring having an annular groove and an inner ring having an external annular groove, of the minor and major balls and a floating cage comprising the sides having concave recesses held against the major balls where the surface speed of the balls is the slowest, blocks adapted to hold the contacting points of the minor balls adjacent to the contacting points of the major balls and extending between the sides of the cage and having rectangular projecting ends so held and fastened in the side rings of the cage, so as to hold the rings together and each minor ball and its contacting point with the major balls on a line passing through the center thereof and of the major balls adjacent thereto as and for the purpose specified.

939,856. Carburetter. Ralph Papanti, Springfield, Mass. Filed Sept. 25, 1908. Serial No. 454,673.

1 A carburetter comprising a casing, a valve support connected to the casing, a skeleton cap fitted to the valve support, a nipple formed on said cap and provided with a feed duct, a valve adjustably mounted in the cap, a spray nozzle removably fitted in said cap, a partition formed in the cap and provided with a central opening, a valve seat ring disposed between said partition and a shoulder on the valve support, a needle valve for the spray nozzle, a disc valve secured to the shank of the needle valve, a convolute spring interposed between said partition and said valve seat ring, a spring for seating the disc valve, and an air valve connected to the casing.

939,910. Magneto Generator. Robert H. Hassler, Indianapolis, Ind. Filed March 23, 1908. Serial No. 422,840.

1. In a device of the class described, a cylindrical support providing a lubricating reservoir, a series of magnets arranged about the axis of the support and projecting at one end to form a multipolar magnetic field, a shaft in the reservoir and carrying an armature in the said field, and means whereby the shaft may be revolved.

939,914. Transmission Gear. William S. Hovey, Three Rivers, Mich., assignor to The Sheffield Car Company, Three Rivers, Mich. Original application filed Jan. 14, 1907, Serial No. 352,222. Divided and this application filed Nov. 2, 1908. Serial No. 460,691.

1. The combination of a driving shaft; a chambered fly wheel open at one side; a revolubly mounted longitudinally adjustable member having a hub projecting into and rotatably and slidably mounted on the hub of said fly wheel; a plurality of friction discs arranged within said fly wheel and connected to revolve therewith; a plurality of friction discs connected to said hub and of

said adjustable member to revolve therewith, interposed between said discs connected to said fly wheel; a clamping disc revolubly mounted on the hub of said adjustable member and adapted to bear against the outer friction disc; a plurality of coiled springs arranged to hold said adjustable member normally outward; a thrust ring for the inner ends of said springs arranged in

said fly wheel; projecting pins on said thrust ring arranged to engage the hub of said adjustable member; an annular plate projecting inwardly from the rim of said fly wheel between said clamping disc and said adjustable member; and means for shifting said adjustable member.

MOTOR COMPANY

BROADWAY CORNER 84TH STREET  
NEW YORK

TRADE MARK "RAINIER" NEW YORK  
W U AND LIEBER CODES

January 12th, 1910

J. S. Bretz Company

Times Building,

New York City,

Gentlemen:-

I want to congratulate you most heartily upon the efficiency of the F. and S. ball bearings, which I believe contributed in no small degree to the wonderful success of the Rainier stock car in its racing engagements during the year 1909.

At the Riverhead, L. I. tournament I drove the Rainier car a total of more than 1000 miles including preliminary practice, and on the Brighton Beach Race Track the same car surpassed the previous 24 hour race record by traveling 1115 miles in the run "twice around the clock".

At the Atlanta, Ga. tournament I drove this car a total of 625 miles in race events, exclusive of almost as great a distance in practice, and won the \$10,000. Atlanta Gold Trophy with a world's record of 200 miles in 173 minutes, an average of 70 miles an hour, without a stop.

The Rainier car is fitted throughout with F. and S. ball bearings, and in the entire racing season no change was made in bearings, and no trouble was had from any mechanical cause.

Yours truly

*Louis A. Disbrow*

L.A.D.

**FEDERAL  
RUBBER CO.**

Milwaukee, Wis.

biles. Peder M. Knutson, Clifford, N. D., assignor of one-half to Henry Kram, Clifford, N. D. Filed March 12, 1909. Serial No. 482,976.

1. The combination with a vehicle body, of a frame supporting said body, wheels mounted on axles at the front and rear of said frame, runners attached to the front wheels, runners secured to the rear axle, plates arranged on either side of the rear wheels, one of said plates being obliquely disposed beyond the periphery of the wheel, blades extending outwardly at right angles to the oblique portions of said plates and secured thereto, and means for securing said plates together, substantially as and for the purpose set forth.

942,217. Mechanism for Vehicle Lamps or Headlights. Alois P. Prendergast, Baltimore, Md. Filed May 15, 1907. Serial No. 373,747.

1. In an automobile or similar vehicle, a steering rod, a gear connected thereto and constituting part of the mechanism for steering the vehicle, a lamp, a rotatable up-right on which said lamp is mounted, an arm fixed to said upright, a second gear connected to said steering rod, a crank arm secured thereto, and connections between said arms whereby said lamp is moved concurrently with the angular movement of the wheels.

942,232. Valve for Automobile Drip Pans. Thomas A. Yapp, Buffalo, N. Y., assignor to E. R. Thomas Motor Company, Buffalo, N. Y., a Corporation of New York. Filed May 24, 1909. Serial No. 497,960.

1. A valve for the drain openings of automobile drip pans comprising a valve ring adapted to be secured to the underside of said pan around its drain opening, a guide bar secured to the upper side of said pan across said opening, a valve disc movable toward and from the underside of said ring, a valve stem connected at its lower end with the disc and guided with its central part in said bar, a head arranged on the upper end of said stem and a spring interposed between said bar and head and operating to hold the disc yieldingly in its closed position.

## LASCO FOLDING GLASS FRONT

Simple, effective, correctly designed mahogany finish wood frame—trimmed in brass—3-16 crystal plates—steel stay rods—bottom of frame shaped to dash of any standard automobile—can be attached easily and quickly. We make the London Tops. Write for details and prices.

### NO INJUNCTION AGAINST E-M-F.

**Judge Swan Terminates the Matter by Denying the Studebaker Petition—Result Relieves Some Uneasiness.**

Refusing to grant the injunction against the E-M-F. Co., of Detroit, Mich., which the Studebaker interests have sought, Judge Swan, in the United States Circuit Court at Detroit, dismissed the Studebaker petition yesterday (Wednesday), his action resulting in an entire clearing away of the clouds of injunction possibility which have been floating over the controversy between the contending sides. Although the likelihood that an injunction would be granted in the circumstances was not seriously considered in some quarters, the actual court decision is of a kind greatly to relieve dealers and others who have been somewhat apprehensive as to whether the E-M-F Co. was in danger of not being able to carry out the program which was adopted by it after the split.

Judge Swan's decision was made after a hearing on the 25th ult., when a whole day was taken by the attorneys for the Studebaker Automobile Co., of South Bend, Ind., and the E-M-F Co., respectively, in rehashing the conflicting versions of the misunderstanding that arose under the arrangement by which the Studebaker company served as the distributing channel for E-M-F. cars. Subsequent to the hearing Judge Swan had given the attorneys three days in which to file briefs, after which he took the case under advisement.

Following the rupture, the Studebaker company applied to Judge Swan's court for an injunction, and a temporary restraining order was in effect for three days, but the application for a permanent injunction was withdrawn in the latter part of December. The Studebakers went to Cincinnati, in another Federal Court circuit, and applied for an injunction, but this was denied. The Cincinnati judge in effect re-

ferred them back to Detroit, to the court of original jurisdiction, and Judge Swan's decision just rendered is the termination of the renewed efforts made by the Studebakers in that court.

### Ford Buys Control of Keim Mills.

Henry Ford and his associate stockholders, acting as individuals and not as the Ford Motor Co., of Detroit, Mich., have purchased a controlling interest in the John R. Keim Mills, Inc., of Buffalo, N. Y., which for the past two years has been producing many of the pressed steel parts used in the Ford cars. The step is indicated as having been taken to protect and assure a positive source of supply for the Ford company. John R. Lee will continue as president of the concern and the general character of the production, which includes a considerable volume of cycle parts and specialties for other industries, will not be altered at present, though it has been decided to increase the factory force to 1,000 men. Norval A. Hawkins, of the Ford Co., has been made vice-president.

### Law Leaves Columbia to Move West.

F. A. Law, superintendent and chief designer of the Columbia Motor Car Co., of Hartford, Conn., has resigned and will sever his connection with the company on the 19th inst. He expects to leave Hartford about the first of March to become factory manager for one of the plants of the General Motors Co. in the Middle West. His partner, F. T. Reid, in the F. A. Law Machine Co., of Hartford, will continue that business as in the past.

### Whitlock Ties to Wetzel and Peterson.

The Whitlock Coil Pipe Co., of Hartford, Conn., has made arrangements by which T. J. Wetzel, of New York City, and K. Franklin Peterson, of Chicago, will act as direct factory representatives in the sale of Whitlock radiators, manifolds, piping and other products for the automobile manufacturers. L. D. Bolton, under the direction of Peterson, will look after the Whitlock interests in Detroit.

### A. M. C. M. A. BREATHES ITS LAST

**Meets the End Surrounded by Its Friends—Deceased Left an Estate of Over \$60,000 for Division.**

Chicago, Ill., Feb. 9.—The American Motor Car Manufacturers Association, aged five years, expired here yesterday in the New Southern Hotel. It drew its last breath at about noontime. Expiration by limitation is given as the technical cause of demise, but all save the attending physicians are well aware that a strong contributing factor was the lump of Selden patent butter which first lodged in the association's throat several months since. Unlike other brands of butter, the Selden lump not only refused to melt, but expanded to such proportions that the patient slowly choked to death. Its end was comparatively painless and far from melancholy. It was conscious to the very last and passed away with a smile on its countenance and a good word for its nurses and for the management of the Chicago show.

The estate of the deceased amounts to more than \$60,000, which by the terms of its will, will be divided among its 45 heirs. The division will be made on a pro rata basis in accordance with the amounts paid into the treasury by the heirs or members, a committee on liquidation being appointed to perform this last and rather cheerful rite. By the terms of the will H. O. Smith, chairman of the board of management, received a gold watch in token of his services and sums were set aside for the purchase of tokens of similar nature for Job E. Hedges, the association's counsel, and for Alfred Pierpont Reeves, its former general manager, who began nursing the infant when it was very young and so very tender that he advanced its first month's rent and who tended it until that lump of Selden butter swelled to such alarming proportions. After consulting a number of the other nurses, Reeves then assumed

charge of the Selden creamery, into which not a few of them already had wandered and in which more of them since have taken up their abode. There are still others who are anxious to do likewise and it was because of this state of affairs that there was small need for a mourners' bench at yesterday's death watch. According to the reports of those who were in at the death, the gathering was a large one. No tears were shed. Everyone was in a cheerful frame of mind and all transactions were unanimous.

The American Motor Car Manufacturers Association was born in Chicago in 1905. It was born chiefly to combat the Selden germ or patent. Apparently it was believed that five years would be sufficient to attain that purpose, as the articles of agreement or association limited the life of the association to five years, which period expired this year. Of course, the articles might have been renewed, but meanwhile the Selden germ has attained such strength and lodged so thoroughly in the association's system, that renewal was not even suggested. If any other organization arises to take its place, of which there is but remote likelihood, it must be an entirely different association, as the A. M. C. M. A. is leader than Hector and beyond recall; and with it dies the "Independent" show held annually in Grand Central Palace, New York.

After final reports had been rendered at yesterday's meeting, and speeches had been made and the various bequests provided for, the association expired with a resolution on its lips expressing "high appreciation of the management of the Chicago show and its completeness and artistic and practical features."

#### Connecticut Cab Succeeds W. C. P.

The Connecticut Cab Co., capitalized at \$50,000, has been organized in Bristol, Conn., to operate taximeter cabs in New York City, succeeding to the business of the W. C. P. Taxicab Co., of which it is to an extent a reorganization. The officers of the new company are Albert F. Rockwell, president; Ernest R. Burwell, vice-president; Charles Terry Treadway, treasurer; Ira Newcomb, assistant treasurer; L. T. Holdsworth, secretary and general manager. The W. C. P. Taxicab Co. has been operating about 100 "yellow taxicabs" of New Departure manufacture in the Metropolis.

#### Four More Get Selden License.

With the addition of four more names announced by the Association of Licensed Automobile Manufacturers on the 5th inst., the list of concerns licensed under the Selden patent reaches 71. The new names include the Grabowsky Power Wagon Co., Detroit, Mich.; Reliance Motor Truck Co., Owosso, Mich.; Oakland Motor Car Co., Pontiac, Mich.; and the Randolph Motor Car Co., of Chicago, Ill., manufacturing commercial cars.

## "OBJECTIONABLES" DARE NOT BUY

Accessory Maker's Attitude Supported by Court—Willis Loses Motion to Have Klaxon Injunction Modified.

That an accessory manufacturer will be sustained in the courts in keeping his goods from being sold on any terms whatever to concerns that are objectionable to him, either because of price cutting or for other reasons, provided that the goods are put out under a patent license which forbids their sale to any one designated by the manufacturer as objectionable, again has been demonstrated in the results attending an effort on the part of the E. J. Willis Co., of New York City, to obtain a modification of the injunction which last December was entered against it in relation to Klaxon horns. The Willis motion came before United States District Judge Learned Hand in New York City, and the modification asked for was an alteration in the original injunction which would permit the Willis company to buy Klaxon horns from licensed dealers provided the company bought them and sold them after full observance of all the conditions of the licenses. Judge Hand denied the motion.

Although the selling of motor car accessories with patent license tags attached stipulating either the price or the conditions which must be observed is becoming quite common, the Lovell-McConnell Mfg. Co., of Newark, N. J., which makes the Klaxon horn, has gone further, and among the several rigid provisions of its license is one which states that dealers "may not sell to anyone designated by the makers as objectionable." The Willis company, having been brought to book for not only cutting price but for violating several other provisions of the license under which each horn is put out, was enjoined by the Lovell-McConnell company from handling Klaxon horns at all, being placed distinctly in the "objectionable" class.

When the motion for the modification of the injunction came up for argument, the Lovell-McConnell attorney opposed it on the ground that it would be impossible for the Willis company to buy any Klaxon horns so long as it was designated by Lovell-McConnell as objectionable, because by the terms of the licenses the license for use or sale terminates as soon as the horn is sold to an objectionable person or company. From which it was argued that the Willis company, knowing itself to be objectionable to the manufacturer, never could get a valid license for use and re-sale.

#### Buick Pays the Wetherill Bill.

By furnishing a bond of \$102,000, the Buick Motor Co., of Flint, Mich., released the garnishments on its funds in Detroit banks, incident to the legal proceedings in-

stituted by the Wetherill Finished Castings Co., of Philadelphia, Pa., to make the Buick company pay up \$100,000 for which the Wetherill company no longer cared to wait. The account, which was some four months overdue, was paid in full by the Buick company subsequent to the filing of the bond, the latter remaining in effect until the Buick check should go through and be paid by the bank against which it was drawn.

The filing of the bond relieved the Buick company from having to disclose how much money it had in the four banks on which the writs of garnishment were served, although it is intimated that the company, which is one of the mainstays of the General Motors "trust" project, had been gathering a heavy accumulation of funds for a big "deal." Following the Wetherill suit, however, old accounts against the Buick company to the extent of more than a million dollars have been paid to waiting creditors, with an effect on the Buick accumulation not difficult of mathematical calculation.

#### Van Dykes to Have Fixed Maintenance.

The Van Dyke Motor Car Co., of Detroit, Mich., which exhibited a delivery wagon at the Detroit show, has announced plans for a factory consisting of three buildings, 704 by 60 feet, which is to be ready by next April. The concern's destinies are under the control of Frank G. Van Dyke, president; George P. Davis, designer, and George a Troutt, general sales and factory manager. The product is to be a friction drive, two cylinder opposed motor type, of 1,000 pounds capacity, and it is intended to establish service stations in various cities where \$30 per month will be charged for the guaranteed maintenance, including fuel, lubrication, washing and adjustment.

#### Trego Joins the Hudson Forces.

Frank H. Trego has been appointed to a post in the technical department of the Hudson Motor Car Co., of Detroit, Mich., and, in consequence, has resigned as secretary of the Chicago Motor Club in order to go to Detroit. Harry T. Clinton, who has been treasurer of the club, has resigned that office to take up the secretary's work, while the office of treasurer has been filled by the election of Frank H. Martin.

#### Harding with American Locomotive.

Hugh N. Harding, widely known as a racing driver, has joined the forces of the American Locomotive Co., at Providence, R. I., in a technical capacity. He will be engaged in experimental and testing work, under the direction of B. L. Gray, chief engineer of the plant.

#### Hood is Chalmers Sales Manager.

Wallace C. Hood has been made sales manager of the Chalmers Motor Co., of Detroit, Mich. He has been acting as a special travelling representative of the company for some time.

## BENOUNCE DISGUISES OF ORIGIN

**Car Buyers Suspect "British Built" Bedford's Alien Source—Why "Center" Should Have Been Spelled "Centre."**

No little agitation and feeling has been generated in England by a controversy over whether or not false representations have been made concerning the proportions of American and British manufacture embodied in the Bedford car, which is offered for sale in England by a relative of the General Motors Co., and which very much resembles the Buick in many respects. A strong sentiment exists for "British built" cars, to correspond with the loyalty which Englishmen are called upon to exercise in regard to all goods of British manufacture as against importations, and it is alleged that although the representatives of Bedford Motors, Ltd., the London subsidiary of General Motors, have indicated that the Bedford is "British built," there are reasons for supposing that no small part of it is built in the United States.

One prospective customer was struck with the fact that a timing mark on the fly wheel read "Center" instead of being spelled "Centre," which latter is the English orthographical rendering of the word, while an indignant correspondent took the Autocar, one of London's foremost automobile papers, to task for referring to the car as being British built and stated his reasons for believing that it is "in reality the Buick car." The Autocar dutifully sent a copy of the letter to Bedford Motors and after a reasonable time explained to its readers "they did not reply, and so far as we know, they never have replied, as no rejoinder from them upon the subject has reached us or it would have been published."

"We have nothing to say against the Bedford car if, or because, it is made in America," the Autocar continues, "but we protest very strongly against any car be claimed to be British if it be not made in Great Britain."

### Fickling in Receiver's Hands.

Bankruptcy proceedings have been brought against Fickling & Co., of New York City, manufacturers of automobile tops, bodies and equipment, Judge Adams appointing William Henkel, Jr., as receiver. The liabilities are estimated at \$18,000, of which \$9,000 is unsecured, and the business assets at \$29,000, consisting of plant, \$20,000; accounts, \$4,000, and good will \$5,000. The petition alleges that the corporation is insolvent and that it transferred all its outstanding accounts to the Northern Bank of New York. It also is alleged that the bank has taken possession of the assets on a chattel mortgage of \$8,500, has closed up the stock room and has prevented the taking of materials for

## THE MOTOR WORLD

the factory to complete contracts amounting to \$6,000. Judge Adams issued a restraining order against the bank from interfering with the possession of the receiver, as the bank had posted notices of the sale under the chattel mortgage and W. I. Fickling, the president of the concern, stated that the company would suffer irreparable loss if the sale took place.

### York Effects Its Change of Name.

In accordance with its intention previously announced, the York Motor Car Co., of York, Pa., has changed its name and hereafter it will be known as the Pullman Motor Car Co., Inc. The application having been granted by the courts, the change went into effect on February 1, but the officers and personnel of the company are the same as before. As the company makes the Pullman automobile and is shortly to operate a plant in Evansville, Ind., as well as in York, the new name was decided upon.

### Couple-Gear for Pleasure Cars.

The Church Balance Gear Co., of Grand Rapids, Mich., which formerly was known as the Holson Motor Patents Co., and which owns the patents under which the Couple-Gear Freight Wheel Co.'s electric trucks are built, is preparing for the promotion of a company of large capital to build pleasure cars on the same system. The annual election of officers has resulted as follows: Melvin B. Church, president; Charles D. Sharrow, vice-president; F. J. Church, second vice-president; M. Clay Church, secretary and treasurer.

### Mezger Wins Infringement Decree.

Infringement prosecution brought by the C. A. Mezger Co., of New York City, against the Pioneer Auto Top and Supply Co. of Kansas City, Mo., has resulted in the entering of a consent decree in the Federal Court in Kansas City, granting an injunction against the defendant concern and preventing it from continuing the manufacture of wind shields of a form covered by the Mezger patents. The Pioneer company admitted the infringement and agreed that judgment be entered against it.

### Ricketts Becomes the Diamond.

Succeeding to the business of the Ricketts Auto Works, of South Bend, Ind., a new company has been formed with \$50,000 capital, known as the Diamond Automobile Co., and the car, which was introduced as the Ricketts Six is now styled the R. A. C. The Paul Picard Co., of Chicago, Ill., is distributor for the West.

### Flint Top Takes a Factory.

The Flint Auto Top Co., recently incorporated in Flint, Mich., with \$10,000 capital, has elected the following officers: M. L. Dyer, president; S. D. Bolton, vice-president; C. A. Fox, secretary and treasurer, and A. W. Myers, superintendent. The company has taken a factory on Mill street.

## DAIMLER SALE YIELDS JUST \$1

**Mysterious Bidder Secures Control Without Difficulty or Serious Cash Investment—Acquires a Block of Patents.**

For the moderate sum of \$50 a man not known to the automobile trade purchased yesterday (Wednesday) not only a \$200,000 suit against the Daimler Motoren-Gesellschaft, of Cannstatt, Germany, and a contract having a "minimum face value of \$62,500," but also some 37 American patents relating to motor cars, numerous assigned applications, a trade mark, and a dozen Canadian patents, together with the majority stock and control of the Daimler Manufacturing Co., of New York City, which at one time made the American Mercedes car at Long Island City. For \$50 more he obtained 1,341 shares of the preferred stock of the company, having a face value of \$100 each.

The sale was at auction and took place at noon in the busy Exchange Salesroom on Vesey street, New York, sandwiched in with the general pandemonium incident to the auctioning off of all kinds of securities, insecurities, real estate, bonds, mortgages and commercial what-nots by a dozen bawling auctioneers lining the sides of the large room. In the group of possible bidders who gathered in front of the stand where the Daimler parcel was disposed of there were to be seen no familiar faces of the automobile trade, aside from that of a more or less mysterious personage whose favorite role is detective for the industry and whose purpose, as he explained to the Motor World representative, was not to buy but merely to see who the purchaser was to be.

The one bidder, whose two \$50 investments brought him so much, gave his name as R. Waldo McKeon, but he did not indicate whether the purchase was made for himself or for a principal of whom he was but the agent. His opportunity for purchase came as a result of the sale ordered by Lawrence E. Sexton, trustee in bankruptcy of Kessler & Co., formerly bankers at 54 Wall street, New York. The offerings, which were described at some length in the Motor World three weeks ago, consisted of "all debts, dues, claims and demands of the trustee against Daimler Mfg. Co., amounting to upwards of \$30,000; together with 2,401 3-5 shares of stock of Daimler company (common); also 66 9-10 shares preferred held as collateral against \$6,690 of above indebtedness, and 10 shares old stock of said company; also possession of certain books, records, patterns, etc." The foregoing were sold as one entire lot, while the 1,341 shares of preferred Daimler stock (collateral shares repledged) constituted the second lot. The assets of the Daimler company consists of the "very valu-

## THE MOTOR WORLD

able contracts, United States letters patent, claims for damages for breaches of contract, and for infringement of said letters patent, and other property," as set forth by the Kessler trustee and which the Motor World presented in some detail.

As yet there are no indications as to what the purchase may mean in relation to the business being resumed. The shop and land of the company in Long Island City were foreclosed and sold some time ago, and whether the concern is to be revived either as an active manufacturing element or as a factor in the patent field has not yet been determined.

### Chalmers Gives Foremen His Views.

While dinners and "love feasts" for the sales departments of the different automobile manufacturing companies are of frequent occurrence, it is not often that the production end of the business participates in such affairs, so that for this reason, as well as for the fact that Hugh Chalmers, president of the Chalmers Motor Co., of Detroit, Mich., made it the occasion for expressing some original views of the automobile business, the dinner tendered by that company to 22 foremen and inspectors of the production departments on the 3d inst., was quite out of the ordinary. In the morning H. L. Bill, assistant superintendent, spoke to each of the men, telling them to report in the office at 6 p. m. for a lecture from General Superintendent Reddig and to send word to their families that they might be kept late. When they assembled they were led to waiting automobiles and carried to Dobson's road house, Grosse Pointe, where the dinner was served, as a complete surprise.

Having been called out of the city, Hugh Chalmers himself could not attend, but a letter from him was read. After thanking the men for their support and for creating a record month of production, he touched on the future of both the Chalmers company and the industry as a whole.

"I believe the future is absolutely assured for most of the standard makes of automobiles," he said, "because the motor car more than anything else has been the greatest advancement in transportation in more than a century. Then again the motor car is replacing the only thing that has been the same throughout centuries of civilization, and that is the horse. So it seems to me that the automobile is here to stay as long as the horse has been with us. That being the case, none of us need fear much about the future of the business during our lives."

### Duff to Make Carburettors.

Nebraska City, Neb., is the home of a new company organized with \$25,000 cash capital to manufacture carburettors and automobile parts and which is styled the R. A. Duff Engineering Co. The incorporators include R. A. Duff, Harry Holfe and Clarence Armstrong.

### THE WEEK'S INCORPORATIONS.

Detroit, Mich.—Lozier Motor Co., under Michigan laws, with \$10,000 capital.

Detroit, Mich.—Motor Appliance Co., under Michigan laws, with \$25,000 capital.

Battle Creek, Mich.—Ideal Auto Lighter Co., under Michigan laws, with \$10,000 capital.

Kansas City, Mo.—Standard Motor Sales Co., under Missouri laws, with \$7,000 capital.

Cleveland, O.—Cleveland E-M-F. Co., The, under Ohio laws, with \$20,000 capital.

Philadelphia, Pa.—Boulevard Garage Co., under Pennsylvania laws, with \$10,000 capital.

Hamilton, Ont.—Tire & Rubber Goods Co., The, under Ontario laws, with \$40,000 capital.

Milwaukee, Wis.—Garage Equipment Mfg. Co., under Wisconsin laws, with \$100,000 capital.

Toronto, Ont.—Ontario Motor Supply Co., Limited, The, under Ontario laws, with \$40,000 capital.

Morgantown, W. Va.—Central Auto Co., under West Virginia laws, with \$10,000 capital; general automobile business.

Milwaukee, Wis.—Abresch-Cramer Auto Truck Co., under Wisconsin laws, with \$20,000 capital; to manufacture commercial vehicles.

Bay City, Mich.—Oswald Auto Co., under Michigan laws, with \$6,000 capital. Corporators—Margaret Oswald, P. J., J. G. and W. A. Harrison.

Los Angeles, Cal.—Henry & Brown Motor Co., under California laws, with \$12,000 capital. Corporators—W. E. Henry, W. C. Henry and Herbert Brown.

Kansas City, Mo.—Southwest Motor Car Co., under Missouri laws, with \$25,000 capital. Corporators—W. S. Hathaway, G. W. Jones and A. E. Hathaway.

Cleveland, O.—Gabriel Auto Co., The, under Ohio laws, with \$10,000 capital. Corporators—C. W. Gabriel, W. L. Saper, H. E. Gabriel, W. J. Marks and A. W. Gasser.

New York, N. Y.—Gleason Taxicab Co., The, under New York laws, with \$25,000 capital; to operate taxicabs. Corporators—C. H. O'Neil, T. E. Costello and J. F. Whiteley.

Toledo, O.—McNaull Auto Tire Co., The, under Ohio laws, with \$50,000 capital. Corporators—W. D. McNaull, F. W. Caughling, Edgar C. Hampton, F. E. Miller and P. F. Parrott.

Boston, Mass.—Manhattan Motor Truck Co., The, under Massachusetts laws, with \$10,000 capital. Corporators—Alphonso E. Kenney, William H. Britton and Philip Dooskin.

Indianapolis, Ind.—Indianapolis Auto Top & Rubber Co., The, under Indiana laws with \$15,000 capital; manufacturers. Cor-

porators—F. L. Palmer, A. K. Ziegler and E. E. Wilkee.

Chicago, Ill.—K. & S. Garage Co., under Illinois laws, with \$3,000 capital; general garage and livery business. Corporators—John Koelling, Charles K. Samuels and Theobald Mueller.

Morristown, N. J.—Eastern Krit Sales Co., under New Jersey laws, with \$100,000 capital; to deal in motor vehicles. Corporators—Victor A. Wiss, Thos. A. Wiss and William A. Hurtzig.

Indianapolis, Ind.—Delmar Auto Body & Wheel Co., under Indiana laws, with \$1,000,000 capital; to manufacture automobile bodies and wheels. Corporators—E. H. Habig, E. E. Weir and others.

Grand Meadow, Minn.—Nolan Auto Co., under Minnesota laws, with \$50,000 capital; general automobile business. Corporators—W. A. Nolan, W. R. Zabel; G. T. Torgimson and G. A. Wright.

Chicago, Ill.—De Luxe Motor Service Co., under Illinois laws, with \$2,000 capital; general automobile livery and garage. Corporators—Homer R. Mallow, Chauncey C. Macklin and Deo R. Parsons.

New York, N. Y.—New Taxicab & Auto Co., under New York laws, with \$25,000 capital; to manufacture, deal in and repair motor vehicles. Corporators—G. H. Reaney, F. J. Manning and M. W. Cooper.

Chicago, Ill.—Central Sales Co., under Illinois laws, with \$2,500 capital; to manufacture and deal in motor vehicles, machinery, etc. Corporators—Ingvall N. Herreid, William R. Wiley and Robert E. Hagon.

Middletown, N. Y.—Central Garage Co., The, under New York laws, with \$10,000 capital; to deal in automobiles, motorcycles, etc. Corporators—William L. Mitchell, Edwin P. Valkenburgh and Howard D. Rockafellow.

New York, N. Y.—Yorkville Automobile & Garage Co., The, under New York laws, with \$3,000 capital; to manufacture and deal in automobiles, engines, etc. Corporators—Adolph Miller, Phillips Freed, Armin H. Mittlemann.

Camden, N. J.—Louis J. Bergdoll Motor Co., under New Jersey laws, with \$500,000 capital; to manufacture and deal in motor vehicles. Corporators—Louis J. Bergdoll, Philadelphia; F. R. Hansell and John A. MacPeak, Camden.

New York, N. Y.—Monaton Motor Car Co. under New York laws, with \$100,000 capital; to deal in automobiles and supplies, and operate garages. Corporators—M. McKenna, Brooklyn; W. J. Markell and W. M. Scott, New York City.

St. Louis, Mo.—Smith Automobile & Battery Co., under Missouri laws, with \$10,000 capital; general automobile business. Corporators—Arthur King, Fred G. Smith, Adolph Zuerst, Jr., and Herman Wieland, St. Louis; Benson D. Smith, Hillsboro, Tex.

## IN THE RETAIL WORLD.

E. O. Babcock, Unionville, Mich., sees a future in the automobile business and will open a garage this spring.

Cordes Bros., Henning, N. D., are preparing to erect a garage; it will be of brick construction, two stories.

E. T. Wiggins, Inglewood, Cal., is having plans drawn for a new garage; it will be located on Commercial street.

Charles M. Noble, Newton Highlands, Mass., is building a garage; it is located near the Stevens building on Walnut street.

Myers & Tetrick, Blackwell, Okla., have embarked in the automobile business and will handle the Overland. They will open a garage soon.

John J. Corkery, Yonkers, N. Y., has been granted a permit to erect a garage at 217-219 Riverdale avenue. It will be a brick building, two stories high.

Samuel E. Stokes, Philadelphia, Pa., has let the contract for a garage in the rear of 4519 Wayne avenue. Its dimensions are 46x33 feet, and it will cost \$2,300.

The Springfield (Ill.) Motor Car Co., has established a Chicago agency at 1549 Michigan avenue. Nelson Gotshall, sales manager of the company, is in charge.

John F. Welch, Blackwell, Okla., who recently disposed of his interest in the Rice & Welch garage, has established a garage at Newkirk. He will handle the Ford.

F. A. Brandle, Northampton, Mass., has leased the old electric lighting station near Masonic street, and will remove his garage business there. He now is located on State street.

Fire destroyed the garage of E. P. Rowe in the rear of the Tuttle House, Dorchester, Mass., last week. Three machines were burned, the cause of the fire being unknown.

H. Rozell, New York City, has leased from M. J. Kelly, the two story stable building at 207 West Seventy-fifth street, and when alterations are completed will occupy it as a garage.

The Arnold Motor Co., Omaha, Neb., has taken possession of its new garage on South Lawrence street. The new establishment is conveniently located and is well equipped.

F. E. Glenn, Tulsa, Okla., is having built a garage at 409-411 East Third street. It will be of brick, one story, 60x150 feet, and will cost \$6,000. It will be ready for occupancy in the spring.

The Idelbach Automobile Works, Houston, Tex., has begun business in that place and is located on Rusk street. The establishment will be devoted to rebuilding and repairing exclusively.

The Eastern Krit Sales Co., Morristown, N. J., has opened sales rooms at 10½ Pine street and will act as local representatives for the Krit cars. Victor A. Wiss, Thomas

A. Wiss and William A. Hurtzig constitute the firm.

The Union Auto & Sales Co., Omaha, Neb., is another concern which has a garage under way on North Lawrence street. When completed it will be the home of the Haynes, Parry and Krit cars.

The H. B. Doherty Co., Binghamton, N. Y., has been taken over by the Utica Motor Car Co., of that city, and hereafter will be known as the Binghamton company. The former proprietor will continue with the new firm.

W. V. B. Campbell, of Milwaukee, has entered the automobile business in Minneapolis, Minn., and has taken quarters in the Parker garage at Tenth street and Mary place. He will handle the Lozier, which is new to the Flour City.

The Hokanson Automobile Co., Madison, Wis., celebrated the opening of its new garage last week with a housewarming. The building is 90x135 feet, three stories and has storage room for 200 cars. Both White lines are handled.

G. P. Hewitt, Milwaukee, Wis., has opened temporary quarters at 176 Thirteenth street, near Grand avenue, where the Buick line will be handled. A new building which will be a local branch will be erected in the spring.

The Snow automobile Co., Des Moines, Iowa, has taken possession of its new garage at 121-123 South Main street. The establishment is well appointed throughout and includes a repair shop. Rambler and Overland cars are handled.

The Commercial Motor Car Co., Denver, Col., is the latest addition to the local automobile colony, with salesrooms at 1627 Champa street. They represent the Buffalo commercial cars and later will take on a line of pleasure vehicles.

The Fawkes Automobile Co., Minneapolis, Minn., has purchased, presumably for garage purposes, a plot 100x150 feet, fronting on Hennepin avenue between Harmon place and Maple street. The price paid, \$30,000, is a record for the district.

The Twin City Taxicab Co., Minneapolis, Minn., has been formed in that city to operate a taxicab service, and has its headquarters in the new Parker garage. They start with a fleet of fifteen machines, which number will be doubled next month.

The McIntyre Automobile Co., Omaha, Neb., expects to take possession of its new garage at 2203 Farnam street, about the middle of this month. They have added to their line of cars which now consists of the Welch, Oakland, Staver and Gleason.

H. C. Whittaker, Wheeling, W. Va., one of the prominent business men of that city, has dipped into the automobile business, and has taken on the Rainier. His territory will consist of the northwestern section of West Virginia and southwestern Ohio.

The Standard Automobile Co., of Illinois, is the style of a new concern which has

opened up at 1326 Michigan avenue. They will act as distributors for the Cole "30" for northern Illinois and Indiana, and the entire states of Michigan and Wisconsin.

C. H. Palmer, Chicago representative of the Racine Boat Co., has added automobiles to his line and will represent the Abbott-Detroit and Krit cars in the Windy City. The newcomers will share quarters with the water vehicles at 1610 Michigan avenue.

For the second time within a month, A. V. Hart, Rochester, N. Y., has been visited by fire at his garage. The last visitation occurred at his South Water street establishment last week and did \$1,000 damage before it was extinguished. Incendiarism is suspected.

The Ford Motor Co., Houston, Tex., now is located in the Stersenberg building at the corner of Walker avenue and Milam street, occupying the entire ground floor. It will be a distributing base for Ford cars for the entire southern half of the Lone Star state.

The Bates-Odenbrett Auto Co., Milwaukee, Wis., has bought out the Browne Motor Car Co., and will take over the Marion and Overland lines, which were handled by the absorbed concern. The purchasing firm, which is the oldest in the city, is located at 503-507 Broadway.

E. W. Burns, Spencer, Mass., proprietor of the Massasoit House, is contemplating the erection of a garage to accommodate the great amount of automobile traffic which passes through the town. If a suitable site is decided on the structure will be erected in the spring.

The Utica (N. Y.) Motor Car Co., has established a branch in Schenectady, which will be known as the Schenectady-Cadillac company and will be in charge of E. G. Peterson. The company recently was allotted additional territory for Peerless and Cadillac cars which it handles.

Ford & Lyon, Fitchburg, Mass., have let the contract for an addition to their garage on Pritchard street. The new building, which is expected to be ready for occupancy March 15, will give a total of 25,000 square feet of floor space. The firm represent the Rambler and Maxwell cars.

The Curtis Automobile Co., Milwaukee, Wis., soon will let the contract for a two story brick and steel garage and sales room at 142-144 Eighth street, just south of Grand avenue. The building will be equipped with all modern appliances and is expected to be ready for occupancy by May 1.

Schulte & Dean, Scranton, Pa., are having plans drawn for a garage to be built on the Farr property on Adams avenue. Its dimensions will be 40x48, either two or three stories, the height being undetermined yet. The firm at present are located at Washington avenue and Ash street and handle the Rambler and Regal cars.

# **WHITE Steam and Gasoline CARS**

**Q**UANTITY is the fundamental requirement in constructing White steam and gasoline cars and no manufacturing methods which might endanger quality are permitted in the White factory.

The workmen are paid by the hour—not by the piece—so there is no incentive for them to devote less time and care to any operation than is its due. No over-time work is permitted, because work so done is generally not so painstaking as it should be. We do not employ a “night shift” because in this way responsibility is divided and work done by artificial light cannot be as good as that done by daylight. Finally nothing is rushed through the White factory.

Each operation is allotted the full time necessary to secure the highest standard of quality. For example, forty-two working days elapse between the time a body is received into the paint shop and the time it is sent to the assembling-room. Similarly, every other operation receives every care which our ten years’ experience in manufacturing high-grade automobiles can suggest.

#### Advantages of the Accelerator.

Words of commendation should be uttered for the benefit of such makers as are coming back to the use of foot accelerator pedals on their standard cars. For a number of years the use of this most important member of the controlling system has languished among those who have followed at all closely the dictates of foreign practice. Recently, however, its gradual adoption by one maker after another has been noticed, until now only a few are left who are out of line in this respect. Questions there may be as to the proper method of connecting the accelerator, of interconnecting it with the hand lever on the steering wheel, which generally is used interchangeably with it, and of contriving it so that it can be operated without fatigue on the part of the driver. But of its usefulness there is no longer any question.

It is more particularly in the ease of gear changing which it effects, and in the ability to accomplish sudden bursts of mod-

erately high speed, almost immediately relapsing into slow speed, that it becomes most advantageous. The latter attribute comes most handily into play when manipulating in close traffic, when to operate the lever on the steering wheel without in any wise jeopardizing the steering control is a work of functions not unattended with risk of disaster. Hence the accelerator pedal is found on nearly all town cars, as well as upon medium sized touring cars such as are used largely for town and general service.

Considering the two principal uses of the accelerator, it is important to call attention to one direction in which several makers are working, and in which they are encouraged by most reasonable theory. That is, in so arranging the connecting mechanism that the pedal is capable of accelerating the car to only about half speed, or thereabouts.

The advantage of this arrangement is that it obviates the possibility of racing the engine merely by depressing the pedal, incidentally preventing the straining of the motor in consequence of ignorant or injudicious handling. For gear shifting purposes, there is practically no need to run the engine at more than half speed, except when the car is traveling very fast, in which case a quick shift usually is made, often without altering the speed of the motor until after the higher gears are engaged. For traffic work also, there seldom is need for very high speed, though not infrequently the nervous driver is impelled to force the pedal into its extreme position merely through the momentary embarrassment of a tight squeeze.

It requires little mechanical skill to contrive the connections in such a way that the desired result can be brought about, and in fact in one or two instances noted at the shows this year, it appears to have been almost an accidental result of certain combinations in the design. It also entails small expense upon the maker. By the same token, it affords ample opportunity for favorable argument, and should prove a useful addition to the list of necessary, and necessarily harmless, talking points about a new model.

#### Losses in the Repair Department.

Most unhappy of all phases of the automobile business is the draining and heart-breaking losses which many repair departments are bringing upon their proprietors.

It is the one branch or department where remedy is most needed, because of the fact that as a whole it is far from profitable. In some cases the proprietors are well aware that their repair work is causing them serious loss, while in others the losses are taking place without being located definitely, a condition which is made possible when the repair department receipts and expenses are mixed in with and not differentiated from those of an agency business in cars or accessories.

One of the most prominent dealers in the Middle West was amazed to find at the end of a big year's business that he had come out practically even when he should have been about \$45,000 ahead, figuring the book profits on his extensive operations. Himself unable to unravel the mystery, he subsequently opened his books and files to an expert auditor, who after going into the matter fully, was able figuratively to put his finger directly on the trouble. The missing \$45,000 was the amount that had slipped away as pure loss in the maintaining of several large repair departments, the operation of which was costing a considerable percentage over the receipts.

As a matter of fact, if scientific and intelligent bookkeeping be applied to all of the repair departments which are maintained in connection with the business of selling cars, few of them would show anything but a loss, when all proper charges against them had been taken into account. The reasons for loss are numerous and varied, and the remedy does not necessarily reside in the raising of the general scale of prices for repair or replacement work.

High rent, due to having the repair department in the same building as the sales room, is to be considered, suggesting the saving that would be effected by having the repair work done where the rental would not exceed that of ordinary machine shops or factory space. Free adjustments and minor repairs which come under the head of "taking care of customers" could be greatly curtailed without harm in many instances, with an immense saving in labor and material cost. A most strict and able supervision of the workmen in the repair department is necessary, that their hours may be truly productive of results, and an imperative requirement is a vigilant and efficient guardianship of parts, materials, tools and supplies, which melt away with surprising rapidity if not constantly watched. The system of charges, too, is frequently ex-

ceedingly careless and haphazard, sometimes involving dishonest jugglery by which a protesting customer obtains a substantial reduction in his bill, and part of the amount deducted is "spread" over the bills of other customers. A repair department that is not depended upon as a "feeder" for garage business need never encounter the demands of chauffeurs' graft, but nevertheless, the "rebating" of chauffeurs exists almost as a regular practice in a few repair departments.

To be made successful or even self-sustaining from a financial standpoint, the repair department needs not only good book-keeping, which will show its affairs up clearly and accurately, but also good management, instead of being treated as a bothersome incidental which must more or less take care of itself. Each year as the business grows older, more customers are educated to an appreciation of good, honest repair work and to a willingness to pay for it. Likewise the proportion of demands for free repairs or replacements becomes less, in consequence of the greater durability and perfection of the cars that are sold and because the public has an increasing understanding of what is reasonable. All that remains is for the proprietors themselves to give keen business attention to matters which will prove costly if not handled in a way proportionate to their importance to the profit and loss account.

#### Motor Buggies and the Chicago Show.

Following the Motor World's recent editorial comment on the motor buggy as a "vanishing type" not a few expressions of opinion were heard which showed conclusively that in those quarters at least, the total disappearance of the type would be viewed with feelings of surprised disapproval. Nor is this attitude at all unexpected. Considered in its most favorable light, the motor buggy, which is confessedly an unhorsed carriage, engine propelled, is nothing more nor less than a compromise. As such it found and doubtless may continue to find for some time to come, a ready welcome among certain classes of buyers. It never was branded as a lost utility, nor as a type wholly out of date, but only as one engaged in the graceful act of disappearing from view. This view appears to be confirmed in some measure by the status of the Chicago show.

Not to judge too hastily in the matter, it should be admitted that the "private

## COMING EVENTS

February 5-12, Chicago, Ill.—National Association of Automobile Manufacturers' ninth annual show in Coliseum.

February 8-14, Los Angeles, Cal.—Automobile Dealers' Association of Southern California's show in Grand avenue rink.

February 14-19, Buffalo, N. Y.—Automobile Club of Buffalo's eighth annual show in Convention Hall.

February 14-19, Hartford, Conn.—Hartford Automobile Dealers Association's third annual show in Foot Guard Armory.

February 14-19, St. Louis, Mo.—St. Louis Automobile Dealers Association's annual show in First Regiment Armory.

February 14-19, Rochester, N. Y.—Rochester Automobile Dealers' Associa-

tion's third annual show in Convention Hall.

February 15-17, Washington, D. C.—American Automobile Association's national legislative convention.

February 17-19, Grand Rapids, Mich.—Grand Rapids Automobile Club's first annual show.

February 18-22, Fargo, N. D.—Fargo Automobile Dealers first annual show.

February 19-26, Los Angeles, Cal.—Licensed Association of Los Angeles' first annual show in Hamburger building.

February 19-26, Minneapolis, Minn.—Minneapolis Automobile Show Association's exhibition in National Guard Armory.

February 19-26, Newark, N. J.—Associated Automobile Clubs of New Jersey's show in Essex Armory.

February 19-26, Salt Lake City, Utah—Automobile show in Auditorium.

show" aggregation encamped in the vicinity of the Coliseum and up and down the length of Michigan avenue, is larger this year in probability than ever it was before; and that in the list of machines so revealed to the public there may be several worthy examples of the type in question. Judged solely on the basis of last year's show and that of the year before, however, it must be admitted that the motor buggy is fast declining and verging toward a state of complete and final dissolution. Just how long the absolute end may be deferred, however, is entirely another matter.

Despite the fact that at the show no maker appeared with an example of the true high wheeled carriage, several are exhibiting machines equipped with solid tires and fairly large wheels. Furthermore, such of the old motor buggy builders who still produce the type continue steadfast in their faith in it as a selling medium—among a limited class of customers.

To a Motor World man, one of the makers who still are producing motor buggies in limited quantities, defined this class as being composed of those who, through exaggerated ideas of the liability to punctures and blowouts are, as he put it, "afraid" of the pneumatic tire. Such owners, many of them enjoying the questionable advantages of a geographical location remote from the blessings of good roads, are in a position to enjoy to the full the advantage which the high wheels possess of being able to go most anywhere most any time. At the same time, however, and by the ready admission of the same indi-

vidual, comes the statement that many motorists of this class later become converts to the pneumatic, and are ready and willing to abandon the old love for the new, even before it becomes useless.

Indeed, it is for the benefit of such owners, among other things, that the formerly exclusive producer of high wheeled machines, so frequently may be found turning his attention to the smaller sized pneumatic; for that, and because, as he puts it, the demand for the standard type of car is far greater than that for the buggy type. Even so, the conviction is strong in many breasts that the utility of the motor buggy is bound to continue in a healthy state for a long time to come. And well it may. For its strongest point is that it is non-competitive with a majority of machines of other types now on the market, and that it serves to educate the reluctant and prejudiced to a newer and better appreciation of the more solidly constructed machine.

So long as bad roads continue to isolate people in remote sections of the country, it is probable that a few makers of really good machines of the sort will find purchasers for their outputs. But the number produced and sold each year must, in all probability, continue to diminish until a period when the peculiar conditions, theoretical and practical, which brought it forth shall have passed. At present the decline in its market is very strongly evidenced by its abandonment by a number of those who have been among its strongest advocates in the past.

# CARS THICKER THAN "FOREST"

Eight Real Trees Do Their Best to Spread Over the Immense Array of Motor Car Offerings at Chicago—Brick Walls, Verdure and Flowers Lend "Country Estate" Effects, but the "Woodsy Smell" Fails of Its Perfume—Display Impressive in Its Magnitude.

Chicago, February 8.—Whoever was responsible for the statement that the Chicago show would be held in a forest, that is, in a forest setting, either is a mighty poor guesser or he has a queer idea of forests. There never was a time when a forest was constituted of eight great big trees under the spreading branches of which stand three or four times as many very much smaller trees, nor is it customary to find picket fences, stone gateways, flowering urns and gilded Doric domes within the confines of even a modest copse, and it is this sort of thing that is to be found in the Coliseum. It is not a forest at all.

It is more suggestive of an English gentleman's estate, or several English gentlemen's estates, whose front yards adjoin, which was the description vouchsafed by those who are not so keen on forests as the make believe Pinchots and Ballingers. These foresters made it appear also that it might be possible to write down or write up this show with the smell. They said that a woodsy odor would pervade the atmosphere, but any one who came with nostrils dilated and lungs ready to inhale such an odor was sorely disappointed. The woodsy smell was left behind when the woodsman's axe felled the eight great trees in that "German" forest located in Willamette, Illinois.

But a smell is here all right, and it is a pleasant smell, too. It suggests the demonstration of a new cologne or sachette powder at a department store. Whoever works the invisible atomizer is on the job intermittently, which is to say that the odor is

not constant and pervades only portions of the big building. It is necessary to be on the right spot at the right time or the show goer will get no smell for his money. But the odor, as stated, is a pleasing one, and if the maker of the perfume does not experience a stimulation of business it is his own fault, nor is he to blame if the odor is unsuggestive of gasoline.

If what has been said appears to be airy persiflage or to be in any way a reflection on the show, let such thoughts be dismissed; for as a matter of fact, this Chicago show is far and away the most picturesque exhibition that ever has been staged. There never was anything in the same class with it.

But with no desire to be hypercritical, it is fair to say that the decorative scheme while striking and intensely original, is too theatrical for its purpose. It absolutely dwarfs, if it does not detract from, the exhibits, nor is it easy for description to do it justice and so obtrusive and overshadowing are those greens that make photographers ejaculate "nawsty" words, that it is doubtful if even the camera properly can serve its purpose.

There are four center sections in the Coliseum, each of which may be said to comprise an estate, and each estate is divided into as many front yards as there are exhibitors. Each estate or yard is separated by a vine grown high picket fence, reared on a low red brick base. The several fences are intersected by great grill work gateways, the stone posts of which are topped by flowering urns and set off by lighted

globes. The railings at the sides of the several yards which also are set on brick bases are much lower than is the picket fence. Near each gateway is a giant tree, 50 or 60 feet high, and with a great outspread of branches, while here and there are numerous smaller trees and shrubs and flowering pots. Four gilded Doric domes supported by slender white Doric columns also are features of the decorative theme.

The exhibits occupying the wall spaces and surrounding the center sections are ensconced in trellises, so to speak; they are located under the gallery and a succession of archways supported here by rough stone pillars and there by lattice work columns gives to each a separateness that is all its own. The overhead trellis is heavily hung with blossoming foliage. The gallery overhead has been transformed to represent a veranda, a false white railing hiding the chicken wire netting that at all previous shows was such an eyesore, and that constituted such a blot on the general scheme. Painted scenery or foliage heightens the veranda effect. Over all there is a great expanse of azure sky daintily flecked with fleecy clouds. It is all very beautiful, too beautiful for mere words, and the visitor

THE NIGHTLY LINEUP OF CARS OUTSIDE THE COLISEUM

COLISEUM EXHIBITS IN THEIR SUBURBAN SETTING

must be deeply interested in automobiles not to be enrapt or carried away by the picturesqueness of the scene.

The Coliseum Annex represents a real trellis garden. There are low fences separating each exhibit and around the walls and again the overhead trellis is thickly hung with blossoming vines. There has been no stinting effort anywhere, and by comparison the alleged trellis garden that formed the decorative theme for the recent show in Grand Central Palace, New York, was a mean and stingy affair and looked like less than the proverbial thirty cents. The signs all are scrollwork with the names of the exhibitors in old English letters.

In the Armory, in which the overflow is housed, there are no estates with towering trees and grill gateways, but there are a lot of flowers and shrubs and other greenery. There is considerable rustic effect and also several of what are officially styled pagodas, but no real pagodas ever looked like these. The sky, what there is of it in the Armory, consists of green and white bunting.

Between the Coliseum and Armory the narrow alley through which most of the exhibits are brought, is threaded by the enclosed board walk which, in the past has been likened to a ventilating flue and a slide-way for the streams of humanity which constantly ebb and flow between the two main divisions of the show, and which has been known more fancifully as "limousine lane." It is a necessary evil since it furnishes the only means of communication between the two principal divisions of the show, but it is generally regarded as a most unpleasant necessity.

It was this same elongated pine box which, early Monday morning, threatened the destruction of the Coliseum, together with the group of more or less dilapidated buildings which cluster around it, when a small fire broke out midway of its length. The threat was not a very ominous one, but it served as sufficient excuse to bring out about all the portable fire fighting apparatus which Chicago possesses, and to excite the local yellow journals to hints of incendi- arism.

What happened was this: In accordance with the rule of the show management that no gasoline should be taken into the Coliseum under any circumstances, the fuel tank of an inward bound car was drained in the alley. In all probability some of the gasoline trickled under the passageway and was ignited by a match carelessly thrown aside. At all events, suddenly and without warning, flames began to play about the outside of the box and creep up through the flood. Two or three of the guards, stationed there by the management to prevent small boys from breaking in or ripping the structure to pieces for kindling wood, at once pulled up a few boards and extinguished the flames with hand apparatus. Had not some excited person turned in an alarm, it is likely that even fewer persons

would have been aware of the incident.

But with memories of the fire which nearly terminated the commercial vehicle section of the show in old Tattersalls, in December, 1907, and with the idea which appears to be ingrained in the breast of the average Chicagoan that the Coliseum is far from a good fire risk, there was some little uneasiness for a few minutes, when the engines were seen headed for the big show buildings. For the benefit of those who remarked on the tinder-like qualities of

A BIT OF RURAL SCENERY

the decorations, however, it may be said that the leaves, at least are thoroughly fire-proofed. Tests made early in the week showed that they would only smoulder, even under the most favorable conditions.

From the New York standpoint, the crowds were almost as interesting as the decorations. They have been large and a goodly portion are unmistakably of the West. Fur caps and cloth caps of the earlap type and felt hats with leather bands are numerous and indicate beyond doubt the interest of the smaller Western communities. They come, these Westerners, with a deep and searching interest in all things pertaining to automobiles. Always they bring interest and their money, frequently they bring their wives and a few children, and occasionally their lunches as well.

But Chicago takes kindly to the unconventional, and so the sight of a party of four picnicking out of pasteboard boxes, while seated in the balcony side aisles, created no comment whatever. It was during the slack period just before the crowds began to come in one evening early in the week. The men of two generations were there with their women, and as they gnawed chicken bones and munched at real home made pie, they discussed various makes of cars with an intelligence and penetration which would be surprising to many who are not familiar with the class which is raising its wealth in the big farm country.

It is the large proportion of real buyers in the crowd which gives to the Chicago show its tremendous importance to the industry. That the crowd comes not only to buy cars, but also to buy parts, accessories and supplies, also is important to note. That the show was not wholly ready to be opened, when the doors were thrown ajar last Saturday afternoon, mattered little to the Western contingent. The Chicago show crowd comes early and often, and is ready to go home promptly at ten thirty every evening.

It being not quite ready appears to be one of the characteristics of all Chicago shows. In fact, the decorators and the huskies who move in the exhibits seldom get away until forced out by the crowd, and the sight of booths empty until Monday night is no rarity. This year, however, the decorations were finished promptly, save one element. That was the "piece de resistance" which it is customary to impose at the head of the stairs leading to the cafe in the basement. A fountain was designed for the important position this year, but its makers dallied too long on the way, and it was not finished Saturday. Monday, work had progressed far enough so that the water could be turned on. But the fountain proceeded to spout in an unforeseen direction, wetting down the floor. Its completion later in the week added an almost unnoticed finishing touch to the ornate garnishment of the real show.

The show itself, of course, partakes largely of the character of the two previous and recent national expositions in New York, of the elements of both of which it is compounded. There are 255 exhibitors in all, 101 of whom display cars, 141 accessories and parts, while 13 show motorcycles. In addition to the material which already has been displayed this year, however, is a goodly share of new and attractive display.

## Striking Features of the Exhibits.

Among the more striking features of the various exhibits may be mentioned the Thomas "tumbling chassis," which was shown in New York, together with such other to-be-expected importations as the 'Round the World trophy, also shown on the Thomas stand; the Alco Vanderbilt Cup winner of last fall, and, of course, the cup

CHASSIS DISPLAY OF THE CHALMERS-DETROIT CO.

itself. The Chalmers "Bluebird" and the big Fiat racing cars also are to be seen, as well as a collection of Apperson, Marmon, Knox and other racing trophies.

Such of the spectacular accessory displays as are to be seen are for the most part held over from New York. There is the big Splitdorf magneto, which shoots off big sparks, as everyone can see, and at least one jumbo carburetter. There also is the model aeroplane, which hovers over the G. & J. tire booth. One new single spark ignition system is shown, and one new magneto, the latter of most radical principle and form. There is a new demountable rim as well. Startling outcroppings in the accessory field, however, are less numerous than in former years. But one noteworthy trend is strongly evidenced: that is, in the direction of electric lighting. Practically all lamp manufacturers exhibit show electric models in some form or other, while on the stands in the Coliseum and Armory a number of display car models, which were not so equipped in New York, now carry incandescent bulb lights. One of the new cars, in fact, is fitted with lamps of special and most ingenious design.

In the same connection mention should be made of one striking novelty in the illuminating line—a direct importation from

abroad, said to be an idea "borrowed" from some titled dignitary—which is shown on one of the cars exhibited by C. P. Kimball & Co., the Chicago body makers. Unfortunately, owing to the obscure position of the car itself, the novel mounting of the lamps in the glass of the wind shield escapes the casual observer; nevertheless, they are worth seeking out. Adding to the effect of the regular dash lamps, which also are electrically equipped, the lamps in question are mounted above the dash, at either end of a narrow glass panel which forms the lower section of the shield. The lamp bodies are of the same general form as the familiar dome lights commonly used for interior limousine lighting. But the front glass is so constructed that its sash ring serves to clamp the entire lamp to the glass of the shield, which is cut away to permit it to be installed. The conductors are led to the lamps in fine brass tubes, which are inconspicuously mounted on the back side of the dash. The effect is both new and striking, especially so as the lamp glasses are cut, causing the light to be emitted in bright scintillations.

#### Striking and Novel Body Designs.

As usually is the case, Chicago is the meeting ground for a number of manufac-

turers who see fit to alter their show displays during the brief interval between the big expositions of the eastern and central sections of the country. Indeed, it may not be too much to say that the Chicago show ordinarily brings forth quite as much of new color contrasts and up-to-date patterns in bodies and equipment, if not more, than either the Palace or Garden efforts at New York. In part, this may be due to the fact that Chicago itself boasts a number of accomplished and resourceful carriage makers. The Kimball bodies are examples which would lead to this impression, as is the particularly pleasing inside driven coupe body which is the work of the Chicago Coach & Trimming Co., and which is mounted on a Berliet chassis.

Aside from the good lines which this vehicle reveals, it is distinguished by unusual length of interior accommodation, as well as by a single "jump" seat, which is placed in front of the driver's companion, but which may be folded down into the hooded sash when not in use. The rear deck of this machine is minus the usual "dicky seat," but instead carries a round storage tank, on the flat rear deck about which spare tires may be placed.

Mention also should be made of the odd coincidence by which the three distinctive

WHERE RAMBLER CARS ARE STAGED

and elegant limousine effects produced on the Pierce, Studebaker and Winton cars are enhanced by three new and hitherto unexhibited samples of exclusive lamp design, all three being of the same style, though differing materially in detail. The general effect is that of an antique, many sided lantern, tapering to an apex at the bottom, which is ornamented by a ball or other ornamental finish. Needless to say, the form is such that electric equipment is the only practicable one, as well as the most suitable.

A striking car is shown on the Thomas stand, most conspicuously colored orange yellow. It is a limousine of the six-cylinder form, which has black guards and body base. Electric cars, such as the Columbia, "Mark LXX" landaulette—which is an inside driven affair—of course, are fine mediums for displaying the carriage maker's ingenuity. The Babcock is one of those which is somewhat extraordinary in its coupe form, with its outside driver's seat and green show finish. An example which is effective in another way is the little Columbus runabout which is shown in the basement, and which is of light and compact design and finished in grey. A different shade of gray, and a car of more luxurious proportions, is the inside driven

coupe which is exhibited by the Anderson Carriage Co.

#### Cars in All Colors of the Rainbow.

On the whole, color combinations appear to have been in the minds of those who have had to do with staging the exhibits, perhaps to better effect this year than ever before. In the Armory, for example, are to be seen Brush studies in red and orange, a vehicle of the latter hue being equipped with a form of luggage carrying box back of the seat, which was not shown in New York. The contrast selected for the Pullman display is in red and primrose. On individual bodies striking effects sometimes are to be observed, as in the "catchy" looking Matheson Six roadster, which to an observer on the highway probably would give a distinct impression of a most rapid shade of vermillion, but which, on close inspection, is seen to be set off with a black body box lined in red, while the red portions of the remainder of the vehicle are toned down with black lines.

On the adjoining stand a similar effect is secured, though in a very different way, on a Corbin roadster, in which the underside of the mud guards is painted red, while the tops of the guards and the lower part of the body are black. The rest of the

machine is red, very red indeed, even to the seats. Other effective color combinations both in individual bodies and in the exhibits taken as a whole, are to be found on the stands of the Pope Manufacturing Co., Chalmers Motor Co., Pierce-Arrow Motor Co., Haynes Automobile Co., and Maxwell-Briscoe Motor Co. The Packard white and gold car again is on view, as is the pink and silver American Simplex.

As was the case at New York, the runabout, distinctively as such, is not over prominent. One or two new examples are found, however, as well as several which were seen at New York, among the latter being the Haynes and the Premier speed car. A particularly neat and attractive little Mitchell is on the main floor of the Coliseum, finished in the standard black body and cream colored running gear. It has a single rear rumble, and the front seat is hooded under a well-drawn buggy top. A newcomer in the same line is the Lambert, which has an oval fuel tank mounted back of the seat, and which is equipped with pedal motor starting gear in place of the usual crank.

#### A New Crop of Torpedo Bodies.

But perhaps no feature of the show is of more modern fashion than the torpedo

aggregation, which is considerably more numerous than that at New York, even combining the exhibits of the two shows. Among the new models may be mentioned the Inter-State, which is of particularly happy form. Its distinguishing mark is the dash, which is drawn to form a direct and logical extension to the bonnet. Another is the new Staver body, which is neatly and compactly drawn, and reveals considerable study. Other new mountings of this class are the Stoddard-Dayton and Mora. Such conspicuous examples as the Franklin, Winton, Speedwell, Cole "30," Selden and Marmon, have been seen before, as have the Royal, the White and the Columbia.

While several makers this year have abandoned the practice of presenting a special show chassis, carefully polished and fitted, others have adopted the plan who never have made use of it before. Thus there is no dearth of ornamental chassis at the show, nor of sectioned and working models. The new Rambler is one of those which is given a mounting de luxe, over a heavy plate mirror. Another striking example is the Speedwell. The Matheson chassis, of which there are two, one of the six and the other of the four cylinder models, are finished in combined polish and enamel, very handsomely. The same in a general way applies to the Stearns chassis, of which two also are shown, one of the large and one of the small cars. Jackson, Speedwell, Hudson and Stevens-Duryea are others shown in polished chassis form. The Haynes display is a very pretty combination of polished and enameled metal.

#### Three Point Suspension of Midland.

One of the most striking of the several sectioned models is the Midland, which was not shown in New York, and which affords a very clever demonstration of the advantages of the three point method of suspension. Three brass pointers are mounted in the middle of the chassis and extend upward for a foot or so, one being carried on the rear of the gear box, one on the cross frame member which supports the rear end of the torque tube itself. In addition to this, the front axle is lifted and supported in a pivot, in such a way that the two front wheels may be alternately raised and lowered by rocking the fore part of the chassis back and forth. At the same time, the rear wheels are in their usual position on the floor and remain absolutely motionless.

The result is that when the front of the chassis is rocked a very appreciable weaving movement is set up in the frame, the effects of which are visible in the movement of the pointers. The motion also suffices to show that the combination trunnion and slide block mounting for the forward end of the motor, together with the trunnion mounting of the rear end of the power plant in the ball and socket bearing which is carried by the frame, absolutely protects

the active elements of the chassis from injury due to severe road stresses.

Pennsylvania motor construction, Premier make and break igniters, and the Marmon lubricating system, are demonstrated by means of special moving models. The working of the chassis of the Reo, Elmore two-cycle, Hudson, Chalmers, Brush, and Everitt "30" chassis, is shown in each in-

who make it a practice to visit all shows, and more particularly the great array of tradesmen, there are no less than five brand new and hitherto unexhibited products—namely, the Sterling, Lion and Livingston, in the pleasure field, and the Clark and Monitor, in the realms of the commercial vehicle.

Makers who have exhibited in former

PIERCE-ARROW CARS IN BEAUTIFUL SETTING

stance, by moving and sectioned models, while the unique construction of the improved Franklin motor is illustrated on the stock chassis which is used for demonstrating purposes.

#### Newcomers at the Coliseum.

From the standpoint of the Chicago showgoer, the Coliseum is well stocked with cars which are new in the local eye. First of all there are such cars as the Everitt "30," White gasoline, Hudson, Ohio, American Simplex, Fal, Springfield, Cole "30," and Metz, which, though shown in New York and elsewhere this year, never before have appeared in the Windy City. For those

years, but who are making their first big show appearance for the present season at this time, include the builders of the Rambler, Auburn, Dorris, Diamond T, Fuller, Great Western, Rider-Lewis, Springfield, Richmond, Zimmerman, Austin and the R. A. C., which formerly was known as the Ricketts.

#### Originality in Sterling Clutch.

Naturally, general interest centers most strongly upon the brand new cars. Of these characteristics, the Sterling is one of the several new cars which, though generally standard in form, yet possess one or two points of decided originality. Sterling prac-

tice has decreed the use of the four-cylinder engine, axle mounted gearset, standard control and generally approved forms of body design. The engine is of the type in which the inlet valves are mounted in offset pockets, while the exhausts are carried in the heads, and in which the valve actuation is accomplished by means of a single cam shaft which is mounted on the

The unique feature of the machine is the clutch, which is of original and ingenious design, embodying a modification of the multiple disc principle. Its derivation from the multiple disc is not self-evident, however, since it exists only in the adaptation of multiple surfaces with the use of but a single thin disc of the accepted type. Briefly, the driving relation is secured by

ing apparent when it is stated that the effective diameter of the organ is only  $5\frac{1}{4}$  inches, and its length 4 inches. All wear is absorbed by fiber discs interposed between the active surfaces, and provision for adjustment is made by threading the cover onto the housing, so that it may be screwed up a half turn or more when the parts within become slack.

Sterling cars are produced in two sizes of chassis, with  $4\frac{1}{4}$  by  $5\frac{1}{4}$  inch and 4 by 5 inch motors, respectively, and 118 and 115 inch wheel bases. In other respects the two are much the same, however, even to the use of three-quarter platform rear springs with all styles of body. The varied types of the latter, however, combine to form a line of seven different types, among which is a particularly effective little speedster model.

## Electric Lighting for the Lion.

So rapidly has the cause of electric light been advanced within the last few months that it no longer may be considered surprising for a manufacturer to list electric, or at least combination lamps, as standard equipment. Thus it is distinctly in line with the trend of the times, though advanced practice, for a car maker to build the lamps into his car, so to speak, which is the method which has been adopted in the construction of the new Lion. Revealing not a few distinguishing marks, this new product of prolific Michigan is rendered conspicuous by reason of the fact that its electric lighting equipment is not only of exclusive design and of special construction as well, but that the dash lamps are bedded solidly against the dash, which is designed especially to accommodate them. Both sets of lamps have a special focusing device, whereby merely turning a thumb screw at the back serves to advance or withdraw the bulb toward or away from the reflector. Energy for lighting the lamps is secured by the use of storage batteries.

The car is equipped with a unit power plant, hung on three points, the single support being in the rear and taking the form of a journal on the rear of the gear case, which has a bearing on a cross member of the frame. This bearing is of very liberal proportions and is calculated to allow for considerable frame weaving, should that at any time be demanded by the exigencies of severe road service. The motor is of exhaust valves mounted in the heads and inlets carried in offset pockets, and in general is of not unfamiliar form and construction. One of its unusual details, which is worth noting, is the use of the fan bracket as a crank case breather. The bracket, which is of cast aluminum and liberal in size, is cored out to a point near the offset upon which the spindle of the fan is journaled, and the opening is extended through the top. This leaves a clear passage to the gear housing, which, being in communication with the crank case proper, serves

THE MAXWELL-BRISCOE CO.'S ATTRACTIVE DISPLAY

right side of the engine. Commendable features in its construction are the ample jacketing of the exhaust valve as well as the combustion chamber, and the funnel-like increasing taper of the exhaust manifold; these points being intended to ensure a clean working engine with absolutely unhampered exhaust. The gearset, which is of the three-speed selective type, is built into the torsion tube and axle unit, the alignment of the axle being ensured by means of diagonal braces running forward to a point just back of the universal joint whereby the torque tube is supported in the frame.

pinching a flange formed integral with the driven member between the clutch body and a single saw-blade disc. The action of engagement is secured by forcing radially outward a set of four segmental wedges, which cause a pair of convex discs between which they are mounted, to expand in the direction of the clutch axis. This has the same result as would be secured by exerting direct spring pressure, but greatly reduces the necessary spring tension. As a matter of fact, it is claimed that absolutely satisfactory results are secured with only a 30 pound spring, the efficacy of the wedging system at once be-

as an avenue for the escape of superfluous gases. The cylinders are of  $4\frac{1}{2}$  by 5 inches dimensions. Magneto ignition is a standard feature. Lubrication is accomplished by means of a crank case circulatory system with pump actuation.

The gearset is of the three-speed selective type, with the lay shaft lying in the same plane as the driving member. An enclosed cone clutch is used. Final drive is through an enclosing torsion tube. With 36 by  $3\frac{1}{2}$  inch tires and 110 inch wheel base the car is produced in both touring and roadster types, the equipment being complete with either type.

#### Good Points in the Lexington.

Another of the newcomers, as far as the show is concerned, although one which is well seasoned in service, is the Lexington, a solid and rather stylish looking machine which is produced in two chassis models and is shown in standard touring form. The larger model is of 40-45 horsepower rating, and has a four-cylinder motor of  $4\frac{3}{4}$  by

THE NEW RAMBLER TOURING CAR

inch tires, and otherwise is proportionately smaller all around. Save that it has full elliptic rear springs with the scroll end formation, it is of much the same design as the larger car, however. Needless to say, it is made to sell at an even more attractive price than the other as well.

attached to the display of the new line upon which the immense Kenosha plant is engaged. In many respects, the new Rambler resembles its immediate predecessor, though several important refinements are to be observed, as was the case a year ago, when the spare wheel idea first was adopted. Needless to say, this feature, which is an exclusive one, insofar as American practice is concerned at the present time, is continued.

An important innovation is the improved clutch, which is of the expanding shoe type, with a powerful and very easily applied toggle mechanism used to operate it. The two friction members have a perfectly straight line movement along one diameter of the clutch so that they engage uniformly throughout their surfaces. They also disengage simultaneously—which is an important point when it comes to the question of gear shifting.

In the engine sundry changes of a more or less inconspicuous nature have been effected, such as the placing of the water pump in front of the timing gears, and an alteration in the arrangement of the exhaust piping, such that the waste gases have a smooth and gently curving path clear through to the muffler, instead of being subjected to more abrupt bends. Incidentally, the manifold now is tapered gradually from

THE NEW INTER-STATE TORPEDO

5 inch cylinder dimensions. The cylinders are individually cast with both sets of valves offset and mounted on the left side. The regular ignition equipment is of the jump spark order, with storage battery used as a source of energy. As shown, however, double ignition is provided, a useful feature of its installation being the use of independent brass conduits for the high tension wires of each half of the double system. The two are mounted over the cylinder heads and between the two water distributing pipes, and serve to separate and protect the wiring in such a way that each method of ignition is rendered as nearly independent of the other as is possible.

A three-speed selective gearset, mounted in the waist of the chassis is employed, together with the familiar H segment form of control, and a plain cone clutch. Drive is by double jointed cardan shaft, with triangular torque rod. The tire sizes are 36 by 4 inches, the wheel base 122 inches, and the spring equipment is semi-elliptical both front and rear. The smaller model has a  $4\frac{1}{2}$  by 5 inch motor, rated at 35-40 horsepower, 116 $\frac{1}{2}$  inch wheel base, 34 by  $3\frac{1}{2}$

#### Improved Clutch of the Rambler.

Owing to the announced intention of Thomas B. Jeffery & Co. to produce only a limited number of cars during the current year, and to raise the quality of the product to an even higher plane than it had occupied before, if possible, considerable interest

THE PIERCE-ARROW LIMOUSINE

THE LEXINGTON FIVE-PASSENGER TOURING CAR

front to back, in such a way that there is no chance for the gas to be strangled.

Another innovation of a most striking nature is the new arrangement of the double ignition system which provides for the use of but a single set of spark plugs. Formerly two sets of plugs were employed, one for the magneto and the other for the battery and coil system. Now, with the single series of plugs and wires leading to the individual switches, which provide ready means for isolating any of the cylinders at will, a high tension multiple switch is provided on the dash whereby the energy from either source may be directed to the cylinders. The switch itself consists of a rotor with handle attached, to which the plug leads are fastened; and a set of eight permanent contacts, to which the two sets of secondary wires from the two respective systems are connected. The arrangement of the connections is such that either system may be thrown into action by setting the distributor switch properly and then switching on the primary by means of the usual device such as is employed on most double ignition systems.

#### New Features of Springfield Cars.

Springfield cars formerly were made in the Massachusetts town of that name, but now are produced under improved conditions in the community in Illinois which bears

the same cognomen. As a somewhat remodelled and considerably improved product, it is of considerable interest to the seasoned showgoer. To the Chicago eye, however, it is an entire novelty, since it never has been shown here before. With an eye to introducing the impression of "custom quality," it is known as the "made-to-order" car. Actually, it is of generally standard

THE KNOX "DOUBLE-SIX-SIXTY" TORPEDO

appearance in regard to its mechanical characteristics, but revealing the touch of ingenuity in a number of points.

Thus, for example, the throttle mechanism, instead of being connected with the ratchet lever on the steering wheel by means of linkage, such as might be liable to develop the uncertainties resulting from

lost motion in the course of time, the throttle arm on the carburetter is fitted with a roller which bears against a cam on the actuating shaft. A spring holds the arm against the cam surface, and the result is that there is absolutely no chance of lost motion at any time. Similarly, the timing lever which is connected with the magneto is hooked to the contact breaker ring by means of a rather heavy yoke, which likewise is contrived with an eye to durability and the elimination of needless play. The accelerator pedal, which is mounted in a new way on the latest model, is arranged to open the throttle only to about half speed. The full acceleration is obtained only by the use of the hand lever.

The change speed gear, which is of the three-speed selective type, is fitted with a new style locking device, which takes the form of a double fingered yoke, thrown by the shifting rocker arm itself. It is important to note, moreover, that the transmission in its entirety now is produced in the Springfield Motor Car Co.'s own plant,

and that preparations are being made to increase the production to include axles, steering gears and other important parts. The machine is of the four-cylinder vertical type, with cylinders 5 by  $4\frac{3}{4}$  inches bore and stroke, and rated at 50 horsepower.

#### Selective Lever Action of the Fuller.

The Fuller appears for the first time in four-cylinder form, and with the general outward proportions of approved practice in every respect. It is one of the limited number of makes of car to be equipped with that delight of the non-mechanical user, the planetary change speed gear. The gear is mounted just back of the fly wheel and drives through an enclosed cardan shaft to the live rear axle. Some little originality is displayed in the arrangement of the mechanism by which it is controlled, in that a selective action is given to the single side lever. Ordinarily, movement of the lever serves merely to engage or release the emergency brakes, that system, which is enclosed and mounted on the rear wheels, being applied when the lever is drawn back. When the lever is pushed forward, while a thumb latch is pressed down, however, the high gear is engaged. Such is the arrange-

THE NEW RAMBLER LIMOUSINE

HAYNES MODELS IN PROMINENT ARRAY

ment that for an emergency stop it is possible to pull the lever straight through from the high speed to the braking positions, without touching the latch. Low speed forward and reverse movement are pedal controlled.

The new model is driven by a four-cylinder block type motor of 4 by 4 inch cylinder dimensions. It has 100 inch wheel base and 32 by  $4\frac{1}{2}$  inch tires. It is shown in roadster form, but also may be had with two passenger rear seat, or in full tonneau form. Full elliptic springs all around is a part of Fuller gospel. Therefore this exceptionally elastic combination is found on this, as on the other model shown, which is a continuation of a former type, and mounted on solid tires of 36 inch diameter.

The latter is displayed in four-passenger style, with detachable rear seat, and is of

the buggy type in outward appearance, though of much more solid design and construction than the average motor buggy. It is equipped with an opposed engine of  $5\frac{1}{4}$  by 4 inch cylinder dimensions and rated at 20 horsepower, which is 2 horsepower greater than last year's machine, the cylinder sizes having been increased slightly. Transmission is by planetary change gear and torque tube rear axle arrangement, this form having superseded the unenclosed shaft with two cardan joints which was employed on the previous car of the same general form. Listed as a different model, the same mechanism in most respects also may be had with smaller wheels and pneumatic tires, while with the solid tire equipment it is produced in two different forms of commercial wagons suitable for light delivery purposes.

#### Brake Connection of the Diamond T.

One of Chicago's own products is the Diamond T, also it is a very natty little car, shown at the present exhibition in the form of a roadster with single rumble seat. It has a four-cylinder,  $4\frac{1}{4}$  by  $4\frac{1}{2}$  inch engine, which turns up 38 horsepower, and is of standard form, with cylinders cast in pairs and valves mounted on the right. A rearrangement of the timing gears and the use of brass cylinder caps which establish the water connections are new elements in its design, the latter contributing some distinctiveness to the appearance of the motor. Although the general makeup of the machine remains much the same as heretofore, a few alterations have been made, as for example, the relocation of the steering gear. This is now placed on top of the frame, where it affords a better arrangement for the steering connections and cleaner construction in general, and also gives opportunity to increase the rake of the steering column.

As formerly, both sets of brakes, which expand and contract on a single drum on each of the rear wheels, are interconnected and work together. In the previous model they were cross connected and equalized. Now the brakes on either side are connected in a much simpler way with a single rocker arm, and are not equalized from wheel to wheel. The object of this is to provide against disability of the entire braking system in the event of a breakdown on one side. Equalized pulls on both brakes on each side are secured, however, by the very simple device of connecting the two brake arms to the rocker by means of a cable and sheave. This provides against irregular application of the expanding and contracting shoes. Both

WHITE GASOLINE AND STEAM CAR EXHIBIT

WHERE PREMIER CARS ARE STAGED

the hand lever at the side of the car and the foot pedal apply the brakes, but neither of them is interconnected with the clutch.

#### Engine Changes of the Great Western.

While the tendency with some makers is to multiply the product by increasing the variety of models produced, with others the trend is toward as great a condensation in this respect as possible. The Great Western is a product of the latter order. Known as the Great Western "30," it is built in but a single chassis type, though variations in body design of course are possible. In general design it remains much the same as heretofore. The engine, which is one of its characteristic features, is the pioneer in a class which has become quite extensively used, and in which the exhaust valves are placed in the heads and the inlets in offset pockets, the arrangement of the exhaust ports and manifold being a distinguishing feature because of the way in which they affect the external formation of the cylinder castings.

Engine changes introduced into the new model include the enclosing of the two-to-one gear at the front of the crank case and a quarter-inch enlargement in the bore, among other things, the cylinder dimensions now are  $4\frac{1}{4}$  by 5 inches, bore and stroke. The engine oiling system is of the crank case constant flow type, with a pump mounted on the end of the cam shaft. Other chassis changes include the lengthening of the wheel base from 106 to 112 inches, the adoption of 34 by  $3\frac{1}{2}$  inch tires, double brakes on the rear wheels, three-quarter elliptic rear springs and enclosed shaft drive, in place of the unenclosed shaft and radius rod drive which formerly was used. The new body design adopted also

has considerably improved the external appearance of the machine.

#### New Four-Cylinder Rider-Lewis.

Rider-Lewis cars first were produced in six-cylinder form, with an original form of valve-in-the-head motor, axle mounted change speed gear and other commendable features. That model is reproduced at this time in its entirety, save for the use of 36 by 4 inch tires in place of the original equipment, which was 34 by 4 inches, and the adoption of the Bosch dual ignition system, instead of the less highly developed system of the same specialist, which immediately preceded it.

To the Rider-Lewis six has been added a new four-cylinder model designed along

much the same lines, but equipped with an original and pleasing form of block motor. The valve gear, which, as on the six, is of the overhead cam shaft type, is fully enclosed, as are all working parts about the new motor. Unlike many engines of its class, however, it is subdivided into several rather ingeniously cast units. The cylinder heads and mounting for the valve gear constitutes one unit, the cylinders another, the water outlet and the water inlet two others, and the crank case and sub base oiler a fifth and sixth. The crank case especially is noteworthy. It is of the plain barrel type, with supporting members separately cast, and forming stout bands surrounding the case. A very heavy yoke distinguishes the torque

MATHESON CARS IN IMPOSING DISPLAY

tube construction, while the rear of the chassis is suspended on full elliptic springs, in distinction from the three-quarter elliptic members, which are used on the six.

#### **New Locking Device in Dorris Gear.**

Few changes have been made in the construction of the Dorris, which has remained practically standardized for several years. Its characteristics of the more conspicuous order are the unusual method of suspending the change gear housing, which is rigidly attached to the engine base in unit power plant form, the method of clutch and gear shift interconnection and the system of brake equalization. The method of driving the speedometer from the transmission, instead of from one of the front wheels, which was adopted last year for the first time, is continued. But in the new cars the driving gear is entirely enclosed in the gear case, thereby being protected from the effects of dust and dirt, while the arrangement also affords better means for attaching the flexible shaft, as well as reducing the necessary length of shaft employed.

A new arrangement of the brackets supporting the rockers of the valve actuating mechanism eliminates the protruding elements which formerly were observable and affords a much neater and more effective method of mounting. The exhaust manifold has been rearranged and now gives a nearly straight line flow of gas to the muffler, the manifold also being of the enlarging, or funnel, type. The change gear mechanism itself remains the same as heretofore, but a new locking device has been introduced for retaining in the neutral position the sliding set which is out of use. It consists of a short horizontally swinging lever, pivoted at one end and engaged at the other by the rocker arm. As the rocker arm is moved across the car in the act of selection, the lever is swung from one extreme position to the other, a finger extending from its lower side thereby being made to engage one or the other of the two "pull-out" rods, to which the gear shifting forks are attached.

#### **Novel Battery Arrangement of R. A. C.**

New in name, and practically a new vehicle, the R. A. C., which is a direct and logical successor to the Ricketts Six, of a year ago, is shown in considerably improved form. The motor, which is of original design and construction, is of the valve-in-the head type, embodying the push rod and rocker method of actuation. Its cylinder dimensions are 4.3-16 by 4¼ inches, and its rating is 50 horsepower. One rather unusual feature is the use of demountable cylinder heads—this method of construction permitting a clean and inexpensive form of cylinder casting, and also affording ready means for cleaning the cylinders without tearing down the entire power unit.

Double ignition is a stock feature, and in connection with the battery system an unusual and commendable expedient is

found in the method of mounting the battery box. Instead of being carried on the running board as is common practice, it is mounted under the hood in an otherwise unutilized space just back of the radiator and on the right side of the engine. One of the several advantages claimed for this arrangement is that it greatly reduces the length of primary wiring required, thereby reducing the liability of breakages in the conductors.

The unit type of power plant is employed, the fly wheel and clutch being unenclosed. The latter is of the cone type with cork inserts, and so contrived that it can be dismounted without disturbing any other members in the transmission line. The change speed gear is of the constant mesh, sliding dog clutch type, with stepped tooth clutch jaws; it is so constructed that on the direct and high speed, no gears are in mesh. Final drive is through a propeller shaft and full floating rear axle of approved pattern. With the seven passenger body, no less than 142 inch wheel base is used, together with 36 by 4½ inch tires. The roadster and small tonneau types, however, have 133 inch wheel base and 36 by 4 inch tire equipment.

#### **Low Wheels on Zimmerman Cars.**

Formerly producers of high wheeled vehicles exclusively, the Zimmerman Manufacturing Co. during the last year has been fitting at least one of its models with low wheels and pneumatic tires. That model, which is equipped with a twin cylinder opposed engine, has been reduced \$50 in price, but at the same time has been improved in one or two details, as, for instance, in the adoption of a better form of spark coil than used to be employed, and in improved accessories.

The crowning achievement of the entire product, which includes, in addition to the 16-18 horsepower model made either in low or high wheeled form, a surrey of the same type mechanically, is the new four-cylinder car. This is a perfectly good looking car of 35 horsepower, having standard features, pneumatic tires of 34 by 3½ inch dimensions and a 4.5-16 by 5¼ inch motor, vertical, water cooled, and equipped with the Splitdorf magneto. It has semi-elliptic springs in front and double scroll rear equipment, 115 inch wheel base, and a complete equipment.

#### **Auburn in a Larger Model.**

The new Auburn car is an up-to-date and attractive machine of 35-40 horsepower, with 4½ by 5 inch cylinders, selective, shaft transmission and other approved elements. The transmission gear and multiple disc clutch are enclosed in a unit housing, independent of the motor but very neatly contrived to afford the proper support for the live parts and also protect them from the inroads of dust and dirt. In the standard touring model it has 116 inch wheel base, 36 by 3½ inch tires and 10 inch clearance.

The spring suspension is semi-elliptic in front and full elliptic in the rear. It is produced in touring, small tonneau and roadster models. The twin cylinder opposed engine car, which has been the standby of the Auburn Automobile Co. for a number of years, still is retained under stimulus of demand, as is estimated. Only the new four cylinder model is on exhibition at the show, however.

#### **New Richmond Model Water Cooled.**

Save that the cylinder bore has been increased by ¼ inch, the standard model of the Richmond car has been changed but little from its former construction, as far as regards the standard model. A radical change has been introduced into the line, however, by the adoption of a water cooled model. Heretofore, the Richmond has been air cooled exclusively. The new water cooled model is identical with the standard type, save in respect to the method of keeping down the cylinder temperatures. With a new crank case oiling system and a little longer wheel base, both models, which are made in runabout and touring form, exhibit the same general specifications as have ruled in previous types of the same vehicle.

#### **Larger Motor for New Austin Car.**

Austin cars are of the solid looking, quick acting type which has gone so far toward stimulating the demand for the big and luxurious sort of car many people just yearn to possess. They are built largely in six cylinder form, and for several years have been distinguished in the shows by the conspicuous chocolate and white color scheme which is an unmistakable and exclusive earmark of the maker. A new model shown, which is of 50-70 horsepower rating, has practically the same specifications as the older and standard 60 horsepower car, save for the motor, which is of 4½ by 6 inch dimensions.

#### **Unique Claims of Berliet Axle.**

Berliet cars, exhibited for the first time this year in America, though familiar enough to those who attended last year's show, reveal to those who are anxious to study the foreign car transplanted much of mechanical interest and structural excellence. One evidence of the extreme pains which are taken to produce a satisfactory result is shown in the method of forming the live rear axle casing. As to the two end sections which form its principal portion, they are forged in the form of solid steel billets and afterward turned and bored to size. The process is expensive; but it leaves the metal close grained and uniform as to strength, and ensures extremely long life for the axle.

#### **Commercial Cars Hard to Find.**

No commercial vehicle section is to be found in the show, and the exhibits of such business vehicles as are on view are

THE LOCOMOBILE CO.'S EFFECTIVE DISPLAY

scattered widely. Counting the Clark and Monitor products, which already have been mentioned among the new vehicles, there are but eight representatives of the utility type. These are the Gramm-Logan, Rapid, Grabowsky, Brush, Schacht and McIntyre. The Schacht Manufacturing Co. shows a delivery body fitted to a chassis adapted

from its so-called "three purpose" car, the same as was shown at the Palace in New York. The Little Brush runabout, which, as is well known, has been made in straight delivery form, is shown mounting a capacious but not unwieldy box behind the seat, suitable for drummers' sample cases or for light merchandise. The McIntyre offering

is entirely new, insofar as show display is concerned.

#### **New Power Plant for McIntyre Cars.**

While the W. H. McIntyre Co. has produced commercial vehicles equipped with twin opposed engines before, the machine exhibited in the Armory is the first to be fitted with a four-cylinder vertical motor and further is distinguished by a demountable type of power plant. By removing four bolts, the motor, change gear, radiator and accessories may be withdrawn as a unit. The drive is by propeller shaft to a counter shaft, differential equipped, from which point the final transmission is by double side chains. As shown, the equipment is an open express body. The rated capacity is 2,000 pounds.

#### **Live Axle for Clark Wagon.**

The Clark delivery wagon is one of the two hitherto unexhibited commercial products, like its neighbor, indigenous to Chicago, and an unusually rugged looking machine of its class. Indeed, unlike the ordinary delivery vehicle, it is built more upon the lines of the average heavy duty truck, reduced in proportion to the load, of course, than after the manner of the modified pleasure car or reformed carriage. Aside from its substantial appearance in general, one of its most striking characteristics is the rear axle construction, which is of original design. That member is of the full floating type, with unusually massive torque tube enclosing the propeller shaft. The forward end of the tube is carried in a ball and socket joint on a cross frame member. But the traction load is absorbed by radius rods, which lie directly beneath the frame side members. Selective, three-speed change gear is another of its rather unusual features, this equipment being carried just back of the motor and in the center of the chassis or thereabouts.

The engine equipment exhibited at the show is of the twin cylinder opposed type. The permanent power equipment, however, will be a four cylinder block motor of most modern form, built expressly for the Clark Co. Its cylinder dimensions are  $3\frac{3}{4}$  by 5 inches, and its rating 24 horsepower. It is of the block form, with valve stems and springs enclosed, and in replacing the engine shown, will not alter the construction of the car in any other material respects. As is customary with the more advanced class of commercial vehicle builders, the body design is left chiefly to the option of the purchaser. The vehicle shown is equipped with a light express body with standing top, which may be fitted with cross seats for purposes of passenger haulage, if desired.

#### **Twin Motor for the Monitor.**

Exhibited for the first time, though not a new product, the Monitor, which is a Chicago development of the medium capacity class, is built specifically for delivery work, yet is capable of standing much

THE NEW LION FROM MICHIGAN

THE GREAT WESTERN FROM INDIANA

heavier loads than the ordinary run of deliveries is supposed to call for. It is built upon sturdy lines, with 34 by 2½ by 3 inch solid tires front and rear, respectively, and semi and full elliptical springs under the front and rear. Its power plant is of the convenient and eminently suitable double opposed type, with planetary change gear and shaft drive. The engine is placed below the chassis line and under the driver's seat, and is mounted on a sub-frame, which runs far enough to the rear to carry a cross member which supports one of the two transmission bearings. The second transmission bearing is carried by a cross member of the main frame.

The method of mounting the rear axle is a little out of the ordinary from the mechanical standpoint, in that the radius rods, which are used to take up the driving stresses, instead of being carried parallel with the frame sills, are bent inward just in front of the axle and are attached in front to the cross frame member mentioned as carrying the rear transmission bearing, being coupled close together on either side of the driving shaft. In this way they fulfil much the same function as the diagonal braces which commonly are employed in connection with one rather popular form of torque tube construction. The cylinders are of 5 by 4 inch dimensions, and the rating 20 horsepower.

#### Sprinkling of Electrics at the Show.

Like the commercial products, electric vehicles, though well represented, are scattered throughout the show in such a way that it must be an ardent seeker indeed who finds them all the first time around. The list includes the names of such well known producers in this line as the Woods Motor Vehicle Co., Babcock Electric Carriage Co.

Baker Motor Vehicle Co., Studebaker Automobile Co., Columbia Motor Car Co.,

Rauch & Lang Carriage Co., Columbus Buggy Co., Anderson Carriage Co. and the Waverley Co.

#### Buggy Type Dwindles.

One time sufficiently important, numerically speaking, to warrant treatment as an individual class of vehicles, the high wheeled motor buggy has dwindled well-nigh to the vanishing point. Of the several manufacturers represented on the Coliseum and Armory stands who formerly produced that class of machine, or who now produce it, it is a remarkable fact that none exhibit the true high wheeled vehicle. This statement may be explained by saying that of the very few who exhibit pleasure cars fitted with solid tires, none of those observed employ tires of more than 37 inches greater diameter. Those who do produce vehicles of this class express their faith in it, and predict a long-continued demand for it in limited quantities. But their position is explained by the admitted expectation that the bulk of future trade will be with the more "regular" type of machine.

Of those showing solid tire equipped vehicles, there are the Zimmerman Manufacturing Co., and Fuller Buggy Co., with 36 and 37 inch wheels, respectively, and several of the makers of commercials. One apparent convert to the large wheel idea is the Metz. Since the New York show this little machine has been placed on 33 inch wheels, at least optionally, by way of concession to the supposed western inclination, it is to be presumed. But close inspection reveals the fact that it is shod with 2½ inch pneumatic tires, and therefore that, in proportion to its weight, this equipment places it in about the same class as some of the larger cars shown upstairs. The pioneer builder in the high wheeled line, having run upon a financial shoal recently, did not exhibit, although listed in the preliminary official roster.

STEVENS-DURYEA SMALL TONNEAU

STEVENS-DURYEA TOURING CAR

## "Old Stagers" Crowd Newcomers in the Accessory Section.

Either it is the case that new exhibitors of accessories are not developing so rapidly and changingly in the Chicago show's sphere of influence as in the past, or the giving over of the Coliseum basement to cars exclusively has, so reduced the space available for the new accessories as to

netic circuit, and the construction allows the doing away with all moving wires, brushes, commutators and the like. Instead of rotating in a vertical plane, as provided for in most magnetos, the inductor rotates in a horizontal plane, and it consists only of a piece of laminated steel on a shaft.

rotating inductor, so that by removing the distributor cap the timer blade and distributor are in full view and of easy access. The current is transformed to high tension by means of an outside coil, which may be mounted on the dash or in some less conspicuous place. Advance or retard of the

VARIED ACCESSORIES DISPLAYED AMONG THE GIRDERS IN THE COLISEUM GALLERY

leave but a comparatively small list of them to vie with the veterans which previously were staged at New York. At any rate it is only here and there that space is found for an accessory concern making its this year's initial exhibit in the Windy City.

Most radical of the products to make their first bow is the Webster-Milton high tension magneto, made by the Webster Electric Co., of Tiffin, O., and exhibited by the Excelsior Supply Co., of Chicago. At no time is there an open gap in the mag-

Straight bar magnets of tungsten steel are employed, a group of three on each side, and two sets connected by laminated iron pole pieces to form a double horseshoe lying horizontally.

The inductor moves in the center of this arrangement, disturbing the magnetic field sufficiently to bend or wave the lines of force that cut the primary windings around the connecting pole pieces which link the two groups of bar magnets. The breaker and the distributor are mounted on top of the magneto, above the vertical shaft of the

spark is obtained by partially revolving the whole magneto horizontally, the entire circumference of the circle being available, and the spark at all times is at the peak of the wave and consequently at its greatest efficiency. A very full spark at low speed is made possible, without an unduly heavy discharge at high speed.

Of the other new products to be shown the greater proportion are in the nature of parts, including motors, differentials, carburetters, radiators and the like. Several types of Long's radiators are staged, these

being made in Chicago by the Long Mfg. Co. Although in the types intended for touring cars and cabs a cellular appearance is given, the tubes are vertical, thin rectangular section, and have but one seam, which is at the rear of the radiator. The intermediate horizontal fins serve merely for extended radiating surface. The company also shows "spiral tube" radiators, of a construction to take the intense strain and vibration which are met with on commercial vehicles, where it is necessary to have a radiator more flexible and durable than is used on the ordinary pleasure car, where such stresses do not obtain.

"Anything in brass" is the slogan associated with the offerings of the Turner Brass Works, of Sycamore, Ill., which include the Harroun bumper, robe rails, tire holders, small pipe couplings, a double action tire pump, bronze radiator signs, soldering furnaces, blow torches, tank gauges and mufflers.

A new type of Continental motor is disclosed by the Continental Motor Mfg. Co., of Muskegon, Mich. It is of 44 horsepower, by A. L. A. M. rating, and is designed for high duty service on large cars and on trucks. Differing from all the other types of Continentals, the motor has T-head cylinders. Equipment is provided for dual ignition and the motor complete with magnetos weighs but 750 pounds. Numerous other types are shown, including one made to Chalmers specifications.

Close-coupled, condensed lens headlights and "rotary action" wind shields are presented by the Overland Sales Co., Chicago, Ill. The concern is not related in any way to the interests who make the Overland car, but is a distributor for Hopewell tire jackets, for the Detroit Steering Wheel & Wind Shield Co.'s products; Finderson & Kropf Mfg. Co., horns, robe rails and foot rests; Fowler Lamp Co., electric lamps; Shawber & Co., jacks; Milwaukee Auto Engine & Supply Co., timers; Vivax storage batteries, and the Chicago Lamp Co.

Several neat forms of automobile tops are displayed by the Gates-Osborn Mfg. Co., of Marshalltown, Iowa, a new concern, which has been running only a few months, but which purposes to capture a portion of the western trade.

Pat Hussey is by all odds the "piece de resistance" in the space occupied by Fulton & Zinke, who since Hussey's joining their forces are known as the F-Z-H Auto Parts Co., of Chicago, his initial completing the hyphenated trio. As a background, he has Falls motors, Lockport radiators, Victor lamps, Hussey lamp brackets, the Cotta transmission and other lines of similar character for which the company acts as distributor.

By the addition of a second adjusting device the Universal tire protector or removable tire tread, made by the Universal Tire Protector Co., of Angola, Ind., has been further improved and perfected and is non-detachable by service strain. The com-

pany also shows the Universal emergency tire sleeve, of the armored type and equipped with a quick acting anchorage device.

Originality of design is revealed in the "A. H." differential, put out by the Ross Gear & Tool Co., of Lafayette, Ind. The principal feature of the construction is the web shape of the housing, the body being a single casting. Pinions are dropped into pockets and short pins put through and interlocked by means of bolts which hold the assembly. The only stress on the pins carrying the differential pinions is that imposed by the pinions themselves, and it is equally distributed on both ends of the pins. The pinions turn on bronze bushings, instead of on the hardened pins. The differential is not split in the middle and there is only one joint between the driving wheel and the pins which drive the pinions. A new steering gear has been brought out from the same source for use on medium touring cars and light commercial vehicles, while no material alterations have been made in the time-tried types for 3 and 5 ton trucks.

Fertile in carburettor ingenuity, the Holley Brothers Co., of Detroit, Mich., puts on view a new type, having double jet and individual adjustment for the jets. The central or primary jet is purposely made of such small capacity that at increasing speeds it tends to "run lean" instead of increasingly rich. An augmentation of the suction, however, pulls open an auxiliary valve and throws the second jet into action. Variations in spring action do not affect the quality of the mixture, it is said, because the auxiliary handles a mixture, not a component of a mixture. There is also shown a means for "dashboard adjustment," to suit changes in atmospheric conditions, such as rain, fog or snow, which should be of considerable advantage to the all-weather tourist.

Telescoping stay rods, with thumb-nut pinch screw to lock, provide a large folding range to the tension type wind shield staged by the Twentieth Century Motor Car Supply Co., of South Bend, Ind. The shield can be placed at almost any angle or may be folded over the hood. Another shield, quite novel in construction, is intended for "torpedo" cars. It has but one sash, may be set at any angle, and will fold over the dash.

Combining demountable and quick detachable features, the Security demountable rim is brought out by the Security Demountable Rim Co., of Chicago, Ill., a twin of the Triple Action Spring Co. Five studs run through the felloe, and on them are as many eccentric discs which have flattened surfaces on the side furthest from the center of rotation. The rim and band are tapered toward the back and front of the wheel, respectively, and when turned into locking position the discs engage an in-turned locking flange on the inside of the rim, at the same time seating in the bot-

tom or groove of which the flange forms one side. The slight springing of the rim which is involved in turning the discs off the flats and around to release position is depended upon to clear of rust the joint between the rim and band. Creeping is prevented by two dowel pins, one on either side of the valve. No special valve is required, and either clincher or Q. D. tires may be used.

Transmissions and side levers constitute the chief display of the Auto Parts Mfg. Co., of Muncie, Ind., while the Fellwock Auto & Mfg. Co., of Evansville, Ind., and the Chicago Wind Shield Co., of Chicago, have shields in a plentitude of models. S. Breakstone, the Chicago agent for the Hagstrom Bros. Mfg. Co., of Lindsay, Kan., gives representation to Hagstrom inside tire sleeves and spark plugs.

Of exhibitors who, although previously appearing at New York, waited for Chicago to spring a surprise, the Atwater Kent Mfg. Works, of Philadelphia, is a more or less lonely example, its new offering being the Monoplex electric horn, operating on the vibrator principle. The "old stagers," however, make a phalanx of familiar names and goods which is very impressive. The tires include among others the Diamond, Morgan & Wright, Hartford, Michelin, G & J, Continental, Goodyear, Ajax, Firestone, Empire, Federal and Thermoid, while the tire specialties are represented by Fox chains, Woodworth treads, Gilbert tire jackets, Shaler vulcanizers, Weed chains and a long list of similar products.

In the ignition field the Remy, Heinze, Eisemann, Splitdorf, Connecticut and Mosler devices are conspicuous, while Solar and Gray & Davis lamps lend their strength to the lighting equipment display. The parts and materials are strongly in evidence, the list comprising such offerings as Cramp castings, A. O. Smith parts, Standard Roller Bearing axles, Warner Gear Co. gears and components, Excelsior motors, Hayes radiators and fittings, Muncie equipment, Raybestos, Raymond brakes, Thermoid, Warner Mfg. Co. transmission gears, Timken bearings and axles, and a volume from lesser known makers. Warner, Jones and Stewart & Clark lead the speedometer contingent, while Klaxon horns, Truffault-Hartford Shock absorbers, Gabriel horns, Foster shock absorbers, Bowser tanks, Jericho horns, Sager springs, Peerless shock absorbers and similar devices also make their appeal more directly to owner than to car manufacturers.

The list of exhibitors and their products is as follows:

#### AUTOMOBILES. Gasoline Pleasure Cars.

**DRAGON TAKES TO MOTORING**

**San Francisco Brand of Celestial Monster Travels Studebaker Style—Something About His Anatomy.**

Even the extremely conservative Chinaman realizes that an automobile may be useful in more ways than one. For centuries past it has been the custom of the Chinese—whether in their own country or in foreign lands—to hold a great procession on New Year's Day in which a huge dragon, borne on the shoulders of hundreds of men played the star part. The Chinese of San Francisco came to the conclusion that au-

SAN FRANCISCO'S "DRAGON," WITH STUDEBAKER POWER PLANT

tomobiles could carry the unwieldy monster much easier than they themselves, and the picture shows the way they fixed up the "motor-dragon." Three Studebaker cars bore the main body, while head and tail projected beyond the cars. A fourth car was used as a pilot through the crowded streets of the Chinese quarter.

For more than four hours the engines of the three machines were kept running, and on account of the slow speed at which they were compelled to travel, and the number of hills they were obliged to negotiate, all driving was done on the lower gears.

It was an ingenious coupling of the three Studebaker cars that were used that made the feat possible. This was accomplished by clamping pieces of 2 by 3 inch oak to the front and rear springs of the cars and coupling these from the center with a third of the same length, leaving about an eight inch play between the machines. Racks were then provided for the poles which supported the monster dragon, these being placed immediately in front of the radiators in the tonneaus of the cars and at the rear of the last car.

While the equipping of the three Studebakers for the feat called for considerable engineering skill, the driving of the auto-

mobiles was an exceedingly trying ordeal to the men at the wheels. Despite the fact that the cars were coupled together the drivers were obliged so to operate their engines that there was an equal amount of power exerted by them all.

**St. Louis Show Its Biggest Ever.**

With 74 exhibitors, 61 of whom will display motor cars and the remaining "lucky 13" (lucky that they got in) providing the fixings that go to make the car complete, the curtain will rise on the fourth annual show of the St. Louis (Mo.) Automobile Manufacturers and Dealers, in the First Regiment Armory, on Monday next, 14th inst., and will continue until Saturday, the 19th, when the order to break camp will

be given. Already certain to be twice as large as last year's function, the show promises to be the largest and best that ever has been given west of the Mississippi, and to that end arrangements have been made for a special train of 30 cars to transport a large number of exhibits at the Chicago show to "the Mound City" complete, at the conclusion of the big national show this week. Over \$2,000 will be expended in the decorations.

**Fusion Wins One Show for Rochester.**

Instead of having two rival shows as was the case last year, there will be but one in Rochester, N. Y., this year, this harmonious state of affairs having been brought about through the rounding up of the dealers into one association. The show, which will be the third annual motor exposition for the Kodak City, will be held in Convention Hall during the week of February 14-19, inclusive. The coming show promises to exceed both of last year's affairs, over 150 exhibitors already being listed. In an effort to eclipse all previous efforts in the decorative line the show committee has secured the decorations used at the Grand Central Palace show in New York City last month, and also has seen to it that there will be no lack of music.

**HARTFORD GETS COLONIAL SHOW**

**Big Veranda Surrounding Foot Guard Hall to Give the Effect—New Arrangement Gains Floor Space.**

In keeping with the prominent position of the city as one of the oldest and foremost New England towns and rich in colonial history, the show committee of the Hartford (Conn.) Automobile Dealers Association, consisting of F. W. Dart, E. G. Biddle and W. L. Ledger, instead of scouring Japan or Africa for decorative ideas, has selected a New England setting for the third annual show, which will open in Foot Guard Hall on the 14th and close on the 19th. Departing entirely from the decorative scheme employed last year, the arrangement of the coming exhibition will be such as to lead the visitor to imagine that he is entering an old colonial residence, and to heighten this effect the prevailing colors will be white and red. Over the stage a balcony will be built which will be supported in the center by two white pillars and on this elevated platform the band will be stationed. Red burlap stretched on frames and cut in panels by white strips at intervals will be stretched around the side walls, and the decorative treatment of the walls both underneath and above the balcony will be the same.

The balcony will be so arranged as to give the appearance of a big veranda extending around the entire hall. In the lighting scheme over 41,000 lights will be used, and the feature of the illuminations will be a giant electric star placed in the center of the ceiling and flanked by two large chandeliers. There will be no side aisles this year, but the central aisle will be twice as wide as formerly and will lead directly to the stage, where steps will be placed so that the cars displayed there may be inspected. In abolishing the side aisles the committee gained over 700 square feet of additional floor space for exhibition purposes. On the side of the aisles large white posts seven feet high will be surmounted with boards with the names of the cars in red old English letters. From the signposts to the side walls smaller posts, also in white will extend, connected by ribbons, and these will serve to separate the spaces.

**Buffalo to Have Only One Show.**

Although both organizations previously had arranged to hold shows of their own, the Automobile Club of Buffalo and the Buffalo Automobile Trade Association have agreed to combine their forces, and there will be but one show in the Bison City this winter. It will be held in the old Broadway Arsenal, February 14-19, under the joint auspices of both organizations.

## THINGS GO WRONG AT NEW ORLEANS

**De Palma, Oldfield and Robertson Encounter a Hoodoo—Honors Alternate in Two Days of Tame Racing.**

Something seemed to go wrong with the Mardi Gras automobile carnival in New Orleans, La., Saturday and Sunday last, February 5th and 6th, for it was not nearly so successful a meet as was held at the same time last year. The promoters apparently worked under a hoodoo from the start, for on the first day—by far the better sport day of the two—the racing was not extraordinary, although it did give the 5,000 spectators some few thrills.

On Sunday, the second day, an aeroplane flight by Louis Paulhan proved a drawing counter attraction, for only 3,000 people went to the fair grounds track to see the automobile races and those who did probably wished afterward that they had taken in the aeroplane flight. There were 25,000 people at the aviation field.

The first day's program consisted of six events, and in none of them were the finishes of the sort to make a crowd frenzied with excitement. The track was lumpy and dusty, this despite a generous application of oil, and in consequence no fast times were recorded. In fact, the fastest mile of the day was clocked in 53 seconds, Oldfield getting the credit. Ralph De Palma and his big Fiat racer took the lion's share of honors, winning the first five miles free-for-all from Ben Kirscher, in a Darracq, and a 10 miles free-for-all handicap. Oldfield naturally defeated his stable mate, Kirscher, in a special match race and he also won a 25 miles race for stock cars. Only one accident occurred and that resulted fortunately. Leigh Lynch, driving a Jackson car in the 25 miles stock car event, essayed a Barney Oldfield through the fence at the three-quarters turn in the 14th mile. The front wheel broke and precipitated the driver and his mechanic into the infield, but the only damage was the soiling of their clothes.

George Robertson, one of the best all-around drivers in America, was figured upon as a likely contender—a crack well able to cope with Oldfield, Kirscher and De Palma, but a mishap made the smiling George betake himself to the grandstand and watch his confreres cavort. On Saturday while warming his car into tune Robertson broke his crank shaft, and although a score of men worked far into the night in an effort to get the car working in time for Sunday's meet the other drivers went to the post without Robertson. Most of the cars developed hookworm on Sunday. This day more generally is regarded as a day of rest in the South than in the North, and it may have been that the mechanical steeds considered it proper to observe the Sabbath. At any rate there were only five

races, and these proved uninteresting. Robertson's car could not be gotten ready in time and De Palma removed his presence from the track after a burst tire in the feature race of the day. Only four races were held.

### First Day—Saturday.

The racing started with a 20 miles event for stock chassis of between 301 and 450 cubic inches piston displacement. Fulton, in a Packard, took the lead at the start and held it for a few miles, with Leigh Lynch, Jackson, crowding him hard. Fritsch, Buick, maintained a good pace, as did Delaney, Jackson, for a time, but the latter fell back toward the finish. Lynch won without looking around.

Three starters lined up for the five miles free-for-all. Oldfield led to the pole, but quit at the three-quarter pole, claiming he could not change his gears into the high. De Palma was only a few lengths behind and he merely had a little romp to keep in front of Kirscher, leading him home by an eighth mile in 4:41.

The ten miles amateur for the McCane trophy brought out C. S. Bragg in a Fiat. S. L. Speer in a Jackson, Fritsch in a Buick, M. P. Irwin in a Thomas, and George Clarke at the wheel of a Jackson. Clarke was protested at the start upon the grounds of professionalism and withdrew after being questioned by the referee. Irwin dropped out soon after the start. Bragg won by a half mile or more over Fritsch, but was protested, it being claimed his car was a specially built racer. The prize was held up pending an investigation. Time, 10:36.

Oldfield, this time in a Knox, De Palma and Kirscher lined up for the ten miles handicap, the first named getting 25 seconds and Kirscher 10 seconds start over De Palma. Oldfield blazed the way for eight miles until De Palma decided it was time to make his bid for the lead, and when he finally advanced the spark to the limit it was all over but the shouting. The time was 9:49.

Oldfield made a monkey of Kirscher in their five miles "challenge" race, but as he is being paid to play the role, did not seem to mind when Oldfield breezed home a half lap in advance. The New Orleans Sweepstakes for stock cars went to Oldfield in a Knox, the barnstormer finishing 1¼ miles in front of Fritsch. The summaries:

Twenty miles for stock chassis, 301 to 450 cubic inches—Won by Leigh Lynch, Jackson; second, Fulton, Packard; third, Fritsch, Buick. Time, 21:41.

Five miles free-for-all—Won by Ralph De Palma, Fiat; second, Ben Kirscher, Darracq. Time, 4:41. Also ran—Barney Oldfield.

Ten miles amateur, stock cars—Won by S. C. Bragg, Fiat; second, Fritsch, Buick. Time, 10:36.

Ten miles handicap, free-for-all—Won by Ralph De Palma, Fiat (scratch). Time, 9:49.

Twenty-five miles New Orleans Sweepstakes, stock cars—Won by Barney Oldfield, Knox; second, Fritsch, Buick. Time, 26:43.

Five miles match—Won by Barney Oldfield, Benz; second, Ben Kirscher, Darracq. Time, 4:33½.

### Second Day—Sunday.

Sunday's races were disappointing because of the small fields of starters and the lack of events. Only four races were run, the first crack out of the box being a five miles amateur scramble for the Klaw & Erlanger trophy. Fred Shaw, in a Knox, received 15 seconds handicap over Bragg. Fiat, the honor-marker, but he would have won without the allowance. Jack D'Arcy, Stoddard-Dayton, received 45 seconds and finished third, and M. P. Irwin, in a Thomas car, trailed in fourth.

Because no starters appeared for the A. A. stock chassis race that event was scratched and the five miles for the Gentilly Automobile Co.'s trophy also was not run. M. P. Irwin, Thomas, acquired a beautiful trophy rather easily as it was awarded to him by default, when no other drivers appeared at the starting line.

What promised to be the best race of the afternoon was a ten miles match between Oldfield and De Palma. The latter held the lead for a time, but was passed by Oldfield in the second mile. De Palma was gaining ground rapidly when he blew up a front tire and Oldfield walked in alone in 9:26.

The 10 miles free-for-all-handicap brought out Kirscher, Oldfield and De Palma. Oldfield switched to his Knox for 32 seconds handicap, while Kirscher got a lead of 15 seconds over De Palma. The last named made a pretty race, but was never quite able to overcome the long marks, Kirscher winning from Oldfield in 9:32. In another 10 miles race between Oldfield and De Palma, the former was allowed 28 seconds handicap. De Palma made a pretty race and gained three-quarters of the distance at the eighth mile, when another tire brought him to a halt and Oldfield enjoyed another walkover. The summaries:

Ten miles handicap match—Won by Barney Oldfield, Knox (0:28). Time, 9:47. De Palma, Fiat (scratch) burst tire in 8th mile.

Ten miles free-for-all handicap—Won by Ben Kirscher, Darracq (15); second, Barney Oldfield, Knox (0:32); third, Ralph De Palma, Fiat, (scratch). Time, 9:32.

Ten miles match—Won by Barney Oldfield, Benz. Time, 9:26. Ralph De Palma, Fiat, burst tire.

Five miles for Gentilly trophy—Walkover for M. P. Irwin, Thomas, no other entrants appearing.

Five miles amateur handicap, for Klaw & Erlanger trophy—Won by Fred Shaw, Knox (0:15); second, C. S. Bragg, Fiat (scratch); third, Jack D'Arcy, Stoddard-Dayton (0:45). Time, 5:05.

## FORTUNE FAVORS THE THIRTEEN

Perfect Scores for "Unlucky Number" in Rochester Club's Contest—Five More Suffer Small Penalties.

After two days of battling with snow drifts over 175 miles of roads, and encountering a toy blizzard on the second day, 13 of the 20 cars which started in the second annual mid-winter endurance run of the Rochester (N. Y.) Automobile Club to Syracuse and return on Wednesday, 3d inst., returned to the "Salt City" on the 4th with perfect scores. Five other survivors fell from grace on very slight grounds, their penalties being allotted for stalled motors or spark plug trouble, while two contesting cars dropped out on the second day. Owing to the prospects of a strenuous trip there were a couple of entrants who around starting time decided to stay at home, but the others who had signed up stuck to their guns, or rather wheels.

Checking out from the club's headquarters at the Hotel Seneca at one minute intervals, the cars rolled out of Rochester early in the morning under favorable weather conditions, and prepared for a hard struggle with the roads. The morning run to Clyde, where a stop for lunch was made, was uneventful, but in the afternoon the contestants had their troubles. Huge snow drifts were encountered and it often was necessary to take to the fields in order to get around them. The big Palmer-Singer pacemaker, with Bert Van Tuyle up, did yeoman service bucking the drifts, and its good work was much appreciated by the competitors. Despite the weather the tourists received ovations from farmers and townspeople all along the route, who in many places turned out several hundred strong to cheer the motorists. All of the cars reported at Syracuse the first night and there was not a great gap between the arrival of the advance guard and the tail ends. That night the visitors were entertained at a smoker.

For the homeward run a different route was chosen, and the cars pulled out from Syracuse at one minute intervals after 9 o'clock, with Geneva designated as the halting place for satisfying the wants of the inner man. The going was fair until the outskirts of Auburn were reached, when a pesky little four foot snow drift at the brow of a hill brought out shovels, and those in the advance brigade fell to with a will, dismantling the pile of "the beautiful" in a way that would have made a Panama canal steam shovel turn rusty with envy. A steadily rising wind caused the snow to bank solidly and the going became heavier. In nearing Geneva more drifts were encountered and the shovels again were brought forth. Better roads were en-

countered after leaving Geneva and good time was made on the last section of the run. One of the humorous incidents in connection with the contest occurred at the finish line on the second day, when after maintaining a perfect score up to that time one of the contestants stalled his engine while waiting to check in and was transferred to the penalized division.

The drivers and cars with perfect scores follow:

J. W. Gillis, Chalmers; Edward Martin, Cadillac; Fred Rockelman, Ford; John Harrigan, Selden; F. W. Peck, E-M-F.; John Burns, Franklin; Charles Kellman, Cunningham; Carl Holton, Cunningham; George Bower, Maxwell; Ray Hollis, Pullman; John Ward, Chalmers; Richard Geyer, Oakland; H. A. Strickland, Chalmers.

### Twin City Club Elects Officers.

Reuben Warner, thrice president of the St. Paul Automobile Club, was elected president of the Minnesota Automobile Association at the annual meeting held in St. Paul last week. The other officers chosen were as follows: Dr. J. A. Gates, Kenyon, first vice-president; J. H. Hiheldaffer, Minneapolis, second vice-president; L. A. Wood, St. Paul, secretary and treasurer. During the past year the association's club membership increased from 8 to 26, and five other clubs' applications are pending. The secretary's report showed an increase in active membership of affiliated clubs from 1,350 to more than 1,800. The treasurer reported a balance of \$848.33, and it was voted to expend \$500 in erecting signboards, in conjunction with such clubs as appropriate an equal amount for carrying on the work. The association went on record in favor of jail penalties for reckless driving, and urged that all local speed regulations be amended to conform to the state law.

### Oregon Motorists Organize.

Permanent organization of the Oregon State Automobile Association was effected at Portland last week, and the following officers were elected: J. H. Albert, Salem, president; Lawrence Therkelsen, secretary, and W. O. Van Schuyver, treasurer; directors, the president, treasurer and G. W. Sanborn, Astoria. The objects of the organization are to promote contests, aid the good roads movement and secure favorable legislation.

### New Officers for St. Paul Club.

New officers for the ensuing year were elected by the St. Paul (Minn.) Automobile Club last week, as follows: William J. Murray, president; E. W. Bazille, first vice-president; J. R. Hickey, second vice-president; F. J. Ottis, third vice-president; Dr. A. E. Comstock, secretary; W. D. Gery, treasurer; directors, new, J. C. Nethaway, Daniel Bell, W. G. Carling; holdovers, Phil W. Herzog, and Rudolph Shiffmann.

## WHY RACING MEN ESCAPE ARREST

Skill and Caution Key to the Mystery—  
Fear of Publicity Plot May be Another Reason, Too.

Why it happens so rarely that well known racing drivers are arrested for exceeding the speed limit, is explained by a man well known in the automobile trade.

"The men who drive automobiles in races," he says, "also run machines in the streets, and I notice that only on rare occasions are any of these men arrested for exceeding the speed limit in the city here or in the country roundabout. In fact, I can recall just now the names of only two men who, a few days after races in which they drove their cars in first came afoul of the bicycle policemen and were taken in.

"It may be for a variety of reasons that so few of the many racing drivers ever get into trouble. The most important, I believe, is that these drivers have fine control of the cars they drive and moreover have a great deal of caution. There is no nickname that a racing automobile chauffeur dislikes more than that of daredevil.

"Aside from their control and caution, these drivers really don't go very fast in the streets. If they hit it up between blocks they always slow up at the crossings. Then, too, most of them get to be known to the police, who aren't really too eager to take in these men. They know the drivers really are expert and they are likely to let these fellows drive faster without hindrance than they would permit a man not known to them as thoroughly in control of his car.

"For another reason, too, the police are apt to go easy on these well known professional drivers. They don't want to fall for any advertising scheme that some automobile concern has cooked up. The police always fight shy of the arrests that appear to be frameups for advertising purposes.

"One bicycle policeman told me once that they always hesitated about taking in women exceeding the speed laws because sometimes it was merely a theatre device, and that they didn't time men making great speeds up hills because of the advertising value that could be given to a police report, say of the such and such car going 30 miles an hour up the so and so hill, when the policeman made an arrest."

### Syracuse A. C. Re-elects Officers.

All of the old officers were re-elected for the ensuing year at the annual meeting of the Automobile Club of Syracuse, N. Y., as follows: H. W. Smith, president; Howard P. Denison, first vice-president; C. M. Ryan, second vice-president; Forman Wilkinson, secretary and treasurer. The club now has over 400 members, all of whom are confirmed optimists.

### SELDEN DECREE EXPECTED SOON

**Contestants Strike a Bargain Over It—  
Ford Hires New Attorneys and Returns  
A. L. A. M. Fire—To Give Bonds.**

Although the judgment sustaining the Selden patent was rendered in the United States Circuit Court last September, no decree against the Ford Motor Co. and the other defendants has been entered as yet, but that this formality is not to be delayed very many days has become known. Various reasons have been assigned by outsiders as to why no decree has been entered, but that which has been indicated from sources closely in touch with the situation is the fact that while the case was won with the Electric Vehicle Co., of Hartford, Conn., as a complainant, that company since has been taken out of a receivership and reorganized as the Columbia Motor Car Co., necessitating a change in the court records which involves considerable red tape.

While it is possible that the Ford company and the other defendants might temporarily obstruct the entering of the decree, owing to the changes in name which are necessary, it is intimated that the defendants have driven something of a bargain with the Selden forces by agreeing not to interpose legal delays in the path of the decree, provided the complainants supply the defendants' new attorneys with three copies of the complete records of the proceedings and testimony in the case, these records amounting to many thousands of pages and meaning an expense of \$5,000 or more. Such an agreement is calculated to bring the entering of the decree close at hand.

Following the taking in of all the members of the now defunct American Motor Car Manufacturers Association with the exception of Ford, the Association of Licensed Automobile Manufacturers has begun to assume a public aggressiveness

against the "independent" or unlicensed makers, in the form of spreadeagle newspaper advertisements setting forth the desirability of buying cars licensed under the Selden patent, and listing the licensed makes. This aggressiveness is in turn being matched by activity of a like character on the part of the Ford Company, which in space the same size as the A. L. A. M. pronouncements, raps that "divine body," as it styles it, and declares the Selden patent "a freak among alleged inventions and worthless as a patent and worthless as a device." The Ford intention to appeal the case to the higher courts is reiterated.

Not the least significant feature of the Ford declaration, however, is the statement that arrangements have been made with a \$6,000,000 bonding company for the issuance of individual bonds to purchasers of Ford cars who desire this protection in addition to the pledges of the Ford company itself to hold its customers free of damages for infringement and to sacrifice its own \$6,000,000 of assets if necessary to do so.

For the further battle which the Ford company is to wage in the courts with the Selden camp, it has engaged new attorneys, who are among the leaders in the practice of patent law. Edmund S. Wetmore, of Wetmore & Jenner, and Livingston Gifford, of Gifford & Bull, both firms being in New York City, are the lawyers who hereafter will conduct the legal warfare for the Ford forces. Because of their eminent reputation in the field of patent litigation it is anticipated that when the Selden case is taken up on appeal, the contest will be notable in law circles for the vigor and ability with which it will be conducted.

### Petrel Petitioned into Bankruptcy.

Involuntary bankruptcy proceedings have been brought against the Petrel Motor Car Co., of Milwaukee, Wis., which for the past year has been making the Petrel car. The petitioning creditors include the Hess-Bright Mfg. Co., of Philadelphia; Herman Andrae Electrical Co., and Andrae & Sons, both of Milwaukee.

### "STANDARDIZED" RIMS REJECTED

**Tire Committee of the Licensed Association not Impressed with United Rim Plan—Latter's Future Uncertain.**

Despite the overcoming of difficulties which beset it in the past, the project for two standardized types of universal quick detachable rims, as advanced by the tire manufacturers composing the United Rim Co. is again in a bad way and may have to be abandoned. Although having arranged patent matters satisfactorily among its rival constituents and having provided for the actual manufacture of the agreed upon types, the United Rim Co. has met a serious reverse in the refusal of the Association of Licensed Automobile Manufacturers, through its tire committee, to recommend the rims to its members; as a result the latter will be wholly free to use whatever rims they individually may elect to use.

For about two years the standardized rim proposal has been making more or less progress, first in a compromise of various tire companies by which they yielded their respective patent rights to the United Rim Co., a patent holding company, and, second, in effecting an arrangement with two of the big rim making concerns to manufacture the standard or compromise types. As previously given in the Motor World, the companies in the United Rim movement for standard rims include the Diamond Rubber Co., the Goodyear Tire & Rubber Co., the B. F. Goodrich Co., and the Rubber Goods Mfg. Co.'s constituents, these latter being the Hartford Rubber Works Co., Morgan & Wright, and the G & J Tire Co.

At first the United Rim Co. accounted its work almost accomplished, when it had decided upon one type of rim which was a blend of the virtues of the rival rims of its members and which was to be offered as the selected standard type. When the mat-

ter of manufacturing the rim was taken up, however, the rim makers who were approached declined to accept the United Rim terms, which provided that the rim makers should make the new rim under license and cease making any other kind. It was contended by the rim makers that for them to give up the manufacture of all other rims in order to obtain the right to make the "standard" would involve a serious risk, inasmuch as the new rim might not be as successful as expected and other rims might greatly exceed it in demand.

A concession was finally made by the rim patents company, by the selection of a second "standard" rim in addition to the first one, thus giving two "standard" types. The rims were styled Universal Q. D. Type No. 1 and Universal Q. D. Type No. 2, respectively, and a manufacturing license was granted to the Standard Welding Co., of Cleveland, O., and the Weston-Mott Co., of Flint, Mich., these concerns agreeing to drop all other types and the Diamond Rubber Co. and the Rubber Goods constituents were to retire from the rim business, and all concerned were to endeavor to make the two rims truly standard.

In this endeavor representatives of the tire companies in the United Rim movement recently appeared before the tire committee of A. L. A. M. to urge that that organization officially recommend the standardized types to the Association membership and assist in the standardizing process. Unfortunately for the project, however, the Licensed tire committee could not be persuaded that the time is ripe as yet for "standardized" rim forms, and consequently the United Rim Co.'s progress in this direction has been abruptly stopped.

While the United Rim Co. cannot dissolve except by unanimous consent of the companies concerned in it, the blow that it has received makes its continued existence more or less uncertain. A meeting of the United Rim interests is to be held in Akron, O., tomorrow (Friday) to consider the future of the movement for standardization.

#### The Men Who Will Lead the Lion.

The Lion Motor Car Co., of Adrian, Mich., whose new product, the Lion car, was staged at the Chicago show, has elected its officers for the coming year. Henry Bowen is president and general manager; Leslie B. Robertson, secretary; Austin E. Morey, treasurer, and W. H. Shierson, assistant. The car was designed by C. H. Blomstrom, well known in Detroit manufacturing circles.

#### Barnes to Manage the Anhut Factory.

H. C. Barnes, who has been superintendent of the Overland plant at Indianapolis, Ind., has severed his Overland connection to go to Detroit, Mich. He has become the factory manager for the Anhut Motor Car Co., making the Anhut Six.

## E-M-F DECLINES MERGER PROPOSALS

**Will not Join the United Motors Project—  
Nor Will There be Reconciliation with  
the Studebakers.**

Because of a mysterious pilgrimage to New York City made by officials of the E-M-F. Co., of Detroit, Mich., last week, reports were set afloat that the company either was concluding negotiations to become a part of the \$16,000,000 United States Motor project or was arranging to resume affiliations with the Studebaker interests for the distribution of the E-M-F. product. Both reports, it transpires, had some basis of fact, but were extreme and erroneous in their conclusions.

Upon returning to Detroit after several days spent in New York, accompanied by others of the company, President Walter E. Flanders issued a statement indicating that whatever prospects there may have been for the E-M-F. company to join in a merger of any kind have been dismissed. It was known that negotiations have been very active since the time of the Palace show, but, according to Flanders, the offer which was made to him and his associates has not been accepted.

"An offer was made to combine the E-M-F. company with another organization and continue me in charge of the E-M-F. plant," said Flanders, "but my associates and myself have decided to reject the offers. No further negotiations are pending. The Detroit owners are in absolute control of the E-M-F. plants. Every contract we have made with dealers and agents will be carried out, but no contracts made by the Studebaker company for the sale of our cars will be followed."

It was admitted by another officer of the company that officials of the E-M-F. and the Studebaker companies had been in conference relative to their legal differences. That the conference by no means portended a reconciliation between the two companies and a resumption of their former relations, however, was made plain by President Flanders' language.

"We would have nothing to gain by a compromise or reconciliation," he declared. "There are not now, nor have there been at any time, any negotiations between us with a view to effecting either reconciliation or compromise."

#### Details of New Pullman Factory.

The Pullman Motor Car Co., which, in addition to its plant at York, Pa., is establishing a factory at Evansville, Ind., has disclosed some of the details of the latter enterprise. The company is to have about 50 acres of ground, on which there will be a factory with 200,000 square feet of floor space, mostly on one floor, and a testing track a mile in extent. The plant will have

its own drop forge and pressed steel equipment, together with foundries of all kinds, and will be able to handle almost everything contained in the cars from the raw material up. Increases also are being made in the factory at York, where the company is making its own engines, transmissions, steering gears, bodies, tops and other parts. To supplement the 110,000 square feet of floor space at present available, two additional buildings have been leased, and also a plot of ground 50x250 feet. On the latter it is intended to put up an additional machine shop and a building for assembling and testing purposes.

#### White Star Falls Into New Hands.

Proposing to swallow the White Star Automobile Co., of Atlanta, Ga., which has developed a car assembled from standard parts, and to "grow bigger," a new company has been organized in the same city, to be known as the Atlanta Motor Car Co. The concern, which is incorporated with \$100,000 capital, has chosen the following officers: Clarence Houston, Atlanta, president; N. P. Moss, Lafayette, La., vice-president and treasurer; W. Mills, Detroit, Mich., secretary and assistant treasurer; Fred L. Sawyer, Americus, Ga., general manager. A tract of land has been bought at Marietta street and Ponders avenue for a factory.

#### Two Old Diamond Men Get Branches.

Succeeding G. J. Bradley as manager of the Detroit and Cleveland branches of the Diamond Rubber Co., respectively, James Q. Goudie has been appointed as the Detroit manager and C. B. Myer as the Cleveland manager. Goudie, whose home is in Detroit, has been with the Diamond company for about a year, first as assistant manager of the operating division at Akron, O., and later as manager, while Myer for some time has been the assistant manager at the Cleveland branch.

#### Whistler and Wyandotte Come to Terms.

For the manufacture of Magnetos a factory is to be built in Wyandotte, Mich., by the Whistler Mfg. Co., which has been negotiating with the citizens of that place for some weeks and which has come to terms with them. The plant will be located at Mulberry and Third streets, the agreement being that it will pay a minimum of \$50,000 per year in wages. It will be supplied with power current at minimum cost and will be exempt from taxes for five years.

#### M. A. M. Elects Six New Members.

The Motor and Accessory Manufacturers, at its meeting in Chicago during the week of the show, added six companies to its membership. The accessions are Briggs & Stratton Co., Milwaukee, Wis.; Livingston Radiator & Mfg. Co., New York City; Cleveland Speed Indicator Vo., Cleveland, O.; Parish Mfg. Co., Reading, Pa.; Lavigne Mfg. Co., Detroit, Mich.; B. F. Everitt Co., Detroit, Mich.

## LARGE ROW OVER A SMALL PART

Repairman Disputes the Price and is Taken to Court—Loses Case and Costs Pile Up.

Unreasonable refusals to pay for automobile replacement parts, on the ground that the price asked is too much, evidently do not meet with sympathetic consideration in the courts, at least not in the city court of Hartford, Conn., where R. M. Clough, who has a machine shop in Tolland, Conn., was called upon to explain why he did not pay a bill of \$12 to the Palace Automobile Co., of Hartford. The suit arose over a gear housing which Clough had received through the Palace company.

While Clough admitted that he had received the part, he declined to pay for it, on the ground that the price was "excessively outrageous." It transpired that when the car gave out, Clough ordered from the manufacturer in Hartford an axle part, which was sent to him and billed at \$3.25. Upon receiving it he discovered that it was not what he wanted and it was returned. Through the Palace company he obtained the proper repair part, which was billed to him at the manufacturer's list price of \$12, with 25 cents additional for express. The cost of the housing to the Palace company was \$10. Clough, who acted as his own lawyer, said that if he had received the bill at the time he received the housing he would not have used the latter, considering the price exorbitant, and he maintained that a good business concern would have sent the bill at the time the goods were sent. His estimate placed the value of the part at about \$3.25—what he had been charged for the first piece.

Failing to supply the expert witnesses to prove the prices excessive, Clough's argument did not convince the court of the justice of his contention. Judgment was therefore given against him, not only for the \$12.25 representing the housing and the express charges, but also for \$11.66 in court costs.

### The Best Market of the Future.

"During the next five years the greatest sales of automobiles will be made in that area stretching between the copper country and the southern rim of the Texas panhandle," is the opinion of Charles T. Jeffery, who is the head of the Rambler sales organization.

### Licensed Dealers Elect Directors.

Formal organization of the Licensed Automobile Dealers Association, of New York, took place on the 10th inst., at a meeting held in the assembly room of the Automobile Club of America. The directors nominated at the previous meeting were elect-

ed, as follows: Carl H. Page, George W. Bennett, Gen. John T. Cutting, Harry Fossdick, C. P. Skinner, R. D. Garden, M. J. Budlong, S. B. Bowman, James Joyce and John F. Plummer. Representatives of 26 "licensed" agencies and branches were present.

### Rubber Again Begins to Rise.

After several months of fluctuation about lower levels, the price of crude rubber again advanced to and passed the \$2 mark early this week. As quoted in the New York market on Tuesday of this week, the price asked for the up-river fine quality was \$2.03, the highest since last October. Other grades have advanced proportionately. In general the rise in price is attributed to local conditions at the Brazilian shipping points, sales in New York and Liverpool being reported as light with manufacturers for the most part out of the market. The lowest price quoted since the first of the year was \$1.74½, which was reached about the middle of January. Since then the price has averaged around \$1.85.

### Cameron to Make Ball Bearings, Too.

Although still associated with the Cameron Car Co., of Beverly, Mass., F. F. Cameron has instituted a new enterprise in Hinsdale, N. H., to make ball bearings. It will be known as the F. F. Cameron Co. and has been organized with \$20,000 capitalization. The officers are W. N. Pike, president; F. F. Cameron, vice-president and general manager, and James O'Brien, secretary and treasurer. The company has leased the top floor of the mill building of the Orren C. Robertson Co.

### Anhut Interests in Truck Project.

With the backing of several of the men who are in the Anhut Motor Car Co., of Detroit, Mich., a new concern is being organized in Mount Clemens, Mich., to build commercial vehicles. It is to be called the Mount Clemens Auto Co., and present plans provide for a factory at Church street and Floral avenue, 60x300 feet, to be followed later by a larger structure on a five acre tract donated by local business men.

### Thomas Cab Acquires Separate Plant.

The Thomas Motor Cab Co., of Buffalo, N. Y., which has been conducting its manufacturing operations in factory space yielded to it by the E. R. Thomas Motor Co., is now occupying a separate factory of its own, at 1738 Elmwood avenue. The new plant is devoted entirely to the production of taximeter cabs.

### Pilot Finally Gets a Factory.

The Pilot Motor Car Co., which was formed in Richmond, Ind., about a year ago, has taken the building of the Kramer Mfg. Co., on North Tenth street, opposite the Pennsylvania station, for a factory. It is intended to build medium price cars.

## CHICAGO SHOW THE "BEST EVER"

Attendance was Record-Breaking, Even on "Dollar Day"—And the Sales Were "Away Up."

Measured in terms of actual business consummated on the spot, it is unquestionable that the Chicago show of last week was the most successful exhibition of the present season, and probably a record breaker in show history. The attendance surpassed that at any former Chicago show, not even the advanced prices of Thursday, which was "dollar day," serving to strip the aisles of the crowds which, as on other days, surged about the stands. Despite the supposedly settled condition of the wholesale market, a good share of agency business was reported, no less than 1,500 agents having registered at the Coliseum during the week.

It was in its aspect of being close to the people, however, that the show attained its most important proportions. A large percentage of the out-of-town visitors came prepared to buy, and where they did not invest in complete cars the accessory and supplies people felt the benefits of their presence in generous measure. One remarkable feature of the retail phase of the show was the quality of the cars in requisition. Whereas in former years the demand manifested during the week has been more for the cheaper grades of car, reports from authentic sources reveal the fact that at this time the prevailing requirement was for cars averaging around \$2,000 in price; while such makers as handle the higher priced products came away well satisfied both with the quality and quantity of business transacted.

To take one noteworthy example, Thomas B. Jeffery & Co. reports the sale of no less than 175 Rambler cars during the seven days of the show, making a total of \$350,000 of business to individual buyers. This is record volume for Rambler show business, if not a record for show sales by a single maker. Last year 160 Ramblers were disposed of during the week, the average price being \$1,900.

### Another Chance for Indiana Investors.

Invitations are to be extended to the public of Marion, Ind., to invest in the Marion Automobile & Mfg. Co., which has developed a buggy type machine that, as previously indicated, is to be called the "Marion Flyer," despite the fact that this designation already is applied to a car which has been on the market for several years. For a factory the concern has leased the Genung livery building at Third and Nebraska streets. The officers are John I. Rennaker, president; Charles Rennaker, vice-president, and Clifford G. Rust, secretary.

## IN THE RETAIL WORLD.

Bartlett & Frazier, Huntington, Ind., have dissolved partnership. W. M. Frazier will continue the business.

The Hockaday Motor Supply Co. has been formed in Wichita, Kan. It will do both a jobbing and a retail business.

The Bells Hardware & Implement Co., Bells, Tex., has "gone into" automobiles; it has secured the Ford agency.

Palmyra, N. Y., and P. Duehler & Son, Lyons, N. Y., also dealers in carriages, are about to make the same move.

Mantz & Reed, vehicle dealers in North English, Iowa, are about to add automobiles to their stock. H. O. Young Sons,

The Munger Automobile Co., Dallas, Tex., has opened a branch in Fort Worth. It is located at 9 Houston street and J. R. Bowers is in charge.

C. M. Barber has embarked in the automobile business in El Paso, Tex. He is handling the Babcock electric and Olds-Oakland lines.

The Windsor Garage Co., Cumberland, Md., has awarded the contract for an addition to its establishment. The firm is located in the rear of the Windsor Hotel.

Leon Rundell, of Dolgeville, N. Y., will build a garage in the spring. It will be 25x50 feet, and will be located on Slawson street, near South Main street.

The Mulkey Auto Co., of Fort Worth, Tex., has begun business in that place, with quarters at 1511 Houston street. It is handling the Maxwell line exclusively.

K. R. Montgomery, of Detroit, Mich., has gone into business in the Straits City, and will handle the American car. He will have quarters at 487 Woodward avenue.

John Poltera, of Coldwater, Kan., is now installed in a new concrete garage, 50x100, which includes a repair department. It will be local headquarters for the Moline line.

John Law, of Lebanon; Wells & Son, of Middleport, and the Logan Carriage Co., of Parkersburg, are three more of the Ohio vehicle dealers who have "taken on" automobiles.

Close Brothers, Schenectady, N. Y., who operate a garage on Smith street, were visited by fire last week. It quickly was extinguished, before any appreciable damage resulted.

The Bergers Automobile Co., of Omaha, Neb., is having built a new garage at Nineteenth and Farnam streets. Temporarily the concern is located at 312 South Eighth street.

W. S. Hathaway, Kansas City, Mo., who has the local Maxwell, Regal and Hupmobile agencies, has removed to 1612-14 Grand avenue; the new location is a few doors north of his old stand.

Clement Bailey, Woodsville, Vt., now is installed in his new garage; it is a brick structure, 50x50, with plate glass front. In

addition to handling Buick cars, he also deals in farm implements.

The White Garage & Sales Co., Dallas, Tex., has reorganized and changed its style to White Sales Co. Coincident with the change the concern has taken the agency for the E-M-F. and Flanders cars.

The Gordon Motor Co., Richmond, Va., has purchased a plot 137 feet front on West Broad street, between Harrison and Ryland streets, for garage purposes. The transfer involved the sum of \$27,200.

Henry House, of Houston, Tex., is awaiting completion of a new garage which is being built at the corner of Capitol avenue and Milam street. It is a two-story structure of brick and concrete and will cost \$12,000.

The Union Motor Car Co., East Orange, N. J., has removed to new quarters, at 304-308 Central avenue, which will be the home of Premier and Reo cars. The salesrooms are 22x70, and the garage space measures 50x100.

The Skowhegan (Me.) Garage Co., lessees, have taken possession of their new garage, erected for them on the Skowhegan Hotel property. W. H. Norton and F. I. Spinney are among those interested in the enterprise.

The Fiat Automobile Co. of Rhode Island is the style of a new concern which has opened up at 17 Dorrance street, Providence, to exploit the Italian car in southeastern New England. Jefferson K. Crafford and Frank R. Hunter are the leading spirits in the venture.

The Detroit-Cadillac Co., Newark, N. J., just have taken possession of their new establishment at 232 Halsey street, which is one of the handsomest motor car emporiums in the city. It is a one story structure, 25½x140 feet, built of brick with limestone trimmings and plate glass front.

The C. L. Taylor Auto Co., Kansas City, Mo., is extensively remodeling its quarters at 1616-18 Grand avenue, which it formerly shared with the Maxwell agency. When alterations are completed it will have one of the largest and most commodious establishments in the city.

A. H. Barber and J. D. Hunter, North Adams, Mass., prominent business men of that town, have dipped into the automobile business and will handle the Franklin the coming season. They, of course, will retain their connection with the Barber Leather Co., and the Hunter Machine Co., respectively.

The Peerless Garage and Sales Co., of Brooklyn, N. Y., has taken possession of its new building at 1523-1525 Bedford avenue, near Eastern parkway, which is one of the best in that city. In addition to spacious storage facilities, there is a complete repair department. Peerless and Mercer cars are handled.

The Adams Repair Co., of New York

City, which in its business of rebuilding and repairing automobiles had attained to liabilities of \$43,371 before being put into bankruptcy, has effected a compromise with its creditors. The latter will receive 20 cents on the dollar, Judge Holt having confirmed the composition.

A new building which will be shared jointly by the Rambler and Kisselkar is in process of erection at Fifteenth and Harrison streets, Kansas City, Mo., and soon will be ready for occupancy. John Naye, with the Rambler, will occupy the west half of the double front emporium, and C. A. Post will have the corner store with the Kisselkar.

The Auto Supply & Tire Co., Wichita, Kan., has been organized to take over the business of the Auto Tire Co., located at 143 North Market street. The change of name was found desirable because of the addition of motor car supplies to the firm's line, but involves no change in management, C. A. Hagberg and O. D. Johnson continuing as proprietors.

The Troy (N. Y.) Garage, a new establishment in the Collar City, has acquired the Palace livery stable on Third street, and will occupy it when alterations are completed, which is expected to be early in February. It will have facilities for repairing. The members of the new firm are: Roy V. Rhodes, A. E. Mambert, Pierce H. Russell and W. A. Thomas.

The Franklin branch in Kansas City, Mo., is to have a new home which will be among the most pretentious establishments in the local colony. A plot 177x160 has been purchased at Thirty-fourth and Main streets, on which a two story building with basement will be erected; it will be modern throughout and in architecture will be in keeping with the handsome residences of the aristocratic neighborhood.

The Locomobile Co. of America's Chicago branch, formerly located at Michigan avenue and Fourth street, now is installed in a new three story brick and concrete building fronting on the same thoroughfare at Twenty-first street. It has the distinction of being the first motor car sales branch to be established in the Windy City, and until the present migration had never changed from its original location.

Two new garages have been opened in New Haven, Conn., which add considerably to the Elm City's facilities in this line. W. T. Dill, one of the pioneer dealers, just has thrown away the key of his new garage in Crown street, between Park and Howe streets. It is situated in the residential district, and has accommodations for a large number of cars, in addition to a well-equipped repair shop. Wheeler & Wuestefeld are the proprietors of the other establishment, a handsome structure which is said to be one of the largest garages in New England and is completely equipped in all departments. Stoddard-Dayton and Regal cars are handled.

**The Week's Incorporations.**

Pittsburg, Pa.—Pittsburg Motor Car Co., under Pennsylvania laws with \$5,000 capital.

Philadelphia, Pa.—Boulevard Garage Co., under Pennsylvania laws with \$10,000 capital.

Houston, Tex.—Ford Motor Co., under Texas laws, with \$2,000,000 capital; to do business in Texas.

Erie, Pa.—Erie Rubber Co., under Pennsylvania laws with \$25,000 capital. Corporators—W. H. H. Brown and others.

Philadelphia, Pa.—Lyman Tire & Rubber Co., under Pennsylvania laws with \$20,000 capital. Corporators—J. Walton Lyman and others.

Houston, Tex.—Houston Taxicab Co., under Texas laws with \$10,000 capital. Corporators—E. F. Dupree, B. S. Davison and D. F. Simmons.

Adams, Mass.—Tower Motor Co., under Massachusetts laws with \$25,000 capital; general automobile business. Corporators—C. H. Tower and others.

St. Paul, Minn.—Burney Bird Auto Co., under Minnesota laws; general automobile business. Corporators—Burney Bird, Louise Bird and Charles B. Warren.

Canton, Mass.—Compressed Gas Tank Co., under Massachusetts laws, with \$10,000 capital. Corporators—E. B. Smith, E. G. Biddle and H. W. Lester.

New York, N. Y.—Eggler Lubricator Co., under New York laws, with \$25,000 capital; to deal in lubricators, etc. Corporators—C. Meyers, E. Meyers and I. Cohen.

Bridgeport, Conn.—Motor Car Co. of Connecticut, The, under Connecticut laws with \$5,000 capital. Corporators—W. H. Lewis, Edward D. Beach and John V. Schenck.

Buffalo, N. Y.—Powell Motor Co., under New York laws with \$10,000 capital. Corporators—J. W. Powell, D. J. Churchill, G. Morton Wolfe, Earle R. Powell and Fred F. Dye.

Rochester, N. Y.—W. H. Rowerdink & Son under New York laws with \$100,000 capital; to manufacture motor vehicles, etc. Corporators—W. H., N., H. J., and M. W. Rowerdink.

Jersey City, N. J.—Blakeslee-Britten Co., under New Jersey laws with \$50,000 capital; to manufacture automobiles, etc. Corporators—G. E. Blakeslee, E. F. Britten, Jr., and E. E. Downs.

Rock Island, Ill.—Totten Auto Co., under Illinois laws, with \$10,000 capital; general automobile business. Corporators—M. L. Totten, Frank T. Lynch, Elbert G. Don and W. C. Totten.

Omaha, Neb.—Standard Auto Co., The, under Nebraska laws with \$75,000 capital; general automobile business. Corporators—H. E. Wilcox, H. H. MacDonald and Charles C. Merz.

New York, N. Y.—Fleischmann Vehicle Co., under New York laws with \$25,000 capital; to manufacture carriages, automobiles,

etc. Corporators—O. F. and R. H. Fleischmann, P. Damm.

Marion, Ind.—Marion Automobile & Mfg. Co., under Indiana laws with \$10,000 capital; to manufacture automobiles. Corporators—John I. Rennaker, Charles Rennaker and Clifford G. Rust.

Fairmont, W. Va.—Fairmont Automobile Co., under West Virginia laws, with \$5,000 capital; to deal in automobiles. Corporators—E. M. Showalter, H. F. Smith and H. D. Showalter.

Detroit, Mich.—True Blue Motor Co., under Michigan laws, with \$100,000 capital; to manufacture automobiles. Corporators—Maurice Wolf, Wallace E. Brown and Edmund H. Coombs.

Shelby County, Tenn.—Southern Automobile Co., under Tennessee laws with \$25,000 capital. Corporators—M. P. McLaughlin, H. J. Holmes, T. L. Regester, J. M. Williams and H. J. Hasenwinkle.

Bridgeport, Conn.—Rantz Motor Car Co., The, under Connecticut laws with \$25,000 capital; to manufacture automobile parts. Corporators—F. A. Rantz, George Langdon and Augustus Wood.

Augusta, Me.—L. A. W. Motors Co., under Maine laws with \$1,000,000 capital; to manufacture and deal in internal combustion engines, etc. Corporators—E. M. Leavitt, Winthrop, and others.

New Orleans, La.—Myatt-Dicks Co., under Louisiana laws, with \$50,000 capital; general automobile business. Corporators—George E. Dicks, D. O. Myatt, C. B. Dicks and T. J. Ferguson.

Nebraska City, Neb.—R. A. Duff Engineering Co., under Nebraska laws, with \$25,000 capital; to manufacture automobile parts. Corporators—R. A. Duff, Harry Wolfe and Clarence Armstrong.

Chicago, Ill.—Twentieth Century Auto Station, under Illinois laws, with \$2,500 capital; general automobile and garage business. Corporators—Cornelius J. Short, John A. Cameron and Benedict J. Short.

Aurora, Ill.—Downer Place Automobile Co., under Illinois laws with \$25,000 capital; general automobile and garage business. Corporators—Charles S. Battle, Irving Ochsenschlager and John L. Dickes.

Wichita, Kan.—Auto Supply & Tire Co., The, under Kansas laws with \$50,000 capital; to take over business of The Auto Tire Co.; to deal in automobile supplies. Corporators—C. A. Hagberg, O. D. Johnson and others.

Beatrice, Neb.—Jonz Auto Co., The, consolidated with Beatrice Lawn Mower Co., under Nebraska laws, with \$150,000 capital; to manufacture automobiles. Corporators—C. Charles Jones, W. C. Black, Jr., N. E. Jones and J. R. Quein.

Minneapolis, Minn.—Heaney Automobile Co., under Minnesota laws, with \$50,000 capital; to manufacture and deal in automobiles, etc. Corporators—A. P. Heaney, Olivia; J. M. Freeman, Olivia; R. H. Greer, Fairfax, and C. O. Jacks, Minneapolis.

**Michigan Six Gets Money and Plant.**

After exhibiting and creating interest in a six cylinder car for \$1,600, the Michigan Motor Co., Ltd., of Detroit, Mich., has arranged to locate in Rochester, Mich., in the buildings formerly occupied by the Ayres Gas Engine Co. The company is to be capitalized at \$100,000 and is to be assisted in some degree by the Business Men's Association, of Rochester. The promotion of the factory project was negotiated by H. O. Carter, of Detroit, treasurer of the concern.

**Two New Men with Stewart Indicators.**

Fred R. Hill, formerly with the New York office of the Warner Instrument Co., and Harry Weber, formerly with Herz & Co., having joined the traveling force of the Stewart & Clark Mfg. Co., of Chicago, Ill., manufacturers of the Stewart speed indicators. Making his headquarters in Philadelphia, Hill will cover Pennsylvania and southern territory, while Weber will make his headquarters in Kansas City and cover all the Southwest.

**Monitor May Get Wisconsin Money.**

By taking a block of \$50,000 worth of stock in the Monitor Automobile Co., which at present is located in Chicago, the citizens of Janesville, Wis., are to induce the company to move to their city. A committee has been appointed to raise the necessary money, and arrangements are being made to give the company the use of a portion of the large warehouse of Green & Sons for a factory to manufacture motor trucks.

**Harrington Joins the Wise Firm.**

A. C. Harrington, who for the past nine years has been a Packard salesman in the Metropolis, has resigned to take charge of the sales department of S. J. Wise & Co., Fifty-fourth street and Broadway. The latter are the New York distributors for the American Simplex car.

**Arguing G & J-Michelin Patent Suit.**

The suit of the G & J Tire Co. vs. Michelin Tire Co. has been up for argument in the United States Circuit Court in New York City during the past three days. The suit is for alleged infringement of the G & J patents.

**Gabriel Selects a Sales Manager.**

C. H. Foster, of the Gabriel Horn Mfg. Co., of Cleveland, O., has given up the sales management of the business in order to devote more time and attention to the manufacturing end. H. D. Preston has been appointed sales manager.

**Mabley Now in Ball Bearings.**

Carlton R. Mabley, formerly identified with automobile importing interests, has become general manager of the R. I. V. Co., of New York City. The concern handles ball bearings.

# The White Gasolene Car

## is equipped with a Four-Speed Transmission

Do not be satisfied with anything less than a four-speed transmission. Sooner or later, it will entirely supplant the three-speed transmission, just as the latter took the place of the two-speed transmission.

The four-speed transmission is used in practically all cars selling at \$4000 and over, but no other car selling at the White price—\$2,000—is thus equipped. The White is built with a four-speed transmission, because it makes it a better car than if only a three-speed transmission were used. This is typical of the QUALITY of every detail of the White car—for example, a “honeycomb” radiator is used, instead of the cheaper and less efficient tubular radiator; the frame is of crucible chrome-nickel steel, instead of the usual carbon steel; the leather in the upholstery is hand-buffed, instead of the cheaper and almost universally used machine-buffed leather; forty-two days are devoted to painting the car, instead of one-third or one-fourth of that time, etc., etc.

---

Write for a copy of our catalog, or, better yet, call on our nearest dealer, so that you may learn the many respects in which the construction of the White is better than ever before found in a car of moderate price.

---

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, FEBRUARY 17, 1910.

### Calmness While the Fever Rages.

During this era of high and still higher pressure and enormous production, perhaps nothing excited more comment in manufacturing circles than the announcement of a veteran manufacturer of relatively popular priced cars that for 1910 he would turn out only 2,500 cars; as his is a factory of large proportions, his production generally had been estimated at not less than double that number. The resulting remarks chiefly had to do with the "waste" that must ensue.

On the heels of this announcement another old and equally well known manufacturer, whose product sells for higher prices than the other one, tells the Motor World that he is preparing to about halve his output for 1911. This year he will produce 1,800 cars, next year he plans to build but 1,000. His productions generally are reckoned with the tiptoppers, but, good as they are, he means that they shall become

even better; it is his purpose to devote more time and greater pains to each respective vehicle. In effect, it is his purpose to build with an eye to the future rather than with the immediate present in view.

Despite any surprise that may be expressed because of this decision, it is a fact that there are manufacturers who never have permitted the feverishness of the times to enter either their souls or their hands, and, generally speaking, they have commanded high prices for their cars and their reputations now are enviable ones. When one of this class finds it desirable to advertise: "No piece-work; no overtime; no night work; no rush methods," the significance is plain.

The situation is one which well may give pause even to some of those capable of enormous production. While the average man is anxious to make as much money and to get rich as quickly as possible, even that interesting and usually exciting procedure has its disadvantages. There is a future to be reckoned with, and then to have more room and greater facilities than are possible to utilize means more waste and greater loss than now may seem possible. Recovery from a fever usually is a slow process and leaves the patient in a sadly weakened state.

### Concerning Carburetter Design.

While the field of carburetter design at present exhibits quite as much variety as ever it did, it would seem that in one sense at least automobile engineers are coming to a state of positive agreement with regard to the possibilities of carburetter construction. Whereas for a time it seemed that efforts at the production of new types were more in the way of random shots at a mark than well aimed attempts with a common object in view, it now appears that those who have "the heart of the engine" most plainly in their vision have been able to subdivide the general problem involved into two distinct elements, one of which, at least, has pretty nearly ceased to be troublesome.

Obviously it is the double purpose of the carburetter as at present employed, first, to vaporize the fuel, and, second, to give it the proper admixture of air to render it combustible to the degree of explosiveness. Small difficulty is now encountered in atomizing the fuel and thereby reducing it to a point where it can be evaporated

by simple contact with the atmospheric component of the mixture. But in adding that essential quantity of air, varying in proportion to the vapor with every change in operating conditions, no insignificant obstacle must be overcome. Perhaps in just and early recognition of the essential difficulty of the carburetter problem, Charles E. Duryea, the well known pioneer, was moved to term his own devices of this class a "mixer." At all events, it is in the process of mingling the air and gasoline vapor that the greatest divergence of present practice and the widest variety of applied theory is to be found.

In a general way, it would appear that carburetter designers during the past year or so have come to a tacit understanding on one essential point—namely, that it is extremely difficult, if not impossible, to regulate the air inlet by the aid of spring tension alone. In witness whereof may be instanced the relatively great number of devices employing other means of air regulation as compared to those in which springs are employed. As alternatives may be found the weighted air valve with or without partial mechanical control, the hydraulic balance, employed in only one case, so far as is known; and the mechanical interconnection between the jet and air valve or the air valve and throttle. The multiple jet arrangement without provision for extra air introduction may be regarded as another way of admitting the inutility of attempting to govern the mixture by the aid of suction alone, like the mechanical carburetter pure and simple.

Where one carburetter is found to employ a mercury column, the height of which regulates the air opening and itself is governed by the suction; where another employs a positive connection between the throttle and the air inlet, another a series of ball check valves of varying weight, another a series of similar balls, but of the same size and seated over openings of different diameter; and still another the spring seated air valve which has proved so trustworthy up to a certain point—where this much of difference exists in recognized types, it is not to be wondered at that the multiple jet system appears to be gaining ground. However reluctantly the admission may be made, it is conceded by many engineers, moreover, that the latter arrangement, despite its greater complication, is bound to work a little better than the single jet type in its present

form. That this divergence in practice reveals little variety in the form of the jet and its choke tube, however, ably proves the assertion that it is with the mixture, not the vapor, that the real difficulty exists. Also, it goes to show how remote just now is the goal of finality in carburettor design.

#### Possibilities of Body Development.

Perhaps no branch of the automobile industry offers more direct and promising opportunities for development than that of body design. Even granting vast possibilities in the way of mechanical betterments in power plant and chassis construction, it is safe to say that the future will witness most radical changes in conceptions of the purposes and accomplishment of the upper works of the power driven vehicle. So wide and varied are the lines of improvement and expansion open to the body builder, in fact, that it is practically impossible to conceive of their limitations, when the wide range of probable future application of the motor vehicle is considered. In certain more restricted directions, however, it is by no means difficult to indicate ways in which immediate and by no means inconsiderable benefits might be brought about.

To take a single and rather impressive example, the question may be asked: Why is it that the limited traditions of the carriage builder's art should confine the builder of the modern automobile to a body of less width than the wheel tread? For touring purposes and even more insistently for limousine and other enclosed types, the demand is strong for unrestricted interior accommodation. In the direction of the length of the vehicle the passenger space naturally is limited. Beyond a certain point, the rear of the body cannot be extended back of the rear wheels without overstraining the chassis or rendering the vehicle uncomfortable to ride in. In front, present and apparently rational practice places the motor well back of the front axle. Hence, the passenger space is limited in that direction also, save where the general design permits of placing the driver's seat above instead of behind the motor. But in width only a very few vehicles, and those of special types, ever have been brought up to the practical maximum.

An indication of what likely may be expected in future types is to be seen in the wholesome widening of not a few touring

## COMING EVENTS

February 14-19, Buffalo, N. Y.—Automobile Club of Buffalo's eighth annual show in Convention Hall.

February 14-19, Hartford, Conn.—Hartford Automobile Dealers Association's third annual show in Foot Guard Armory.

February 14-19, St. Louis, Mo.—St. Louis Automobile Dealers Association's annual show in First Regiment Armory.

February 14-19, Rochester, N. Y.—Rochester Automobile Dealers' Association's third annual show in Convention Hall.

February 17-19, Grand Rapids, Mich.—Grand Rapids Automobile Club's first annual show.

February 18-22, Fargo, N. D.—Fargo Automobile Dealers first annual show.

February 19-20, Los Angeles, Cal.—Los Angeles Motor Racing Association's track meet at Ascot Park.

February 19-26, Los Angeles, Cal.—Licensed Association of Los Angeles' first annual show in Hamburger building.

February 19-26, Minneapolis, Minn.—Minneapolis Automobile Show Association's exhibition in National Guard Armory.

February 19-26, Newark, N. J.—Associated Automobile Clubs of New Jersey's show in Essex Armory.

February 19-26, Salt Lake City, Utah—Automobile show in Auditorium.

February 21-26, Binghamton, N. Y.—Automobile show in State Armory.

February 21-26, Cincinnati, O.—Automobile Club of Cincinnati's annual show in Music Hall.

February 22, Oakland, Cal.—Automobile Trade Association of Oakland's hill climb.

February 21-27, Cleveland, O.—Cleveland Automobile Dealers Association's annual show in Central Armory.

February 22-27, Milwaukee, Wis.—Milwaukee Automobile Club's second annual show in Auditorium.

February 23-26, Denver, Colo.—Denver Motor Club's annual show in Convention Hall.

February 24-March 3, Toronto, Can.—Ontario Motor League's show in St. Lawrence Arena.

February 28-March 4, Omaha, Neb.—Omaha and Council Bluffs Automobile Dealers' show.

February 28-March 5, Omaha, Neb.—Omaha and Council Bluffs Automobile Dealers' show in Auditorium.

February 28-March 5, Kansas City, Mo.—Kansas City Automobile Dealers Association's fourth annual show in Convention Hall.

March 5, New York City—Annual New York-Boston midwinter endurance run for Perlman trophy.

March 5-12, Boston, Mass.—Boston Automobile Dealers Association's eighth annual show in Mechanics Building.

March 5-12, Cleveland, O.—Cleveland Automobile Club's eighth annual show in Central Armory.

March 5-12, Des Moines, Ia.—Des Moines Automobile Dealers Association's first annual show in Coliseum.

March 17-19, Louisville, Ky.—Louisville Automobile Dealers Association's annual show in Armory.

March 12-19, Syracuse, N. Y.—Syracuse Automobile Dealers Association's annual show in State Armory.

March 20, San Francisco, Cal.—San Francisco Motor Club's hill climb on Nineteenth avenue hill.

bodies this year by the simple device of cutting into the sides in order to form pockets for the wheels, and so lengthening the rear seat. The limit in this direction, however, will not be reached until the total width of the body practically equals the total width of the running gear from outside of hub to outside of hub.

In at least one special touring body deluxe which has been produced in this country, this idea has been carried out successfully. The very respectable addition to the amplitude of the body thus brought about, while contributing largely to its weight, may be compensated for by reducing its length, if necessary. Other objections to it, such as the liability to injury in close running traffic, the implied awkwardness of the entrance and the added

weight above the normal center of gravity, readily may be taken care of by the careful designer in ways which at once suggest themselves upon a moment's thought, and some of which already are in use under different circumstances. Altogether, the possibilities involved appear to be such as cannot readily be overlooked for long, especially when the demand for commodious and comfortable bodies is increasing at its present rapid rate. All that is required in bringing about this and other possible improvements is a disposition to adopt the useful traditions of the carriage makers, along with their skill in construction and art in delineation, without at the same time following too slavishly the traditions which were bred of the older and more restricted conditions of their ancient craft.

## The Five Local Shows that Marked the Week

VIEW OF THE HARTFORD SHOW IN FOOT GUARD ARMORY

### Hartford has a "Big" Show and a "Little" One

Complete to the last detail and surpassing its predecessor in the brilliancy of its decorations and character of exhibits, the third annual show of the Hartford (Conn.) Automobile Dealers' Association was launched under most auspicious conditions in Foot Guard Armory on Monday night, 14th inst., and will continue until the 19th. It is the largest and best motor function that the Nutmeg capital ever has witnessed and reflects great credit on the show committee, composed of F. W. Dart, E. G. Biddle and W. L. Ledger, who worked hard to make the affair a success. The prevailing idea of the decorative scheme is clearly shown in the accompanying photograph and represents the interior of a colonial residence, and to further heighten this effect, the only colors used are red and white. The walls are covered with red and white burlap arranged in panel effect, and the ceiling is hidden by a canopy formed of streamers

of red and white electric lights trimmed with smilax. Over 4,100 lights are used in the illumination scheme, and the decorative efforts represent an outlay of some \$5,000.

Several innovations are introduced this year, among which are a set of cathedral chimes, which ring forth twice each day, accompanied by the turning off of the lights temporarily. One of the striking features of the show is the double decked stage, on the upper portion of which the orchestra holds forth. Although detracted from in effectiveness somewhat by the crowded condition of the stage, where some exhibitors are installed, the vaudeville sketches which are put on each day are a departure which take immensely with the visitors. While at no time suggestive of metropolitan proportions, the attendance was large on the opening night, and bids fair to increase as the show grows more mature.

Considerable ingenuity was required to find room for the 43 exhibitors, and at that not all demands for space were satisfied, several dealers being compelled to hold "private shows" at their salesrooms. There are some 17 exhibitors of cars, who display over 60 machines of various makes and models. Of course, the cut-out chassis operated by electric motors, which are shown at a few stands, are never wanting for attention. Among the newcomers which are seen at a Hartford show for the first time may be mentioned the Lozier, Empire, Flanders, Everitt and Baker electric. What they lack in numbers is more than offset by the accessory men in the wealth of fixings for cars; and the assortment shown by the Post & Lester Co. and Charles E. Miller is well-nigh bewildering. Their displays include practically everything from a cotter pin to a top, and from a tire patch to a wind shield.

The list of exhibitors and their wares follows:

**Gasolene cars**—Elmer Automobile Co., Ford; Reo Automobile Co., Reo and Knox; Brown, Thomson & Co., Stevens-Duryea, Cadillac and Lozier; Palace Auto Station Co., Thomas, E-M-F. and Flanders; R. D. & C. O. Britton Co., Maxwell; Miner Garage Co., Pierce-Arrow and Buick; Kilby & Barrett, Jackson; Dunbar & Mansir, Elmore; Foster & Co., Rambler; Capitol City Auto Co., Mitchell; J. T. Curtiss Co., Inter-State, Velie and Everitt; C. K. Hansen, Hupmobile; S. C. Hutchins, Franklin; Kaeser & Wilbur, Empire.

**Electric vehicles**—Palace Auto Station, Waverley; Electric Auto Station, Baker.

**Motorcycles**—George S. Maslen, Indian.

**Accessories**—Post & Lester Co., Charles E. Miller, Hartford Automobile Boat &

Supply Co., G. W. Fuller Co., Smith-Worthington Co., Holcomb Tire Repair Co., Myhtib Composition Co., Fairbanks Co., H. T. Hart Co.

There really were two shows running simultaneously, although not in opposition to each other. Thus Hartford this week has reached a prominence never before attained in the annals of local shows. In addition to the annual dealers' show in Fort Guard Armory, which is the recognized local motor function of the season, there is another show of lesser size occupying the boards at the Park Casino, better known as the old First Regiment Armory. It is the first effort of the newly formed Connecticut Automobile Show Association, and opened on the 14th in a somewhat incomplete state, several cars having failed to arrive in time. There are some twenty cars on exhibition,

among them the Corbin, Staver, Moline, Jackson, Haupt, Winton and Matheson, several being exhibited by their makers or out-of-town dealers. It is entirely a vehicle show, no accessories being displayed, although it was not because of lack of room, for the spacious building is not in the least tested to its capacity. Resplendent in a coat of white paint and a new floor, the Casino presents a pleasing appearance. The walls are decorated with flags and hanging signs from the ceiling suspended over each booth bear the names of the cars displayed. Streamers of colored electric lights add to the attractiveness of the decorations. While the attendance on the opening night was rather slim, the management hopes for better things during the week. The show will break camp on Saturday night, 19th.

## Stars and Stripes and 65 Exhibitors at Buffalo

To the tune of the Star Spangled Banner and by the pressing of a button by Mayor Fuhrmann, which set over 8,500 electric lights aglow, the annual automobile show under the auspices of the Buffalo (N. Y.) Automobile Trade Association and Automobile Club was inaugurated in the old Broadway Arsenal on Monday night, 14th inst. It will run for the entire week. With the national colors predominating, it is termed the "Old Glory" show, and it is the "largest and best" ever held in the Bison City. Quite different from the outdoor decorative schemes which have been striven for by other show promoters this year, is the Buffalonian idea of a show setting. Under the roof of the big drill shed is a huge American flag, said to be the largest in the world. It is studded with lines of lamps and when illuminated diffuses billows of light from the alternate stripes. There are 48 stars, each set with a lamp, but only 46 are in commission, the remaining two not being connected as the two prospective states, Arizona and New Mexico, will not receive their degree until July. Beneath the flag are 72 tungsten lamps. In the south end of the building is suspended a Curtiss aeroplane, which attracts considerable attention.

There are 65 exhibitors, of whom 38 show cars, there being some 60 makes of

cars on view. Around the side wall are placed shields and rosettes of bunting and at each stand are standards on which are mounted union shields bearing the name of the exhibitor. Of course, home products, as embodied in the Pierce-Arrow and Thomas, are a source of much pride and are centers of attraction. There is a brave showing of accessories and their novel displays and demonstration gather massed groups of interested visitors.

The exhibitors include the following:

**Gasolene cars**: Niagara Motor Car Co., Hupmobile; Joseph B. Schmitt, Lambert; John J. McCullough, Moon; Poppenberg Motor Car Co., Reo; Albert Poppenberg, Overland, Marion, E-M-F.; Densmore Co., Packard; Kane Motor Supply Co., Peerless, Cadillac; Meyer Carriage & Auto Co., Pullman; Franklin Automobile Co., Franklin; Pierce-Arrow Motor Car Co., Pierce-Arrow; E. R. Thomas Motor Co., Thomas; The White Co., White, steam and gasolene; Ralph E. Brown Motor Car Co., Winton and Regal; Mason B. Hatch, Chalmers and Stearns; Centaur Motor Co., Oldsmobile, Oakland and Rapid; Chittenden Motor Car Co., Mora; John J. Gibson Co., Pope-Hartford; J. A. Cramer, Stoddard-Dayton, Mitchell and Courier; Henry Brunn Auto Co., Haynes; Ford Motor Co., Ford; B. & P. Morton Co., Moline; F. A. Sherman,

Inter-State and Empire; Buick Motor Co., Buick and Welch; Co-Operative Motor Car Co., Hudson, Knox and Stevens-Duryea; Maxwell-Briscoe-Buffalo Co., Maxwell; Bison Motor Car Co., Columbia, Abbott-Detroit and Krit; Louis Engel, jr., Cartecar; Dixon Motor Car Co., Velie; G. E. Kibler, Sterling and Black Crow; F. A. Ballou Co., Selden; Windsor Motor Car Co., Kline; Sagamore Motor Supply Co., Ohio; Winter Motor Car Co., Everitt; American Motor Truck Co., American; Victor Motor Truck Co., Victor; Buffalo Maintenance Co., Grabowsky trucks; Powell Motor Co., Rider-Lewis trucks.

**Electric vehicles**: Fargo Electric Garage Co., Detroit; Babcock Electric Carriage Co., Babcock; Brown Motor Car Co., R. & L.

**Accessories**: E. E. Denison Co., bodies and tops; Jaynes Auto Supply Co., supplies and accessories; The Kleinhans Co., motor raiment; P. & F. Electric Co., supplies; Combination Switch Lock Co., accessories; Robertson Cataract Co., speedometers; Iroquois Rubber Co., accessories; F. G. Crone, valve grinding tool; Warner Instrument Co., Warner Auto-Meters and clocks; James G. Barclay, accessories; Cuba Garage Co., accessories.

**Motorcycles**: Emblem Mfg. Co., Emblem; American Motor Co., M-M.

## Patriotic Decorations and 81 Exhibits at St. Louis

Embracing many of the best exhibits shown at Chicago the previous week, the fourth annual automobile show of the St. Louis (Mo.) Manufacturers and Dealers Association was staged in the First Regiment Armory on Monday night 14th inst., and will continue throughout the week. It is the largest and best show that the Mound City ever has seen and is the crowning effort of an indefatigable show committee which set out to eclipse all previous records, and succeeded. The number of exhibitors is more than double that of any

previous exhibition, 66 showing complete cars, and 15 furnishing the accessories that go with them, making 81 all told. Over 200 cars are displayed, representing approximately 90 different brands. Many of these are specially finished machines which were prepared for the Chicago show and subsequently were transplanted, a special train bringing in 40 carloads.

This year's show is being held in the Armory for the first time, which was selected instead of the Coliseum, the scene of previous exhibitions, on account of the

much greater space which it affords. The martial hall has been splendidly decorated, over \$2,000 having been expended to afford an appropriate setting for the exhibits. Red, white and blue are the predominating colors, and the ceiling is concealed by a tent-like canopy. The side walls are decorated with bunting, and flags are employed to relieve the uncouthness of the rafters. Along the sides of the hall are placed large palms, lending a tropical effect to the scene. The floors of the exhibit spaces are covered with white duck bordered with red. This

primping up of the floor, combined with the decorations, serves to produce a most pleasing picture effect. Following is a list of the exhibitors and their offerings:

Gasolene cars—Acme Auto Co., Kisselkar; Bagnell Auto Co., Cadillac; C. F. & J. R. Brown, Peerless; Buick Motor Co., Buick and Welch; Colonial Auto Co., E-M-F.; Dorris Motor Co., Dorris; Ford Motor Co., Ford; Gardner Motor Car Co., Lexington; Halsey Auto Co., Packard and Stevens-Duryea; Kirdell Bros., Reo and Falcarg; Lindsay Motor Car Co., Inter-State; Maxwell-Briscoe Co., Maxwell; Missouri Motor Car Co., American Simplex and Marmon; Moon Motor Car Co., Moon; Olds Motor Works, Oldsmobile and Oakland; Park Auto Co., Chalmers, Thomas and Hudson; Phillips Auto Co., Atlas; Victor Auto Mfg. Co., Victor; St. Louis Car Co., Standard Six; South Side Auto Co., Stanley steamer, Mathewson and Corbin; Sterne Motor Car Co., Great Western, Gaeth and Rider-

Lewis; Swingley Motor Car Co., Stoddard-Dayton; Western Auto Co., Pierce-Arrow; H. F. Van Cleave, Speedwell; McDonald Auto Co., Knox; St. Louis-Stearns Co., Stearns and Brush; White Garage Co., White steam and gasolene; Kingman-St. Louis Implement Co., Rambler; J. Cunningham, Son & So., Cunningham; Darby Motor Car Co., Darby; Petrie-Phillips Auto Co., Parry and Paige-Detroit; St. Louis-Overland Co., Overland; Glide Motor Co., Glide; St. Louis Garage Co., Johnson; Cook Motor Vehicle Co., Krit; Charles F. Luhn, Winton; General Motor Car Co., Hupmobile, Regal and National; Central Garage Co., Sterling; Heler-Royster Auto Co., Apperson, Cartecar and De Tangle; Weber Implement Co., Mitchell; Capen Motor Car Co., Locomobile; John Deere Plow Co., Jackson; Missouri Automobile Co., Westcott; Midland Auto Co., Midland; Eureka Motor Car Co., Empire; Whittaker Motor Car Co., Everitt; Del-

mar Motor Car Co., Buffalo trucks; Haynes Automobile Co., Haynes; Pope-Hartford Auto Co., Pope-Hartford; Franklin Auto Co., Franklin; Springfield Motor Car Co., Springfield; Middleby Auto Co., Middleby; Embree-McLean Carriage Co., Embree.

Electric vehicles—C. F. & J. R. Brown, Detroit; Park Auto Co., Baker; Phillips Auto Co., Babcock; Union Electric Light Co., R. & L., Studebaker; W. C. Lewis, Woods; Priesmeyer-Stevens Co., Waverley; Cook Motor Vehicle Co., Columbus; Oscar Stroh, Broc; Smith Auto & Battery Co.

Accessories—Behen-Faught Motor Car Equipment Co., Western Oil Pump & Tank Co., Phoenix Auto Supply Co., Kupferie Bros., Vehicle Top & Supply Co., H. J. Barton, Henderson Willis Co., Carter Carburetter Co., W. F. Polson, Star Rubber Co., Garage Equipment Co., Lakewood Chemical Co.; F. L. Stewart Building & Realty Co.

## Rochester "Borrows" Grand Central Palace Dressing

With the largest number of exhibitors ever congregated at a local motor exhibition, the third annual automobile show of the Rochester (N. Y.) Automobile Dealers' Association in Convention Hall opened its doors on Monday night, 14th inst., booked for a week's engagement. Although the building has been enlarged during the past year, it was filled to capacity with cars and accessories, and there was the usual proportion of shut-outs who were forced to resort to private shows in their salesrooms. With the acquisition by the alert show committee of the decorations used at the Grand Central Palace exhibition in New York City, and here arranged in much the same manner, the present function easily excels its predecessors in the elaborate nature of its decorations.

Green and white are the prevailing colors, and in the main hall the ceiling is concealed by streamers of the reigning hues extending from the stage to the balcony. Around the balcony runs a series of arches conveying a semi-Oriental effect, while the walls are covered with mural landscape scenes. Dividing the booths are green and white lattice pillars crowned by translucent globes. With about 2,000 electric lights aglow, the hall was lighted more effectively than ever before and added greatly to the splendor of the scene. Of music there was an abundance, no less than three bands, located in different parts of the

building, dispensing melody. On the opening night over 5,000 people attended the exhibition and the box office has continued to do a good business.

There are some 78 exhibitors, 24 of whom show complete cars. Among the latter which are uncovered for the first time are the Cunningham, Brockway and Arnell electrics, all local products. The Cunningham, which is produced by an old carriage firm, is made in one type of chassis only and is built along conventional lines. It has a four cylinder 30 horsepower motor, sliding transmission and shaft drive. Wheels are 36 inches all around. As would be expected from a long established carriage concern, several attractive types of open and enclosed bodies are offered. The list of exhibitors is as follows:

Gasolene cars: William C. Barry, Jr., Selden; Austin F. Crittenden, Haynes; James Cunningham, Son & Co., Cunningham; Franklin Automobile Co., Franklin; Genesee Motor Vehicle Co., Maxwell and Corbin; Gillis-Strickland Co., Locomobile, Hudson and Chalmers; C. E. Hartson, Morra; A. Vernon Hart, Thomas and Oakland; S. J. Macy Co., Palmer-Singer; Arthur McNall, Peerless and Pope-Hartford; Mabbett-Bettys Motor Car Co., Cadillac and Stevens-Duryea; McKenney-Gilpin Co., Overland and Marion; Thomas J. Northway, Oldsmobile and Ford; Oothout & Co., Gaeth; F. W. Peck, Studebaker,

E-M-F., Flanders and Schacht; . H. Rowerdink & Son, Brockway; Rochester Automobile Co., Packard; Fred C. Schutt, Patterson and Middleby; H. E. Tanner, Rambler; W. H. Wilcox Co., Marmon; A. M. Zimbrich, Matheson, Stoddard-Dayton and Courier; Jenkins Motor Car Co., Jenkins; Hollis-Rand Co., C. L. Whiting; Union Motor Car Co., Marsh Walzer.

Electric vehicles: Babcock Electric Garage & Sales Co., Babcock; A. Faber Co., Studebaker; A. V. Hart, Columbus; Max B. Jacobi, Woods; Arthur McNall, Arnell; Sager & Elliott, Detroit.

Motorcycles: A. D. Cook, Curtiss.

Accessories: Rochester Sporting Goods Co., Rochester Rubber Co., Flynn Bros., Beers Bros., Sullivan Bros., Gabel-Hill Co., S. B. Roby & Co., Ideal Carriage Washer & Automatic Water Saver Co., Wheeler-Green Electric Co., Union Oil Works, Charles S. Gibbs, Marks & Fuller, Henry Likely & Co., Rochester Electric Contracting Co., Standard Metal Work Co., George S. Searle, Charles A. Merkel, L. J. Barth, R. Patterson, Sterling Oil Co., Rochester Timer Co., Kimpson Co., F. B. Rae Co., Kellogg Mfg. Co., Rudolph Schmidt & Co., O. J. Garlock, Duffy-McInnerney Co., Harry Harrison, Ward Fisher, Edward J. Geyer, C. P. Smith Co., S. J. Macy Co., Elbridge Engine Co., Horton Boat, Engine & Supply Co., John J. McGreal, Rochester Railway & Light Co.

## Parade Precedes Los Angeles's "Independent" Show

Preceded by a parade of gorgeously decorated cars with over 200 machines in line, the automobile show season in Los Angeles, Cal., was ushered in on the evening of the 7th inst., when the first independent show in the Grand avenue rink, under the sponsorship of the Automobile Dealers Association of Southern California was inaugur-

ated. It was the largest motor exhibition ever held in the Angel City, over 100 machines, comprising some 40 different makes, being exhibited. Although it was termed an "independent" show and most of the cars on exhibition belonged to what is known as the unlicensed division, there were a few licensed cars shown, despite the fact

that the local licensed dealers have arranged to hold a show of their own later. An international flavor was lent to the function by the presence of two well known foreign machines, the Fiat and Isotta, while home prestige was represented by the Durocar and California.

Never before in its history was the in-

terior of the old rink so handsomely embellished with decorations. When the visitors entered the building it seemed like a veritable fairyland, with its thousands of lights aglow. At the intersections of the aisles huge pillars of white and gold were placed, and across the aisles was a trellis hung with mercury wheel emblems. The pillars were wound with smilax and smaller standards were placed at intervals along the aisles. Starting off with a first night crowd of 5,000 people the show proved a good drawing card throughout the week, the total attendance being estimated at 35,000.

Torpedo and gunboat bodies, of which naturally there was a profusion, were, of course, the center of interest. They were shown in several forms and colors, one in battleship gray being particularly attractive. One of the most interesting exhibits in the show was that of the Californio Auto Top Co., where the processes connected with the manufacture of tops were shown. Much interest also was manifested in the electric pleasure cars and commercial trucks, these sections being larger than ever before.

The exhibitors were the following:

Gasolene cars—G. W. Watson, Fiat; California Automobile Co., California, Firestone-Columbus and Monrovia trucks; Standard Motor Car Co., Ford and Velie; American Automobile Agency, American; Burt Motor Car Co., Auburn; Pioneer Commercial Auto Co., Reliance trucks; Williams Auto Co., Petrel; Burkhard-Crippen Motor Car Co., Lexington; Durocar Mfg. Co., Durocar; Vail Motor Car Co., Pennsylvania; W. K. Cowan, Rambler; Jung Motor Car Co., Sterling; Pico Auto & Carriage Co., Paterson and Whiting; Tri-State Motor Car Co., Hupmobile; Fred A. Connell Co., Falcar; Blinn & Kinehan, Welch; Mountain & Carrigan, Royal Tourist and Midland; Angelus Motor Car Co., Rider-Lewis and Lane steamer; W. P. Book, Alco; National Auto Co., National; H. J. Vogel, Great Western; Bosbyshell-Carpenter Co., Dorris; Southwestern Motor Car Co., Badger; Munn Auto Co., Empire; Motor Car Import Co., Isotta and Halladay; M. S. Bulkley, Autocar; Brush Motor Car Co., Brush; W. A. Evans, Waverley; R. & L. Co., R. & L. electric

#### Motor Express with Extensive Plans.

Planning to provide motor truck service that will reach not only from New York to Philadelphia, but will take in Long Island, Atlantic City and a territory including a good part of New Jersey and up into New York State as far as Middletown, the Auto Express Co., incorporated in Paterson, N. J., last year with \$2,000,000 capital, is making ready to place in service some 75 vehicles. The president of the concern, George Hardy Paine, indicates that a large central office will be established in New York City and that trucks will run on a regular schedule through Jersey City and Newark to Trenton, where they will connect with others running to Philadelphia.

## MOTOR CAR FOR KINDERGARTEN

For Use in Bad Weather a Smart Little Body Finds Increasing Favor—Idea of a British Builder.

Primarily a wet weather vehicle, the inside driven coupe may be handily termed a doctor's rig, and so has been named by more than one maker. At the same time, its general convenience for users outside the professional class, who wish to use their cars in all weathers and with the same sort of protection against the elements that

DESIGN OF INSIDE DRIVEN COUPE

is granted by the limousine, make it seem almost a reproach even to appear to limit its use by terminology. For the owner of the small and medium sized car, as well as for the owner who prefers to drive his own machine and carry not more than one or two passengers and no chauffeur, it is eminently fitted. For those who, while desiring the comforts of the inside driven vehicle also wish to have the chauffeur along, there is the rear rumble seat design, which has been introduced in one or two instances, and which, while by no means a beautiful affair, yet serves its purpose most admirably.

The accompanying illustration shows a scheme developed by a British builder to satisfy the requirement of the owner whose particular desire is for means to accommodate the inevitable, though occasional

"extra" man—or woman—who may be expected to pop up at any time and demand a ride. By splitting the main seat and placing that of the principle passenger a little to the rear of the driver's position, it will be seen that an unusually liberal amount of floor space has been secured on the left side of the vehicle. This is utilized by fitting a turn down seat for one to the inside of the dash, thus providing for the more or less unwelcome "third party," while at the same time, in his or her absence, guaranteeing ample room for the second passenger. Thus without crowding the driver, or in any way spoiling the exterior lines of the vehicle, an appreciable amount of extra stowage space also has been provided behind the driver's seat, as well, which may be used for tankage, or for storing small articles, according to the circumstances.

The true hybrid of limousine and coupe, though not yet popular, already has made its appearance in this country. It consists of the coupe type of upper body, fitted over a four or five passenger seating arrangement, and is suggestive of a very much condensed Berlin body, save that there is no dividing partition between the front and rear seats. This type may be made as graceful and ornamental as may be desired, and doubtless will serve a useful purpose, and grow in prevalence within a very short time. Like the smaller coupe, it is one of those supplementary features of the general improvement of conditions in body mounting, which is destined to please and satisfy the more exacting and fastidious classes of the trade.

#### "Punishment" and Marmon Features.

Without undue parade of fact or display of needless detail, the pertinent characteristics of the Marmon "Thirty-two" car are concisely set forth in a neat and compact catalogue just issued by Nordyke & Marmon Co., Indianapolis, Ind., manufacturers of the Marmon cars. The details of the oiling system, which provides for the constant flooding of all bearing surfaces by a supply of newly filtered oil, and which has been a Marmon feature for several years; the general details of engine and transmission construction clear through to the staunch little rear axle and the various body shapes provided, all are depicted and explained.

The title "Punishment" affords opportunity to present in extended form an account of the contest achievements of the Marmon cars during the past year. This material, sometimes fitted into overcrowded catalogues, in this case takes the form of a separate booklet which gives in narrative form the story of Marmon performances in the various events in which it has figured so successfully. "Experience and Opinion" is the title of a third contribution to Nordyke and Marmon literature, just issued, and it contains exclusively the views of more than four score Marmon users, who vouch for the success of the car.

### MAKING TOURING LUXURIOUS

**Pierce-Arrow Adds Touring Landau to Its Regular Line—The Many Conveniences Which It Affords.**

Following the recent exhibition in the Madison Square Garden show in New York City of its elaborate touring landau, the

rapidly as the demand for them arises, however, it is not likely that the innovation of a new model brought out in February for summer delivery will be considered the radical enterprise it would have at an earlier time in the history of the industry.

The object of the new design is to provide every possible comfort for the motorist engaged in extended touring. The car

ment giving the full protection of the limousine.

In order to enhance its value from the convertible standpoint, the open effect is accentuated by the elimination of the customary permanent hood or deck over the driver's seat and the fixed glass front. Instead the driver is protected by means of a folding victoria top, while the usual stand-

PIERCE-ARROW TOURING LANDAU

FRONT VIEW SHOWING FOLDING TOP

Pierce-Arrow Motor Car Co., Buffalo, N. Y., has announced a permanent type of vehicle to be made along similar lines and produced in limited quantities for delivery in time for the approaching touring season. In previous years, the announcement of a

is a development of one built last year for the use of a customer who was traveling abroad and in its present form represents one of the most splendid products of the body builders' art yet mounted on an automobile chassis, considering its practical-

ing wind shield is replaced by a folding glass front, set back of the dash. In open form, therefore, practically the only obstruction to the passengers' view is the framework for the front and the door window frames.

Unusually liberal provision for carrying supplies and spare parts is provided by the adaptation of special boxes built into the running boards and extending the entire length of the boards, from fender to fender. As the top of this locker space is higher than the ordinary running board, a special

LUXURIOUS INTERIOR OF PIERCE-ARROW

new model just after the conclusion of the Chicago show would have been regarded as most extraordinary. With the absolute elimination of the season idea in marketing cars, which has left manufacturers free to introduce new elements in their lines as

bility as a vehicle as well as the variety of accommodation which it affords. While of the type usually classed among closed vehicles, it is so constructed as to afford practically the advantages of the open car when such are required, the alternative arrange-

form of folding step has been adopted, which is raised and lowered automatically by the closing and opening of the side doors and which, when not in use, lies close up against the tool receptacle and entirely out of the way. Thus relieving the

FOLDING STEP DESIGN

space under the rear seat from its ordinary capacity as spare parts storehouse, that location has been adopted as suitable for the drawers which contain the luncheon kit, which forms a part of the complete equipment of the vehicle.

As facilities offered the tourist at wayside hotels are not always of the best, a folding lavatory of the yacht type is installed at the back of the front seat, the cabinet also including ample space for carrying towels, brushes and other toilet accessories. Water for the basin is supplied under pressure from a tank beneath the car. On either side of the cabinet are robe and coat racks. The upholstery is of tooled Cordovan leather, such as has been used in Pierce-Arrow enclosed cars for several years.

By way of luggage carrying capacity, provision is made for the mounting of three small trunks in the boot on the back of the car, while two others, in waterproof cases, may be carried on the roof. The chauffeur's trunk also is provided for in the space usually devoted to supplies, while some idea of the way in which every spare unit of space has been accounted for may be gained from the method of mounting the gas tank under the body. The special mounting is placed on a 66 horsepower chassis, like all other Pierce-Arrow products, of six cylinder construction.

Owing to the necessity of time for the manufacture of these cars, orders for them will not be accepted after April 1st, deliveries to be made later in the year and in time for the touring season. The price of the car complete, except for special interior equipment, is \$8,250. The trunks, lap robes, towels and luncheon kit, it is assumed the owner would prefer by personal selection. If desired, however, they will be furnished with the car at modest advances of \$200 for the trunks, \$65 for the luncheon kit, \$25 for the lap robes and \$10 for the towels.

#### Odd Trailer for a Motor Stage.

So many passengers crowded the accommodations of the automobile stage between Sacramento and Folsom, Cal., that the problem of carrying an increased number without overloading the car or the tires was presented to the proprietor in an urgent way, and that he has taken an ingenious method of solving it is disclosed by the accompanying illustration, which shows the "road train" effect which has been accomplished. Attached to the rear axle of the original car is the rear portion of an additional frame and body, mounted on a regular rear wheel suspension, but void of motor or driving mechanism. By the addition of the "trailer" the passenger carrying capacity of the stage line has been doubled. The outfit, which is equipped with Morgan & Wright tires, has been running between the two cities 4,500 miles a month for the past three months, with no trouble from either the mechanism or the tires, and generally giving satisfaction.

## MOTOR CAR FOR KINDERGARTEN

**Specially-Built Vehicle for Unusual Use—  
The Manner in Which It is Employed  
by Indianapolis School.**

Along with the police patrol, the fire hose wagon and the omnibus, various municipal services which used to be inseparably connected with horse traction gradually are being won over by the motor vehicle, and along with them many which are unofficial. In Indianapolis, one of the latest and most approved of local institutions to be modernized in this way is the private transportation service of the Knickerbacker Hall kindergarten. As the picture shows, the

KINDERGARTEN CARRIER IN USE IN INDIANAPOLIS

little tots who are being helped over the first uneven steps along the path of learning now are carried to and from school in most approved and expeditious fashion, much to their own delight and the edification of their elders. The vehicle employed in this novel service was supplied by the Overland Automobile Co., and in general form bears an unmistakable though unintentional resemblance to the conventional motor "hurry-up" wagon. In service the advantage of the motor kindergarten 'bus has proved to be very great. Not only is the work of collecting and afterward distributing the pupils performed in less than half the time each day that was required when horses were employed, but a greater amount of territory can be covered. Pupils now can be reached who before were practically inaccessible, while it goes without saying that the thirst for knowledge among the very young of Indianapolis has been stimulated to a degree that is wholly unprecedented.

#### The Story of the Cramps.

To the younger generation in the automobile industry, which is familiar with the name Cramp chiefly in connection with the production of bearing metals and bronze

castings for axles and other parts, a world of revelation is contained in the recently issued souvenir volume, "Cramp's Shipyard, 1830-1910." The broad scope at present covered by the William Cramp & Sons' Ship & Engine Building Co. is pretty generally known, though its historical significance in connection with the development of the navies and merchant marine of this and other countries is not so widely appreciated. An inkling of its prestige is afforded to those who may have been unaware of it by the long and impressive list of vessels of all types which have been launched from the Philadelphia yards of the company and which, in its entirety, numbers 366.

The business was founded in 1830 by William Cramp, and was incorporated under its present name in 1872. The I. P. Morris Co.

and the Kensington Shipyard Co., the former contributing a large measure of success to the major enterprise in its special work of producing power plants and the general machinery essential to marine transportation, were later acquisitions.

The foundry business was established in 1885 as B. H. Cramp & Co. and was taken over by the present controlling interests in 1892. Originally engaged in the production of specialized castings for consumption at the Cramp yards, its field has been extended by gradual degrees, assuming most important proportions since 1894, when, by arrangement with the Manganese Bronze and Brass Co., Ltd., of Great Britain, it became sole American concessionary for the processes and formulas of that enterprise. Its important service to the automobile industry has been founded upon the privileges thus acquired, reinforced by the clever artistry and ripe experience bred by many years of manufacturing history lived under the close restrictions of shipbuilding tradition. The history of the company, told in brief language in the volume mentioned, is illuminated by photographs of the more important products in marine and stationary engineering lines and tabulated specifications.

## HERE'S THE GAS TURBINE AGAIN

Originates in England and Suggests Real Progress—Cooling Problem Handled in a Novel Fashion.

Although the gas turbine has not yet materialized in marketable form, its theoretical advantages are so great that it acts as an irresistible lure upon many inventors. Encouraged by the remarkable success of the steam turbine in marine and stationary engineering practice, not a few gas turbine projects are being nourished which in process of time may be expected to materialize. One of the first of these to assume tangible proportions is an English device, the invention of R. E. Morgan, of Birmingham. It is designed specifically for automobile use and has just been disclosed as a commercial prospect. Contrary to custom with sundry gas motors which in the past have been heralded as belonging to this class, the Morgan engine is a veritable turbine, and not an engine of the rotary reciprocating type.

The general principle employed is that of compressing pure air by means of reciprocating pistons and of forcing the air through burner jets in common with a spray of liquid fuel. The flame issuing from the jets impinges directly upon the blades in the stationary turbine casing, their energy and that of a small quantity of steam which is generated in connection with the process of cooling the blades imparting the necessary rotary motion to the engine.

By a rather odd combination of mechanism, the two cylinders which are employed for compressing the air, together with the burner jets, mixing device and a portion of the cooling system, are carried on the rotor member of the engine and with the power shaft and flywheel form its moving element. Reciprocating motion is imparted to the compressor pistons by means of stationary eccentrics.

Such is the arrangement that two charges are supplied to the burners during each revolution of the power shaft, while the combustion is so timed that successive impulses overlap sufficiently to afford a practically unending torque. The same effect also results in ignition of succeeding charges by their immediate predecessors, so that after the first few impulses no outside source of ignition is required.

Referring to the illustrations which are here presented, the Autocar explains the detailed construction of the turbine. The main portions of the engine consist of the outer casing A, on the inner periphery of which the vanes B are cast, and two reciprocating double-ended pistons or pumps C. The shaft D, which is integral with the water lead E and the gasoline lead F, remains stationary when the turbine is run-

ning, and on this shaft are formed the eccentrics G by means of which the pistons C are operated. The combustion spaces are situated at H, the charge being ignited at these points by the sparking plugs J.

The manner in which the charge of mix-

END VIEW

ture is formed and taken to the combustion spaces is as follows: The spaces K surrounding the pistons have communication directly with the open air by way of port L. When the drum and the flywheel are rotated, the pistons C are moved to and fro in their cylinders by reason of their being coupled to the stationary eccentrics G, and this movement of the pistons causes a partial vacuum in each of the pressure spaces M in turn. This vacuum is filled by air entering through the inlet valves N, which air is, during the succeeding stroke, compressed in the spaces M and driven through the automatic outlet valves O when a certain pressure is exceeded. The air thus expelled under pressure escapes by way of

SIDE VIEW

the jets P, carrying with it gasoline which is brought to this point by way of pipe R. The resultant mixture, issuing under pressure from the jets, or burners as the inventor prefers to call them, is ignited in the space H by a spark at the usual type of sparking plug J. The force of the en-

suing explosion, or rapid expansion, acts upon the vanes B and reacts upon the angle of the space H, rotating the whole of the enclosed mechanism and the flywheel.

The burnt gases remain in between the vanes until in due course they are free to escape by way of ports S to the open air through the opposite end of the outer casing to that through which the air entered. Water cooling of the outer casing is effected by means of water jackets T and a radiator in accordance with standard practice, but the inner drum and the vanes are cooled by fine internal sprays. The water is introduced and sprayed at the rim of the drum by centrifugal force by way of pipes E, the steam escaping by the exhaust ports with the burnt gases.

There are two double-acting pistons supplying two combustion spaces, separate and distinct charges will be generated at each space twice in each revolution, so that almost as soon as the pressure from one charge has fallen, another charge is forced through the burner. It is claimed that within a short time of starting the engine the heat of one charge ignites that which follows, so that the electric ignition may be switched off. A regular ignition system is embodied in the standard motor, however, for starting purposes. The high tension current is collected by the insulated disc V and taken along leads W to the plugs. Leakage of gases between the revolving drum and the outer casing is prevented by means of the split rings X, which expand radially, and are pressed laterally by small helical springs Y.

### Explaining a Taximeter Overcharge.

A Rhode Island man visiting New York encountered an experience with a taxicab which opened his eyes to taximeter possibilities. He did not submit as peacefully as some victims, however.

"I ordered on the telephone a taxicab to call for me at Columbia College," he relates, "to take me to the Hotel Plaza, and was told that the price would be 50 cents for the first mile, and at the rate of 40 cents for succeeding miles, the distance to be measured by 20 blocks to the mile, north and south, and seven blocks to the mile east and west. My charge was \$2.10, while it should have been \$1.50. I obtained a receipt from the driver and gave him a quarter tip. In my ride back in another taxicab the charge was \$1.60.

"I wrote a letter of complaint to the bureau of licenses, at City Hall. There it was decided that the charge should have been \$1.50 and the taxicab company was ordered to refund 60 cents. This the company did by sending me coupons which I could cash by calling at its office."

He received the 60 cents after two more letters had passed between himself and the taxicab company. The latter put all the blame on the chauffeur, claiming he was a "green" one and left the meter running while pumping up a tire.

## WHERE EXPORTED MOTOR CARS GO

**Markets in Which the Five Big Automobile Producing Countries Find Customers—Immensity of the Shipments.**

According to a special compilation just made by the Bureau of Statistics of the Department of Commerce and Labor shows that the value of automobiles and parts of exported in 1908 from France, the United States, the United Kingdom, Italy, and Germany, the five leading countries engaged in their manufacture and sale, aggregated more than \$45,000,000, against \$9,000,000 in 1902, a growth of 400 per cent. Automobile exports from the four foreign countries named, taken as a whole, increased from \$8,000,000 to \$39,000,000, a gain of 385 per cent, while those from the United States increased from \$1,000,000 to \$5,500,000, a gain of 450 per cent.

The exportation of automobiles from the United States has developed chiefly in the last ten years, the first record thereof having been made in 1902, when the total was \$1,069,782. By 1905 the annual export had increased to nearly \$3,000,000; by 1907 to \$6,000,000, and in 1909 was nearly \$9,000,000. The foregoing figures include the shipments to the noncontiguous territories and relate both to automobiles and parts thereof sent out of the country.

Meantime importations of foreign-built automobiles have decreased. In 1906, the earliest calendar year for which details are available, the total imports of automobiles and parts thereof aggregated \$5,000,000, but since that time have fallen to \$4,000,000 in 1907, \$3,000,000 in 1908, and \$4,000,000 in 1909. In the four-year period 1906-1909, inclusive, imports of automobiles aggregated \$16,000,000, and domestic exports thereof \$25,000,000, an excess of exports over imports of \$9,000,000, of which excess \$5,000,000 developed in the calendar year just ended.

France, Italy, Germany, and the United Kingdom are the chief sources of the automobiles imported into the United States. Of the importations of 1909, valued at \$3,071,002, France is credited with \$1,670,900; Italy, \$689,454; Germany, \$321,033, and the United Kingdom, \$23,383.

France leads the world as an exporter of automobiles, with the United States second in rank. Statistics compiled from the official publications of the countries named show that the exports of vehicles of this class in the latest year for which details are at hand were: From France, in 1908, \$24,569,000; the United States, in 1909, \$8,667,397; the United Kingdom, in 1909, \$7,610,267; Italy, in 1908, \$5,533,000; and Germany, in 1908, \$3,031,000.

The wide distribution of the automobiles exported from these manufacturing nations offers indirect evidence of improved meth-

ods of travel and transport in various parts of the world. The United States, while exporting most of its automobiles to Canada, the United Kingdom and Continental Europe, sends considerable quantities to its several contiguous territories, and to the West Indies, South America, Australia and various countries of Asia, Africa, and Oceania; while France, Great Britain, Italy and Germany, in addition to their exports to the United States and Europe, send automobiles to many of their colonies, to numerous tropical communities, and to South America.

Of the \$8,667,397 worth of automobiles shipped from the United States in 1909, \$7,750,000 went to foreign countries and \$880,780 to its non-contiguous territories. Of the exports to foreign countries, nearly \$2,500,000 worth went to British North America, \$2,000,000 to the United Kingdom, \$486,136 to France, \$494,238 to Mexico, \$337,414 to the West Indies and Bermuda, \$303,452 to British Australasia, \$240,453 to South America, \$224,068 to Italy, \$181,087 to Germany, and \$209,731 to various countries of Asia and Oceania. The shipments to the non-contiguous territories included \$614,424 to Hawaii, \$249,713 to Porto Rico, and \$16,643 to Alaska.

France's exportations of automobiles, valued at \$24,569,000 in 1908, were distributed as follows: To the United Kingdom, \$11,784,000; to Belgium, \$2,229,000; the United States, \$2,124,000; Germany, \$2,018,000; and Argentina, \$837,000, while Algeria and other French colonies, India, Egypt and European countries received practically all of the remainder.

Italy exported most of her automobiles to European countries: To the United Kingdom \$1,297,000; to Switzerland, \$985,000; and to Germany, \$556,000; while to the United States the exports were valued at \$664,000 and those to Argentina \$571,000, these five countries representing nearly four-fifths of the entire automobile exports of Italy during the year 1908, valued at \$5,538,000.

From the United Kingdom the exports of automobiles in 1908 were valued at \$6,124,000; \$1,859,000 representing parts of automobiles, and \$4,265,000 complete machines. Of the latter, \$592,000 worth went to British India, \$573,000 to New Zealand, \$176,000 to the United States, and \$123,000 to Canada.

Germany in 1908 showed a total export of automobiles valued at \$2,936,000, exclusive of parts of automobiles to the value of \$95,000. Of the automobiles exported in the complete form, those to European Russia were valued at \$567,000; France, \$512,000; Austria-Hungary, \$474,000; the United Kingdom, \$448,000, and to Italy, Switzerland, Roumania, Argentina, Belgium and the United States, in the order named, in amounts ranging downward from \$80,000 to \$65,000.

Though Russia is not mentioned in this report, it is confidently asserted that it will become an important factor before long.

## CANADA NEEDS MORE MOTOR CARS

**Consul-General at Winnipeg Declares the Demand Exceeds the Supply—Great Prosperity Creates a Big Market.**

The great demand for medium priced automobiles in western Canada is made the subject of a report sent by Consul-General John E. Jones, of Winnipeg, to the State Department. In this report the Consul states that dealers have found it impossible to meet the rapidly growing demand, and that American manufacturers should endeavor to exploit the new market. There are 26 makes of automobiles represented in Winnipeg at the present time, but the possibilities of the motor car in Canada are so great that every farmer in Manitoba will shortly possess at least one car, and probably two or three.

"Up to a year ago automobiles were regarded as a luxury," says Consul Jones, "but the great prosperity of the Canadian West during the past year has changed this to a necessity. The farmers are buying automobiles and motor-driven vehicles, and the situation is propitious now for the exploitation of this market. In Winnipeg there are over 500 automobiles, and during the past year the Canadian Pacific and Canadian Northern railroads have installed motor-driven trucks. The five-passenger touring car with a 4-cylinder engine seems to be the favorite pattern. There are a few electrics and there is an increasing demand for them.

"A car that costs between \$1,200 and \$2,000 finds the readiest sale, although the higher priced cars find a good market here. There is a duty of 35 per cent. on automobiles, which would seem almost prohibitive, and a number of American cars are being manufactured in Canada to overcome this handicap. These are the cars that the people generally patronize."

### Winter Motoring Gains in Volume.

Many observers have commented on the extensive and growing use to which automobiles are being put in the winter months, as made evident since last fall, and Benjamin Briscoe, president of the Maxwell-Briscoe Motor Co., has discovered further confirmation of winter motoring activity in the fact that concerns making fur coats and other winter garments for automobilists say that business is far better than in any previous winter. Proprietors of small hotels in the outlying districts, he declares, are jubilant over the increased winter patronage, all of which goes to prove, it is pointed out, that the automobile has become a year round vehicle. The fitting of landaulet, brougham, coupe and limousine bodies has contributed immensely to winter motor traffic, but the use of open cars is increasing as well.

## STERLING CLUTCH DEVELOPMENT

**Ingenious and Unusual Combination of Well Known Principles—How It is Done, and Effect Obtained.**

Among the new things brought out at the recent Chicago show in connection with the hitherto unexhibited cars, it is safe to say that none was more out of the ordinary than the clutch which is embodied in the new Sterling car, produced by the

central driving shaft and also to overcome the effect of centrifugal force. The inner and base surfaces of the wedges are shaped to form a conical surface into which fits the male sliding member by which they are expanded and which is actuated by direct spring thrust along the line of the driving shaft and controlled by the pedal as in the ordinary forms of clutch.

The accompanying illustration shows to good advantage the general idea embodied in the design. The fly wheel A is bolted to the flanged crank shaft B in the usual

are keyed to turn with the shaft D and which are convexed on their opposing surfaces. Within the double conical recess thus formed lie the four segmental wedges J-J, which are grooved on their apices to receive the spring wire K, whereby they are normally held in their retracted position. As the wedges exactly fit the recess between the two discs I-I, their expansion by the axial movement of the conical sleeve L, which is forced along the shaft under spring pressure or withdrawn by pedal movement through the collar M, serves to

STERLING MODEL "O" TOURING CAR

STERLING GENTLEMEN'S SPEEDSTER

Elkhart Motor Car Co., Elkhart, Ind. This device may be classed as a combination in principle of the multiple disc and floating ring types, since it combines the general form and small diameter of the former with the three essential elements and simplicity of active parts which are peculiar to the latter. Furthermore, it embodies in engaging mechanism a remarkably powerful wedging action giving the effect of long leverage and thereby reducing the necessity of employing a heavy spring with its end thrusts to be absorbed and the necessity which it involves of providing heavy actuating gear together with slow-acting pedal movement.

As briefly explained in the Motor World's story of the Chicago show, the method of engagement employed is that of pinching a single flange which is virtually integral with the driven shaft between the body of the clutch and a single thin floating disc. Save for the small effective diameter of the three working members thus employed, which is  $5\frac{3}{8}$  inches, the arrangement is much the same up to this point as that employed in the floating ring or triple plate type of clutch. The actuating mechanism, however, which must be far more powerful than that of the ring clutch in order to compensate for the reduced diameter, is entirely original with the designer.

In order to force the floating disc toward the clutch base and thus squeeze the single driven member a set of wedges is employed which is composed of two bronze discs flat on their outside surfaces, but on their opposing faces convexed; and a set of four segmental steel wedges formed to fit the conical depression between the two discs. A loop of spring steel wire fitted into a notch in the outer edges of the segments tends to force them in toward the

way, the retaining studs being tapped into the clutch body C, thereby securing it to the face of the fly wheel. The body also furnishes a forward bearing, properly bushed, for the transmission driving shaft D, upon which the thick disc E is keyed. This forms the driven member of the clutch. In action it is pinched between the face of the clutch body C and a single saw blade disc F, which is compelled to turn

separate the discs or to permit them to approach one another.

It will be seen that by rotating the cover plate N, which is secured in position by means of set screws, it is possible to adjust the clutch members for clearance under ordinary circumstances, and thus to compensate for wear in the fiber discs. Also it is evident that by removing the cover plate altogether and uncoupling the universal

NEW STERLING CLUTCH CONSTRUCTION

with the clutch body by means of the key studs G-G, which engage serrations in its edge. To prevent abrasion of the active clutch members and also of the engaging mechanism fiber discs are interposed between all live surfaces as indicated at H.

The method of engagement is perhaps the most novel feature of the system. It comprises the two bronze discs I-I, which

joint in the propeller shaft, it is possible to dismantle the clutch with very little labor. The clutch body is filled with ordinary oil and, as in the case of the multiple disc clutch, it is fully enclosed and protected from the inroads of dust and mud.

With only a 30 pound spring, it is claimed that this clutch will drive the car under all conditions without any slipping ten-

gency. Furthermore it is claimed that a peculiar effect is secured in some rather mysterious and unexplained way, whereby the action of engagement instead of being sudden is graduated by the automatic progression of the segmental wedges under the action of the spring. When first engaged, it is said that the clutch sleeve does not slip into its final position at once, but creeps slowly into place, observation of its action when striking a sudden incline or a sandy spot in the road revealing its tendency to be drawn into more complete engagement than exists under light loads. Naturally this results in considerable resistance to disengagement, but actual trials with the clutch have shown the pedal linkage to have sufficient leverage to enable the resistance to be overcome without any difficulty.

The general specifications of the Sterling car in other respects are not extraordinary. The engine is of the four-cylinder vertical pattern, water cooled and with the exhaust valves mounted in the heads. Its cylinder dimensions are  $4\frac{1}{4}$  by  $5\frac{1}{2}$  inches, and its power rating is 28.9 by the A. L. A. M. formula. Certain models also are listed with a 4 by 5 inch motor of the same general design. The floating type rear axle with change speed gear integrally mounted is standard with all models, and the outward proportions both as to chassis and body design are of the approved order.

#### Paris Flood Affects Automobile Factories.

Great damage was done to the French automobile industry by the disastrous flood of January 26-February 3, which inundated practically one-fourth of the country. The center of the motor car industry is Paris and its vicinity, and almost all the principal factories were invaded by the flood. The Renault, De Dion, Brasier, Gobron, Clement, Delaunay-Belleville, Darracq, Mors, Vinot-Deguingand, E.N.V., Unic, Saurer, and other factories all were stopped by the water, which in some of them stood many feet high. It is impossible to say when the tens of thousands of workmen thus thrown out of employment will be able to resume their places in the factories, or to form any estimates of the delays which must necessarily occur in the delivery of cars.

#### Lumber for Bodies Very Scarce.

According to General Manager Holmes, of the Jackson Automobile Co., the increased cost of the lumber of which automobile bodies are made is one of the hitherto unremarked things that has added to the expense of production. Poplar and ash, which should sell at about \$75 per thousand feet, is now held, he says, at about \$125, and is not always easy to procure even at that figure. Mr. Holmes cites the case of a manufacturer who, anticipating a large contract, purchased 1,000,000 feet of such lumber and who, although he could have resold it at a profit of \$50,000, refused to part with it.

#### Automatic Reel to Replace Straps.

As an improvement over the long leather straps which commonly are used from the front of the frame of the car to brace the extension top, a unique device, called the Universal top cable reel, has been brought out by the National Sales Corporation, of New York City. Unlike the leather straps, which are awkward to stow away when the top is lowered, the reel automatically winds up the phosphor bronze cable which supplants the straps, and when the top is up an even tension is preserved on the forward extending cables, eliminating the adjust-

ments which are necessary with the straps. The reel, as shown in the accompanying illustration, consists of an oxidized metal case, housing a threaded drum on which the cable is wound. The drum is controlled by a spring acting through a gear, giving a constant tension. A locking pin is provided to hold the drum securely in any position. In putting the top up a little extra length of cable is unreel and the fastening hook is snapped into position, after which the locking pin is released and the cable automatically reels up to tension. When the top is lowered the cable is unhooked and permitted to wind itself up entirely within the reel case. The reel is declared to fit all sizes and types of extension top, being capable of taking the place of all the different lengths of straps that ordinarily are required to meet the needs of various top equipment.

#### New Telephone Device for Limousines.

Should a pedestrian come upon a limousine car the driver of which is apparently saying sweet nothings to the empty air, it would be rash for him to assume that the driver is mildly crazy or is discoursing just to hear the sound of his own voice, for it is possible that the car is fitted with

what the manufacturers of the device call the "Auto-Auristophone passenger-driver service system." In effect it is a "loud talking" electrical telephone system installed in the car, with a transmitter and reproducer set placed in the passenger compartment and a corresponding set outside for the driver. By means of the system the speaking voice is magnified so that passenger and driver may talk without difficulty in even a noisy thoroughfare. The megaphone transmitter beside the driver's seat permits him to have his voice reproduced electrically inside the limousine in even louder tones than he himself uses. The system, which is made by the H. G. Pape Electric and Mfg. Co., of Buffalo, N. Y., also contains an electric buzzer system, operated by signal buttons, by which the person at either end of the line indicates his desire to communicate, the talking circuit being established by means of the "talking button." It is claimed that a 6 volt battery is ample as a current source.

#### For Protection Against Stone Throwers.

Luckily for the American tourist who patronizes the roads of his own country, hoodlums and urchins in the "States" are not so much given to the pernicious habit of bombarding the motorist with handy-sized rocks as their prototypes in Sunny Italy. There the practice has become so common that J. Wollman, an automobile agent in Padua, representing a German factory, has recently devised an arrangement which protects the driver and passengers of motor cars when passing through districts known to be infested with stone throwers. It consists of wire netting similar to that used on bird cages in the zoological gardens, fitted to four upright tubes and joined to the wind shield, the glass plate of which it helps to protect. The device is not patented, is said to be of very light construction, and has saved Wollman many of the troubles and dangers which formerly he suffered from the malicious stone throwers when driving along the roads at night.

In the tropics the wire net may be made so fine as to exclude the bothersome insects.

#### Five "Girls" from Two Tire Companies.

Girls—good looking girls—always have been favorite subjects for tire manufacturers—that is, for publicity purposes, of course. It is not strange, therefore, that the Firestone Tire & Rubber Co. should have "adopted" not one but three winsome "creatures." The "triplets" make their appearance tiptoeing on the edge of a Firestone tire and form the eye-tickling part of the new Firestone wall calendar, which is of generous size and pleasing coloring. The Ajax-Grieb Rubber Co. has had several "girls," but the newest of them—there are two—are seated in an automobile, which is "going some." They also constitute the basis of a calendar, which is of the expensive cut-out, standing type.

**DURYEY DEFENDS THE MOTOR BUGGY**

**Says the Proper Kind has Merit, "and Merit is Immortal"—His Definition of What is the "Proper Kind."**

A distinction embodying a difference of perhaps greater importance than at first might appear to be the case has arisen between the vanishing motor buggy so-called and a related type of vehicle at present being produced by a limited number of makers. While from a certain point of view the type in question is identical with the motor buggy of a year or two ago, close observers are able to notice significant points of difference. Thus the modern vehicle which has replaced the high wheeled buggy in its pristine form instead of being a more or less crude assemblage of a motor and a horseless buggy, is a veritable automobile in the sense of having all its parts designed for the express use to which they are to be put; while even its wheels differ, now being smaller and more stockily built.

Recent editorial expressions in these columns to the effect that the motor buggy as such rapidly is passing out of existence have stimulated Charles E. Duryea, the veteran inventor and designer, himself the producer of a solid tired vehicle of the carriage type, to analyze the situation and incidentally to distinguish between the real motor buggy and its immediate successor, of the ultimate success of which he is supremely confident. Referring to the Motor World's characterization of the motor buggy as a "vanishing type," Mr. Duryea says:

"If you consider only the motor buggies of short wheel base and similar horse vehicle characteristics you are undoubtedly right. But if you include motor buggies built with an automobile experience and using such automobile features as are proper to use in such structure, then I believe you are wrong.

"As a builder of a rig of this type I undoubtedly get expressions which one not directly in the business cannot get. I have kept an eye on this class of goods ever since I began the first one finished in 1892. It was a horse buggy pure and simple, with a motor for propulsion. It had faults. Gradually we learned them, and gradually the conventional automobile was developed. But at the same time a new class of buyers were developed, and the class for which the original buggy was created way back in 1891, was not taken care of by the new vehicle. The motor buggy buyer still remains, and will remain so far as I can see, for years to come. In fact his tribe is increasing.

"He is the man who does not want to bother with the horse, or who desires better than horse service, and yet does not want the complication and maintenance cost of the automobile. He is the man who wants

a rig for business day and night, the year around. He wants the buggy type because the buggy stands for the simplest and lightest vehicle in the world of the carriage type. He wants to get rid of the mud throwing ability of the large tire; likewise its road rolling, tack finding propensities; to get free from the jolting of the small wheels without having to bother with rubber air bags; to get up out of the mud and dust; to ride above the water of the creeks he must ford; and to carry the mechanism above the rocks of the road. In fact there are many potent reasons why he likes the buggy type. An experience of three seasons with this type has given it a place in my affections which the presence of an air tired low wheeled rig of admitted excellence, idle in the stable, cannot overcome. The proper motor buggy does have merit, and merit is immortal.

"The faults of the motor buggies that have gone, were the faults of my earliest creation. The wheel base was too short; the complication too great, and the weight too heavy. A rig that is pushed and steered must be longer than one drawn by a horse. Its length depends on its speed, but it must be longer than a horse vehicle quite a little. A rig that carries its mechanism on solid tires must be better built, or better designed, than if air cushions interpose between the fragile mechanism and the hard knocks of the road. In many motor buggies the reverse was true. Failure only was to be expected and it is no surprise that it came. The buyer who expected simplicity got practically as many pieces as if he had bought a conventional car, and they were not so well made. No wonder they rattled badly and crystalized quickly. The weight was far from buggy weights. A buggy and a motor hung together with a few bolts do not make a practical motor vehicle. Buggy makers found this out. They added more weight and each addition simply sent the breaking points somewhere else. In despair and their inexperience they had to go to the air tire and the developed construction.

"But this simply proves the incompetency of the builders; not the failure of the type. The buyer is still waiting for the motor buggy of decent base, light weight and parts so few that they can be well and strongly made instead of being flimsy. And it can be given him. These things I can demonstrate from my order book and my product."

**Lops \$125 Off the De Tamble Price.**

Reduction in the price of a De Tamble car this week was announced by the Car Makers Selling Co., of Chicago, Ill., sales managers for the De Tamble Motors Co., of Anderson, Ind. A conference of large distributing agents of the De Tamble line with E. D. De Tamble, president of the De Tamble Company, on the 11th inst., resulted in the 34 horsepower four cylinder touring car being reduced from \$1,400 to \$1,275.

**FRANKLIN ON "SIXES" AND "FOURS"**

**Declares Chief Advantages Claimed for "Sixes" are Erroneous—Heavy Fly Wheels Cause Much Trouble.**

Arguments over the relative advantages of four and six cylinder motor construction for automobile work have ceased to have their former power to excite the respective parties to the one-time heated controversy. But it is needless to suggest that a recent pronouncement issued by H. H. Franklin, president of the H. H. Franklin Co., Syracuse, N. Y., who may be supposed to be equally interested in the fortunes of both types, since he is a producer of both, at one time would have called forth endless expressions of criticism both favorable and adverse. It is Mr. Franklin's opinion that in hill-climbing power and slow-speed throttle running, the six is not superior to the four, despite its oft-claimed advantages in these respects.

"Contrary to popular impression, the six-cylinder automobile will not climb hills any better than a four-cylinder, nor will it run slower on the throttle," says Mr. Franklin. "True, these are the main features claimed by most makers. But they misunderstand six-cylinder construction. The properly designed six-cylinder automobile is lighter per horsepower than the four, smoother in operation and easier on tires. It does not require the heavy fly wheel required for a four-cylinder engine of high power. In four-cylinder construction as power is increased the weight of the fly wheel has to increase more than the power, and therefore the weight in the whole vehicle must be increased, else the vehicle will not long withstand the power of shocks.

"Heavy flywheels are very hard on the driving mechanism. In fact, heavy flywheels cause more trouble to driving mechanisms than anything else.

"The properly designed six-cylinder motor is more scientific than a four. It is a lightweight, highly balanced power plant. Instead of the heavy flywheel required on the four-cylinder motor the flywheel, because of steady engine torque, can be very light. The power plant is easy on the whole automobile from the tires to the engine. When riding or driving you can readily recognize its superior smoothness over the high-powered four."

**No Change in Price of P-S Six.**

Although the Palmer & Singer Mfg. Co. prides itself on giving remarkable value in the P-S cars, there never was a time when it was able to offer a \$3,500 six-cylinder car for \$2,500, despite the fact that their ad. in last week's Motor World made it so appear. The \$2,500 price was a slip of the ad. writer's pen, as the car still lists at \$3,500, and will remain at that figure.

**"CHRISTENING" A NEW GARAGE**

**Brooklyn Dealers Make the Occasion a Notable One—Vaudeville and Champagne Further the Ceremony.**

Few motor car emporiums have been housewarmed and placed in commission with such elaborate ceremony as that which inaugurated the Kenny Motor Car Co.'s new Rambler garage, at Bedford avenue and Sterling place, Brooklyn, N. Y., last week. Lavishly decorated and illuminated with bunting and electric lights both in-

are frequently negligent in handling fire near automobiles and that there is much danger of the explosion of gasoline in the tanks attached to automobiles. Other garages are located in old sheds and shacks is the very heart of the city and thus endanger their locality. Modern garages are well protected from this danger, but the old livery stable garage combination will have to conform to the new fire regulations or go out of business.

**Detroit Dealers Discourage Sunday Work.**

As a day for demonstrating and selling cars, Sunday has been found by many agents the best of all from a business stand-

**MIRRORS TO PROMOTE SALES**

**Chicago Dealer Believes They Exercise Psychological Effect and Equips His Salesroom Accordingly—His Views.**

Mirrors as an aid to making retail sales of cars are being employed experimentally in Chicago, with the idea that they exercise a certain valuable psychological effect on prospective customers. Unlike the big mirrors which sometimes are placed underneath show chassis to reveal the bottom view of the mechanism without requiring that the investigator stoop or crawl under the car, the mirrors employed in the Chicago experiment are principally for reflecting the images of the prospective customers themselves.

"There is no question in my mind," says the agent who espouses the scheme, "that people like to see how they look to other people when they are in an automobile. When we are demonstrating cars we notice that people are continually looking at plate glass shop windows in order to get a view of themselves. It is human nature, just as it is human nature for a man or a woman to look into shop windows or full length mirrors when they are wearing new clothes. There is a distinct feeling of pride and satisfaction to many people in seeing how well they look sitting nonchalantly in a car, and it is while that feeling is strong that there is excellent opportunity for closing a sale. For this reason we are establishing an immense mirror space at one side of our salesroom, so that when people get into our cars they may bask in the contemplation of how aristocratic and opulent they look."

**"Esperanto Cab" Makes Its Appearance.**

One of the new motor cabs to appear in the streets of Paris after the flood is the Esperanto cab. It is so called, however, not on account of its brand, but because its driver is able to converse in the "universal language," as fervid admirers of Esperanto call their favorite tongue, and because it bears a sign denoting the fact. As the Esperanto societies claim a membership of nearly half a million people, it is possible that "cabby's" enterprise may attract patronage to him.

**Hunting Car Built for Lady Watts.**

Specially built cars for special purposes are continually making their appearance, usually showing great ingenuity in providing for all possible contingencies. One of the latest of the sort is the touring car built for Lady Watts by the Armstrong-Whitworth Co. in which she will hunt big game in Africa. The car is of 22 horsepower and can be converted into a tent, and contains a cupboard, lavatory, trunks, hand basin, refrigerator and baggage room.

KENNY GARAGE "ALL LIT UP" FOR ITS "CHRISTENING"

side and out, the establishment, as the accompanying photograph shows, presented a handsome appearance and was visited by large numbers of motorists. One of the features of the occasion was an exhibit of Rambler cars, which was tastefully arranged. The formal exercises in connection with the opening were held in the large repair shop on the second floor, at one end of which a temporary stage draped with flags was erected. The program consisted of speeches and a vaudeville entertainment, winding up with a midnight supper at which champagne flowed. Situated in the heart of Brooklyn's motor car district, the establishment, which will be the local home of the Rambler cars, is conceded to be one of the finest in the Metropolitan district. Its owners are well known contractors, and they did not spare their experienced hands,

**Condemns Garaging in Livery Stables.**

Livery stables are not the best place in the world to keep automobiles stored, according to the opinion of the Louisville (Ky.) Building Department. It is claimed that there are many garages located in stables where horses and mules are kept, and that employes in this class of garages

point, but not a few of the veterans are beginning to feel that it is no little hardship to give up "the day of rest" to the strenuous pursuit of customers, and in Detroit they are taking steps to call a truce for Sunday.

At a meeting of the Detroit Automobile Dealers' Association a resolution was unanimously adopted favoring the closing of the sales departments of the dealers' establishments on Sunday, and it was further voted that the public should be requested, through the press, to ask for no Sunday demonstrations in the future.

The action of the Detroit dealers does not apply to the garage and repair departments. It is recognized that these properly are open on Sunday to take care of the motorists who use their cars on that day. But the sales departments are to be kept closed from Saturday to Monday, and the giving of demonstrations on the Sabbath is to be curtailed to the minimum. The public, of course, will have the final word to say in the matter, and as the man who is able to buy a motorcar also usually is able to "take a day off" when he feels like it, the innovation may not be seriously protested.

**ABOUT MIXING OIL AND GASOLENE**

**Pioneer Who Long Has Employed Such Lubrication Defends Its Use—What His Tests Demonstrated.**

Whether a mixture of gasoline and lubricating oil is reasonably stable or whether it tends to stratify owing to the difference in specific gravity of its constituents, is a question which has been raised in consequence of an automobile expert's condemnation of the method of lubricating internal combustion engines by mixing oil with the fuel in the tank. In an article recently printed in these columns, an opinion on this system was quoted which criticised it on the ground that despite its simplicity and apparent practicability, it was unsatisfactory owing to the tendency of the oil and gasoline to separate. As naturally might have been expected, Charles E. Duryea, the veteran expert and inventor, has risen in defense of a system which he has used quite extensively but, it would appear, without encountering any of the difficulties which an unstable mingling of the fuel and lubricant would be expected to produce.

"Gasoline, kerosene and lubricating oil it mixed will not separate and exist, 'as clearly defined strata in the container,'" he says in contradistinction of the assertion referred to. "Anybody can easily try this, but for those who will not go to this bother a few facts will be welcome.

"If these constituents of crude oil had any tendency toward separation worth while it would not be necessary to distil them to get them apart at the refinery. They would exist in 'clearly defined strata' in the earth and the pump pipe could be put down to the desired stratum at will. Surely this is evident. They will not separate, but tend to mix all the more evenly. In real cold weather I use gasoline to thin my lubricating oil, so that it can be handled easier. If not properly mixed the lighter liquid will remain on top of the stiff oil for days, but once let the heavy oil get warm or thin enough to permit ready motion and they mix with apparent perfectness. Nor will they separate afterward, so that I have ever noticed it. My fuel tanks are about 9 inches deep and I chanced to have one that has been standing filled for three weeks or more without being disturbed. I have just carefully syphoned a test tube full of this mixture from the bottom, and another from the top. The hydrometer shows no difference in density. The cylinder oil I use is a very dark green color, commonly termed black. It colors the fuel very perceptibly—so much so that we roughly estimate whether there is sufficient oil in the fuel by looking at the color. These two samples show no difference in color.

"But even if they did, what of it? The very first jolt which the automobile gets

will toss the liquid about in the tank and insure perfect mixing. So I am compelled to brand the statements made in the article as absolute fabrications.

"The tendency of mixable things seems to be to automatically mix and seek an equilibrium of perfect mixture. The air we breathe has the same proportions miles above the earth that it has at the surface. Glycerine and water are of quite different densities and when the water is first added to glycerine it will remain on top in a clearly defined layer, but soon begins to mix, and in a few days will have perfectly mixed and thinned the glycerine accordingly. In this case the mixing process can be seen and there is no doubt about the lighter liquid going down into the heavier in spite of gravity.

"I have used cylinder oil mixed with the fuel for automobile engine lubrication for years. Think I was the first to use it so commercially, and I am sure it is the coming method for lubricating two cycle engines."

**To Test Chicago's Taximeters.**

Accuracy of the meters on Chicago taxicabs is to be put to the test by City Sealer John Kjellander. His investigation is the result of numerous complaints made by "taxi" passengers that they were overcharged. The test of the meters will be made with a mechanical device designed for the purpose. After a meter has been found to be correct or has been corrected, if found faulty, it will be sealed. A second seal will be placed on the flexible rod which works back and forth in the meter, and a third will go on the rod from the meter to the wheel. While Kjellander does not believe there is an intentional effort on the part of cab owners to overcharge their customers, he says that a broken seal will mean a prosecution, and a penitentiary sentence in case conviction is obtained.

**How to Test Wheels' Alignment.**

Lengthy and rather complex rules for determining the correctness of the alignment of the four wheels of a car frequently are given, but none which equal in simplicity the handman's rule for which a foreign expert is to be thanked. His method is to jack up all four wheels and to paint the tires liberally with a coat of thin white-wash. The wheels afterward are set spinning rapidly, the result being a spattering of the floor in the plane of their rotation. Subsequent testing of the lines so made, by the aid of a straight edge, enables the investigator to obtain a very accurate index of the truth of the wheels and axle alignment.

Knoxville, Tenn., is contemplating an automobile factory as a pleasant possibility "in its midst." Charles Du Fource is named as the promoter of the enterprise, which is to make commercial vehicles only and of which he is to be the manager.

**DAIMLER'S "TRACKLESS TROLLEY"**

**Features of the System in Use in Austria—How It is Operated and the Running Cost.**

For heavy traffic in crowded streets the trackless trolley invented by Ludwig Stoll, an official of the Daimler Motor Co., appears to be a happy compromise between the motor 'bus and the regular trolley car, according to a report to the State Department by Consul-General R. W. Heingartner, of Vienna.

"The system has for some time been worked successfully near Vienna and elsewhere in Austria-Hungary," he says. "Current is taken from the overhead positive wire by flexible cables, and not by a pole or boom. Instead of an underrunning wheel or overrunning shoe, the head or actual current collector is a frame with two small grooved wheels on each side. One pair of wheels runs on the positive, the other on the negative wire, and the cable is suspended from the center of the frame, from which point also is suspended a weighted pendulum, which keeps the wheels well pressed down on the wires. The wheels (or pulleys) run on ball bearings. The trolley runs without sparking. The pull of the cable acting on a very short lever arm, and the center of gravity of the trolley being low, no deviation of the trolley is possible, even in strong transverse pulls. The conducting cable can be lengthened to follow the car by two appliances—an upper sliding knot tied up on the pendulum weight and stretched by a string in the latter, and a cable roller (on the left) with 10 to 12 yards of cable, which can be rolled up or let out by a spiral spring. Thus the car is allowed to run on any part of the road, to overtake other carriages, or to turn anywhere, accommodating itself to all kinds of traffic.

"When two cars running in opposite directions meet, the drivers interchange the trolley conduits by detachable contact boxes, an important advantage over a tram line with one track, on which the loss of time in waiting at passing places is sometimes considerable. The vehicle having this flexible means of taking the current can, it is stated, move as far as 20 meters (65 feet) away from the wire, and thus has powers of adaptability which would be rarely exercised to the full extent.

"The chassis of the vehicles for transport of passengers or goods is made of pressed steel and is supported on the axles by springs. The brakes act on the back wheels. The electrical part comprises a controller of tramway pattern, resistance, and two motors of 20 horsepower each, which really form an integral part of the driving wheels themselves on the Lohner-Porsche principle. There are no other mechanical

parts of control or transmission; it is, therefore, very simple. Hardly any lubrication is required, all the parts of the wheels and motors running on ball bearings. Further, the elasticity of the vehicle itself is considerable, as the springs support only the chassis, the body and the passengers, but no engine, batteries, or transmission gear, there being none of these mechanical complications. The suspension, therefore, is perfect, and notwithstanding the imperfections of the road, gives the impression of moving on rails. Vehicles carrying 3,000 kilos (6,600 pounds) and over have back wheels with iron tires. The cable transmitting the current passes through the interior of the axle. The armature of the motor is fixed by means of keys on the axle itself, and so acts as the nave of the wheel. The rest of the wheel is mounted on an ordinary motor on ball bearings, and is completely protected from dust. The cover serves to hermetically close the motor, as well as to fix it on the axle. Solid rubber tires are fitted to absorb the inequalities of the road."

Not only is the installation of such a service much cheaper than the building of a trolley line, but the cost of operation is also very low. Consul Heingartner gives the following figures as representing the cost of running a car 75 miles daily:

Current (1 cent per kilowatt-hour) .....	\$0.40 to \$0.60
Tires (total load 4.2 tons) .....	1.50 to 2.00
Wages (driver only, also for tickets) .....	1.60 to 1.80
Garage .....	.30 to .40
Taxes, management, insurance ..	.80 to 1.20
Repairs, painting, renewals of cars, and conductors .....	.60 to .80

Total running costs ..... \$5.20 to \$6.80

"This figures out 7 to 9 cents per mile. The line is 2.2 kilometers (1 1/3 miles) long. It passes through narrow streets and around narrow and sharp corners on a continuous steep gradient up and down, the steepest being 10 per cent for a long distance. In order to meet the extraordinary requirements of an intense summer and Sunday traffic, two separate aerial lines are provided to let the cars pass without stopping. The positive pole of each conduit is connected with the conduits of the city tramways, and the negative pole with their rails. At both termini loops are arranged, so that the cars are continually running round. Four elegantly fitted cars, each for 24 passengers, are in service on this line."

#### Rubber in Lubricant for Springs.

For lubricating the leaves of leaf springs and also to prevent the encroachment of rust, a compound consisting of grease, graphite and rubber has been recommended. Heated and properly mixed while in solution, the proportion of the ingredients should be, roughly, two parts old rubber, in the purest form obtainable, and one part each of grease and flake graphite.

## PUTTING OILERS TO THE TEST

How They are Tried Out in Maxwell Factory Before Being Installed on Cars—

Advantages that Accrue.

It is characteristic of the methods of the more modern automobile manufacturers that steps are taken to reduce the cost of testing the mechanical portions of the product to its lowest terms and also of eliminating waste as far as possible by the simple expedient of group assemblage and group testing of the various units. In the earlier stages of the industry it was customary to assemble the entire car and then to sub-

Maxwell oilers is carried out. As recently told in these columns, the Maxwell-Briscoe Motor Co., Tarrytown, N. Y., this year has introduced into all its models a multiple, pressure feed oiler of original design and construction.

After the completion and testing of each of the individual parts which go into this device, each oiler is mounted on the test bench along with a large number of similar devices, and is connected with its own individual supply tank, and driven from a special line of shafting. The feeds from the several oilers on the bench are conducted into pans which are divided into measured compartments. Therefore, the exact quantity of oil fed from each delivery tube can be ascertained with close accuracy merely

ARRANGEMENT OF MAXWELL OILERS UNDER TEST

mit it to a gruelling test, in which every component was subject to close inspection and adjustment, necessitating frequent replacement of parts.

The more recent and approved way is to permit no single part, however small and insignificant, to pass from the department in which it is made until it has been subjected to rigid inspection and test both as to strength and size. Similarly the individual parts are assembled into complete groups or units, which, in turn, must be tried out under operating conditions before being passed on to the final assembler. The result is that such faults as arise are checked in season to curtail any expense in replacement, while the amount of time and labor consumed in the final tryout of the vehicle is reduced to a minimum.

A good illustration of the scrupulous way in which this principle is applied is furnished by the accompanying picture, which shows the testing bench upon which the final inspection and adjustment of the new

by noting the depth of oil in the several compartments at the end of a stated period. Should an oiler fail to deliver the required amount it is at once examined, and if not subject to adjustment is discarded without causing the final tester any anxiety or endangering the condition of any "green" bearings in the new car.

#### Drastic Remedy for Stuck Valve Cap.

No small difficulty frequently is encountered in removing the caps which in common practice are used to cover the valves of automobile engines. Where these are of countersunk form an effective if somewhat hazardous method of loosening them is to run the engine until it is thoroughly warmed and then to pour a small quantity of cold water into the depression. The shrinkage thus occasioned will tend to cause a separation between the threads on the cap and those on the larger body of metal in the cylinder, which is not so readily cooled by water.

### FIVE CLUBS CHOOSE OFFICERS

**Jersey Association Selects Wood for President—Berger Heads the Quakers—Three New Organizations.**

Delegates from automobile clubs throughout the state were present at the annual meeting of the Associated Automobile Clubs of New Jersey held in Newark last week and the following officers were elected for the ensuing terms: Joseph H. Wood, Orange, president; J. H. Edwards, Jersey City, first vice-president; E. H. Radel, New Brunswick, second vice-president; H. A. Bonnell, East Orange, secretary and treasurer. Action was taken on the request of the New Jersey Automobile and Motor Club that the by-laws of the state association be so amended as to permit of the clubs throughout the state paying a per capita tax only after the end of their fiscal year. Heretofore the clubs have paid at the beginning of the year, and frequently have included payment for some members who would drop out of the club shortly after payment was made, and for these no rebates were available. The by-laws were accordingly amended as requested by the local club, and in this way the possible contingency of the latter organization withdrawing from the state body has been avoided.

Officers for the ensuing year were elected last week by the Quaker City Motor Club, of Philadelphia, as follows: L. D. Berger, president; G. Douglas Bartlett and J. Fred Betz, 3d, vice-presidents; H. C. Harbach, secretary; Arthur T. Stewart, treasurer; board of governors, G. Hilton Gantert; F. C. Dunlap, A. G. James, Frank Hardart, R. E. Ross, A. E. Maltby, George M. Graham, Paul B. Huyette and Evans Church.

The San Marcos, Tex., Automobile Club perfected their organization last week and elected the following officers for the ensuing year: R. E. McKie, president; H. N. Hefferman, secretary and treasurer. There are sixteen members in the club, and application has been made for affiliation with both national and state organizations.

Motorists of Belleville, Ill., have formed the Belleville Automobile Club and elected the following officers: August H. Barthel, president; A. Albert Muren, vice-president; I. H. Wangelin, secretary, and Frank B. Smiley, treasurer. It was voted to affiliate with the state and national associations.

Thirty-eight motorists of Rockford, Ill., signed the charter list of the Rockford Motor Association at the organization meeting last week, and the following officers were elected for the ensuing term: C. J. Lundberg, president; I. L. Cutting, first vice-president; G. K. Barnes, second vice-president; W. E. Dewey, financial secretary; H. H. Havens, corresponding secretary,

and W. F. Woodruff, treasurer. One of the important aims of the new organization is to co-operate with the police and endeavor to secure fair treatment for law-abiding motorists, who, it is claimed, have been persecuted by the bluecoats in the past.

### Visiting a Lighthouse per Motor Car.

All that is necessary to make an automobile run as well on water as on land is to have the water frozen hard enough, as a mock serious investigator has discovered, and this condition having been brought about so far as the Hudson river is concerned, a number of machines have taken to the ice for short excursions. Of all the

CRUISING ON THE HUDSON

places along the Hudson where cars essay trips over the frozen surface, probably none finds more machines on the river than Tarrytown, N. Y., where the Maxwell-Briscoe Motor Co. has its home and where a lighthouse stationed in the river makes a popular objective point for such journeys. The light house is so tightly frozen in that a machine can be driven right up to it, as shown by the accompanying illustration of Berry Rockwell, of the Maxwell advertising force, and a companion, who accomplished the feat in a Maxwell car without difficulty. Indeed the lighthouse people themselves have in some instances been among the earliest discoverers of the possibilities of making automobiles a means of communication with land. Captain A. Kelberg, in charge of the lighthouse in Tappan Zee Bay, and an enthusiastic motorist, put his car into commission promptly, as soon as he found the ice solid enough to carry the machine, and has been running it back and forth between the shore and the lighthouse regularly. With ice-yachts skimming past at a mile-a-minute clip, the trips are full of excitement.

### WHEEL TAX LISTS MANY MOTORS

**Chicago's City Collector Exacts Tribute from 7,171 Machines—His Figures Show a Gain for Automobiles.**

Owners of no less than 7,171 automobiles paid for the privilege of using Chicago's streets last year, according to a report of E. J. Magerstadt, City Collector of Chicago. This money was collected under the provisions of the now famous wheel tax ordinance of 1908, to which the automobilists of the Windy City submitted after a long and losing fight, despite the assertion of the city collector that the automobile owners "paid the tax very cheerfully."

The total revenue derived from the wheel tax ordinance last year was \$501,836.77, according to the official report, and for the year preceding \$438,856.92, or \$940,693.69 for the two years. During the two years the city has expended \$945,155.91, which shows that Chicago's streets must have been in a very bad state of repair.

The city collector's figures are interesting and they show a noticeable increase of motor vehicles during the year. The total number of automobiles of all kinds taxed in 1908 was 5,577, and in 1909, 7,171, an increase of 1,594. The report follows:

	1908	1909
1-horse vehicles .....	37,086	39,826
2-horse vehicles .....	17,109	17,484
3-horse vehicles .....	391	357
4-horse vehicles .....	41	39
6-horse vehicles .....	3	2
Automobiles seating two ..	.....	2,423
Automobiles seating more than two .....	.....	4,339
Automobile trucks .....	.....	409
Total automobiles .....	5,577	7,171
Total .....	60,207	64,879

### Dragging Brakes Cause Loss of Power.

Rather a peculiar case of lost power in a machine which was in the hands of its owner recently was traced to an unusual condition in the brakes which, since it might arise in any one of a number of machines now on the road, is worth taking note of. On investigating the cause of the weakness, an expert discovered that the rear wheel brakes were not developing their full power when the lever was placed in the "on" position, and this discovery led to the final location of the original trouble. As in many other instances of the sort, the difficulty lay, not in the engine at all, but in the brakes, which were dragging. The small cam device whereby the brake shoes were expanded had, in some way, worked loose so that it stood at an improper angle to the rocker arm through which the brakes were actuated. The result was that the complete release of the brakes occurred only when the lever was in mid position, while at both the "on" and "off" extremes the brakes were partially, but not fully, applied.

### One Advantage of Joint Ownership.

The severity of the decision of the Pennsylvania State legal authorities that every person driving an automobile which is not his own personal property is a chauffeur within the meaning of the law and must have a driving license, has been somewhat softened by an opinion given to State Highway Commissioner Hunter by Assistant Deputy Attorney-General William H. Margest. Mr. Margest's opinion is that no driving license is required when one or more persons are joint owners of a registered motor vehicle, as the law exempts owners of cars from taking out driving licenses. Thus a husband and wife and others of a family can sign an application for a car registration as joint owners of the machine and be exempt as individuals from securing driving licenses. Meanwhile some of the Pennsylvanians who are unwilling to be mistaken for professional drivers will test the new State automobile licensing law for the purpose of securing a judicial interpretation of the word "chauffeur." Stanley F. Cooper, a member of the Quaker City Motor Club, was arrested last week for operating an automobile without a driver's license. He was operating his sister's car at the time for the purpose of testing the law against a person operating an automobile not his own.

### How Tar on Roads Helps Health.

The health authorities of an English city who investigated complaints they had received from residents along highways that had been sprinkled with tar to prevent dust being raised, have reported that not only does the tar act as a preservative for the road surface and prevent dust being raised by the wheels of automobiles and carriages, but that it is highly beneficial owing to its disinfectant properties. The number of cases of infectious diseases in the past five years along the highways that were not tarred averaged 12 per mile, while the average along the tarred roads was only four per mile.

Aside from its value as a disinfectant, there is not the least doubt that tar is a cure for the dust evil. It provides a surface which is not reduced to powder by wheel friction or the hammering of horses' hoofs. Advocates of tar sprinkling for roads declare if it is generally adopted the time will come when, save for the dust that may be blown on the roads from neighboring fields, the only source of trouble will be that which is due to the passing of animals along the highways.

### Surgeons Find "the Chauffeurs' Fracture."

Surgeons have discovered a new disease caused by the slipping of the crank handle of an automobile, and have named it "the chauffeur's fracture." It is distinctively an occupational ailment and consists of a peculiar and complicated fracture of the bones of the forearm which, though not very painful at first, is extremely dangerous and dif-

ficult to heal. Dr. William S. Thomas, of New York, who reported upon this new disease to the Medical Society of the State of New York, told of several cases where chauffeurs with dangerous fractures from being struck by a crank handle have driven their machines for miles after the accident without knowing that they were badly hurt. A feeling of numbness in the forearm was the first indication they had of anything having happened to their bones.

### Could Judge Horseflesh, but not Cars.

"How to buy an automobile for \$20" is indicated by the experience of a purchaser at an auction sale that was held at a big New York livery stable. A number of buggies, a surrey, two sleighs and a brougham, the last bringing \$227.50, were disposed of. Then an electric runabout was placed under the hammer. It was the first sale of an automobile by these horse dealers. The auctioneer asked for a bid.

"Ten dollars!" There was a pause. None knew the value of an automobile in this emporium of horses. They wondered if the ten-dollar man was stuck. Then came a cry of "Twenty dollars!"

The machine went for this, the lucky purchaser being Paul C. Kaminsky. He carefully examined his property. "I wonder if it's worth it," he said.

An automobile dealer, happening in, looked it over. The tires were worth twice \$20, the new body of the machine was worth \$200, the five extra batteries amounted to another \$20, the meter was worth \$50, and the rest of the machine would bring another \$100.

### Cause of Flickering Headlights.

Flickering of acetylene headlights frequently is not only annoying, but a source of danger. It may be avoided by a correct arrangement of the piping. The latter should slope directly down from the generator to the lowest point of the system. Here a pocket should be arranged to hold moisture carried over with the gas and condensed in the cold piping. From this point the piping ought to slope continuously upward toward the lamps, or at least for a distance of 20 inches or so, in order to drain any moisture carried past the lowest point back into the pocket. Wavy piping of soft copper and small diameter cannot be expected to render perfect service, and it is advisable to use brass tubing of at least 1/8 inch inside diameter, properly supported and perfectly jointed.

### Fender Idea Finally Reaches Tacoma.

The dear old idea, fenders for automobiles, has been resurrected in Tacoma, Wash., and apparently has hit the town hard. The type of fender, or "cowcatcher," to be used has not been finally decided upon, but several examples were shown at a recent meeting of the city council, which may or may not enact the necessary legislation.

### Perlman to "Settle" Momentous Question.

L. H. Perlman, of New York, who used to style himself the "Motor King" and who was more or less responsible for about the unholiest road scorches that ever masqueraded as contests, has broken out in a new place. This time he has "thought up" something real sweet—a "popular car voting contest," which, however, does not mean that the cars will vote; for they will leave New York at 6 o'clock A. M., March 5, and finish at the automobile show building in Boston at 9 o'clock that evening, or, at least, the "polls" will close at that hour. The distance is, roughly, 240 miles. The "ex-king" expects to have newspapers in five cities en route print ballots, and any manufacturer or dealer or owner who solicits or buys the largest number of ballots will, of course, have the most "popular car." The privilege of being voted for will cost \$50 per car and the one receiving the most votes will obtain a trophy given by Perlman. Of course, a pacemaker will be provided and no speed law will be violated, for Mr. Perlman hopes that this suffragetish contest will "mollify" the legislators and "reflect credit on the trade."

### De Palma and Robertson are Matched.

Homer C. George, the New Orleans man who promoted and conducted the recent Mardi Gras meet in that city, has become a matchmaker. As the result of discussion growing out of that affair, he says that he has offered \$5,000 for a match race between Ralph DePalma in his Fiat and George Robertson in his Simplex, and that both men have signed the necessary articles of agreement. Each will receive \$1,000 as appearance money, and the remaining \$3,000 will be awarded the winner of the race. No date or track has been yet selected, but George says the match will be decided at a two days meet and will be run in three and five mile heats on the first day.

### This Magistrate was Accommodating.

By holding court in the open street to dispose of a speed case, Magistrate Steinert, of the West Side Court, New York, last week established a precedent. Court had adjourned and the magistrate and his probation officer were walking homeward when they saw a motor car in charge of a policeman come along. The magistrate was hailed by the policeman on the front seat, heard the case, paroled the prisoner in the custody of his employer until the next day, and everyone went away rejoicing.

### Germany Promotes International Test.

An international endurance test for light cars will be held in Germany this year, on May 1st to 4th. The route is to be: Berlin-Bielefeld (May 2d), Eisenach (May 3d), Rothenburg (May 4th). Only entries of three-car teams will be received, the entry fee being \$300. The contest is being promoted by the Kaiserlicher Automobile Club, 16 Leipziger Platz, Berlin W.

**T**HE new Rambler, because of its quiet ease of motion, reserve power, and dignity of comfort, affords to the busy man pleasing relaxation and healthful recreation with family or friends at the end of the day. For satisfactory operation in crowded city traffic, on boulevard, or country road the new Rambler, because of the offset crank-shaft, is capable of three or sixty miles an hour, on high speed, climbing any hill with gratifying ease. The Spare Wheel obviates tire trouble. With straight-line drive, big wheels and tires, and new expanding clutch the new Rambler is superior to all in efficiency and better than any in quality, silence, and comfort.

Rambler automobiles, \$1,800 to \$2,500

Main Office and Factory: Kenosha, Wis.  
Branches: Chicago, Milwaukee, Boston, Cleveland and San Francisco

## RECENT PATENTS.

942,124. Internal Combustion Engine. Charles G. Wridgway, New York, N. Y. Filed Dec. 31, 1908. Serial No. 470,201.

1. In an internal combustion engine, the combination of a piston cylinder having a port for both inlet and outlet; and a rotary spherical valve for said port, whereby one valve man control both the inlet and outlet at said port.

942,219. Vehicle. Albert F. Rockwell, Bristol, Conn., assignor to The New Departure Manufacturing Company, Bristol, Conn., a Corporation of Connecticut. Filed May 11, 1905. Serial No. 259,860.

1. In a vehicle, a supporting base, a body having movement with relation thereto, means for maintaining parallelism between said base and said body, said means including rockable elements connected to said base and said body, rock arms upon said rockable elements, a cylinder adapted to receive a fluid cushion, and pistons in said cylinder and connected to said respective rock arms; substantially as described.

941,015. Resilient Tire for Vehicles. George O. Draper, Hopedale, Mass. Filed April 5, 1909. Serial No. 487,922.

1. The combination with a wheel rim provided with shoe-clamping means, and a shoe connected with the rim by said means, of a core for the shoe, comprising a holder and a series of inflated balls mounted therein, the normal cross sectional arc of the core being greater than that of the interior of the shoe, whereby the balls and adjacent portions of the holder are compressed by and within the shoe when the latter is acted upon by the clamping means.

941,056. Transmission Gearing. Albert R. Behne, St. Paul, Minn. Filed April 9, 1909. Serial No. 488,793.

1. A transmission gearing, comprising a differential gear mechanism and shaft or axle sections connected therewith, a disc secured to said differential gear, a series of pins arranged in concentric circles in the face of said disc, a fixed gear centrally mounted with respect to said disc, a drive shaft parallel substantially with the plane of said disc, an idle gear thereon normally meshing with said fixed gear, and a series of pinions slidably mounted on said drive shaft, one of said pinions being adapted to engage said idle gear and temporarily lock it on said drive shaft, or move out of engagement with said idle gear and engage the pins of the inner circle on said disc, substantially as described.

941,101. Differential Mechanism. David E. Ross, Brookston, Ind., assignor to Ross Gear and Tool Company, La Fayette, Ind., a Corporation of Indiana. Filed April 24, 1905. Serial No. 257,255.

1. The combination of a power or drive shaft, driven gears, a shaft intermediate said power or drive shaft and said driven gears, driving gears on said intermediate shaft, and differential mechanism comprising compensating gears mounted on said intermediate shaft, said compensating gears being driven by said power or drive shaft, substantially as specified.

941,124. Ignition System for Internal Combustion Engines. Charles B. Askew, Chicago, Ill. Filed Nov. 14, 1907. Serial No. 402,064.

1. In an ignition system for internal com-

bustion engines, the combination with an engine providing sparking appliances, of a suitable circuit breaker therefore, a plurality of battery cells connected in series relation with each other, and means comprising a switch and a governor, responsive to the speed of the engine for varying the number of cells in circuit to increase or decrease the electro-motive force of the ignition current with the increase or decrease in speed of the engine.

941,157. Spark Plug. Charles A. Martin, Racine, Wis. Filed March 21, 1908. Serial No. 422,380.

1. In a spark plug, the combination of an outer casing adapted to be screwed into the cylinder wall of an engine, the inner end of said casing provided with an inwardly extending ledge or flange, said ledge or flange provided with recesses, an insulating tube extending inwardly into the casing to a desired extent, a guard or deflector, the end thereof being in the form of an outwardly extending cone and having the apex thereof pointing toward the casing and apertured, the said end provided with arms extending toward the casing, the ends of the arms being bent outwardly to form internal projections which are adapted to be passed through the recesses of the ledge or flange of the casing and to thereby detachably engage above said ledge or flange, and an electrical conductor extending through the insulating tube, and having its inner end in close proximity to the aperture.

13,045. Protector for Rubber Tires. Herbert R. Palmer, Cleveland, Ohio, assignor, by mesne assignments, to Frederick E. McEwen. Filed Jan. 6, 1905. Serial No.

## YOUR CAR NEEDS

**GOODYEAR**  
Straight Side  
**Detachable Auto Tires**  
Because They

- Are Always Oversize—Each size is much larger than rated.
- Won't Rim Cut or Force Off the Rim, even though ridden deflated.
- Won't Creep, though no tire bolts are needed.
- Give Extreme Mileage, often twice or three times that given by the best of ordinary tires.
- Are Supreme in Resiliency.
- Are Easiest Removed and Replaced in case of need.

Are the BEST Tires Procurable, as demonstrated by contracts from practically every maker of a high-class Automobile in the U. S.

At the Grand Central Palace Show Goodyear Tires led in number of cars equipped by over 40 per cent.  
Send for our valuable book "How to Select an Auto Tire." It's full of pointers for the motorist who has no money to waste. It's free. Send for it TODAY.

### FOSTER SHOCK ABSORBER

Home Office and Factory: 1417 E. 40th St., Cleveland, O.  
Branch: 1926 Broadway, New York City

239,908. Original No. 717,263, dated Dec. 30, 1902. Serial No. 110,510.

1. A protecting covering for a vehicle tire consisting of a flexible backing carrying flat-headed rivets whose heads are on the outer side of the backing and are in staggered position and nearly abut, but do not overlap, and whose shanks extend through the backing and are upset on the inner side thereof, substantially as described.

941,406. Carburetter. Julius H. Cooper, Rochester, N. Y. Filed March 27, 1908. Serial No. 423,697.

1. A carburetter of the class described, comprising a wall portion forming a mixing chamber, said chamber having an outlet, a conical base carried by the wall portion, a fuel passage communicating with said chamber through the apex of said conical base, said base having a peripheral series of air inlets therethrough, a piston engaged slidably in the chamber, and having a conical recess in its base arranged to engage closely with said conical base, said piston being arranged to close said air inlets when so engaged, said piston having an upwardly flared opening concentrically therethrough, a needle valve seated upon the apex of said base, means for operating said valve to admit fuel to the chamber, operative connections between said piston and the needle to raise the piston for the admission of air in fixed ratio with respect to the quantity of fuel entering the chamber, and means for adjusting the connections between the needle and piston to vary the said ratio.

941,407. Transmission Controller. Claude E. Cox, Indianapolis, Ind. Filed June 10, 1908. Serial No. 437,639.

1. A controller for automobiles comprising a lever adapted to be moved in either direction from a medial position, means connected to said lever for connection with two speed controlling members of a transmission mechanism to alternately operate said two members by opposite movement of the lever, and means for normally yieldingly holding said lever in medial position, said means comprising a stationary abutment, a pair of fingers engaging said abutment on opposite sides thereof, means for yieldingly holding said fingers in engagement with the abutment, and a member connected to the lever and lying between said fingers for the purpose set forth.

941,517. Motor Vehicle Construction. Emil Gruenfeldt, Cleveland, Ohio, assignor to The Baker Motor Vehicle Company, Cleveland, Ohio, a Corporation of Ohio. Filed Jan. 23, 1908. Serial No. 412,235.

1. In a motor vehicle construction, the combination of a vehicle frame mounted upon springs; a fixed axle member upon which said springs are mounted; a motor connected with the live member of the axle, and yieldingly supported upon said frame; and means rigidly secured to said fixed axle member and loosely connected with said motor.

941,574. Pilot Light Shifting Attachment for Vehicles. Ernest E. Hampton and Cicerio G. Smith, Palisade, Colo. Filed Sept. 11, 1907. Serial No. 392,314.

1. In an automobile or similar vehicle, the combination of a steering rod, a worm wheel on said rod, a gear in connection with said worm wheel, connections comprising a lever and shaft therebetween and the wheels for changing the angular position of the latter, a plurality of lamps, a rotatable upright on which each lamp is mounted, connections between said lamps, an arm fixed to one of said uprights, and connections between said worm wheel and arm, comprising a rod and a lever on said shaft to which the rod is connected, whereby said lamps are moved angularly concurrently with the angular movement of the wheels.

941,654. Automobile Buffer Bar. James H. Sager, Rochester, N. Y., assignor to J. Sager Company, Rochester, N. Y., a Corporation of New York. Filed Oct. 18, 1909. Serial No. 523,367.

1. In automobile buffer-bars, the combination with a cross rail to receive the shock, or similar, separated sleeves attached thereto and projecting at right angles therefrom; rods adapted to slide within said sleeves, respectively; springs interposed between said rods and cross rail; means for attaching said rods to the automobile frame; and means adjustable at right angles to said rods for bracing said rods horizontally and vertically; substantially as shown and described.

941,739. Operating Device for Vehicle Lamps. John P. Stein, Reading, Pa. Filed March 29, 1909. Serial No. 486,240.

In an operating device for vehicle lamps, the combination of a steering apparatus comprising in its makeup a transverse rod, with two rotatably mounted lamps, brackets on which said lamps are supported, oscillating holders in which said lamps are mounted, a rearwardly extending arm formed on each of said holders, a second transverse rod pivotally connected at both of its ends to the ends of rearwardly extending holder arms, and a pair of stringers rigidly secured to said second transverse rod and to the transverse rod of the steering apparatus, so that both said rods will move exactly the same distance when the steering apparatus is operated.

941,983. Vehicle Seat. Frank J. Elsner, Racine, Wis. Filed June 30, 1908. Serial No. 441,070.

A supplemental seat for automobiles comprising in combination, a supporting bracket having a vertical socket, a seat-support-

## Babcock Speaks:

**Buffalo Manufacturer Throws Down the Gauntlet.**

MR. F. A. BABCOCK of Buffalo, N. Y., manufacturer of the famous Babcock Electric says: After reading the catalogues for 1910, of the eight leading manufacturers of "Electric" automobiles, it is self-evident that some of them are either mistaken, or

guilty of misrepresentation, for their respective claims all read alike, and it is obvious that only one "Electric" can be the "best."

### We have \$1,000.00

which says that the "Babcock" has won every stock contest in which it has been entered;

That it has made the fastest time both on the level and on the hills of any stock "Electric" yet constructed;

That no other stock "Electric" has made as many miles on one charge, under the same conditions, and had its run certified to by creditable and disinterested witnesses;

That no other stock "Electric" runs so fast either on the level or up hill;

That no other stock "Electric" is so safe, easy to operate and economical.

Eight Perfectly-appointed Models.

ing arm having a vertical pintle at one end slidably fitted and journaled in said socket and having means to interlock therewith to prevent the arm from turning, an upwardly extending stud at the other end of said arm, a collar at the base of said stud having the periphery thereof notched, a hinged seat embodying a bottom cross bar having a central opening receiving said stud whereby the seat may be turned around said stud as a center, and a locking finger on the seat bottom adapted to engage any one of the notches of said collar when the seat is lowered.

941,993, Anti-Slipping Tread Attachment for Motor Vehicles. Michael Jensco, Butler, Pa. Filed Nov. 13, 1908. Serial No. 462,476.

1. In a motor vehicle, the combination with the vehicle body, and the rear axle thereof, of wheels carried by said axle, guides upon the rim portions of the wheels, sleeves slidably mounted on the hubs of the wheels, gripping spurs radially movable in said guides and operatively connected to said sleeves for projection and retraction by reverse movements thereof, pivoted operating levers connected with the sleeves, reversely arranged bell crank levers connected with said operating levers, a link connecting the bell crank levers, and a main operating connection coupled to one of said bell crank levers.

## DENIES WHEELER AN INJUNCTION

**His Effort to Control a Carburetter Situation Meets with Set-back—Patent Which He Tries to Exploit.**

Claiming patent control over carburetters that have the air inlet and the throttle outlet interchangeable, Wheeler & Schebler, of Indianapolis, Ind., have brought suit against the Generator Valve Co. and the Monarch Valve Co., of Brooklyn, N. Y., but in an attempt to obtain a preliminary injunction against these companies the Indianapolis firm on Saturday, 19th inst., met with defeat. The hearing took place on Friday, the day preceding, in the United States Circuit Court for the Eastern District of New York, sitting in Brooklyn, and Judge Thomas I. Chatfield, in denying the Wheeler & Schebler petition prepared his decision in so short a time that he will take further occasion to go over it before publishing it, although its general character was made known to the attorneys and the orders for the denial of the injunction were executed.

It was due to the fact that trouble threatened several of the exhibitors at the motor boat show now current in Madison Square Garden, New York, that the court was induced to take action on short notice.

Such infringement as is alleged to exist is based on one patent, No. 806,434, dated December 5, 1905, and in the motion for a preliminary injunction the issue is confined to the first claim. This claim is for the combination, with the main casing of a carburetter, of an air inlet attachment and a throttle valve attachment, and means for securing these attachments to the main body of the casing so that they may be interchanged in position. The arrangement permits the inlet to be secured at the top and the throttle at the side, or the throttle at the top and the inlet at the side. The attorney for the defense, Henry D. Williams, of New York, indicates that a search

at Washington has disclosed eight prior patents, each of which completely anticipates this idea, and many others that approach it closely.

### Two Cities Seek Outdoor Shows.

Rivalry between Detroit and Indianapolis for a gigantic outdoor automobile show of some kind has resulted in the filing of two applications with the National Association of Automobile Manufacturers by the respective cities. The Detroit application was made by the Detroit Automobile Dealers Association and that for Indianapolis was filed by Carl G. Fisher, one of the directors of the Motor Speedway. In each case it is aimed to have the exhibition national in character. The applications have been referred to the show committee of the association for consideration.

### Clifton Sails South for Rest.

Charles Clifton, president of the Association of Licensed Automobile Manufacturers and treasurer and general manager of the Pierce-Arrow Motor Car Co., of Buffalo, N. Y., on the 21st inst. sailed with Mrs. Clifton on the steamship Moltke from New York for a month's cruise to the West Indies and the Spanish Main. The trip to the Caribbean will include a visit to the Panama canal district.

### Bump Leaves Franklin for Owen.

F. R. Bump has been made sales manager of the Owen Motor Car Co., of Detroit, Mich. He has been with the H. H. Franklin Mfg. Co., of Syracuse, N. Y., in a similar capacity for the past six years. His departure from Syracuse was marked by a banquet given by the local dealers' association.

### Toepfner Quits Before Commencing.

The Toepfner Motor Car Co., of Bay City, Mich., which was organized to build motor trucks, has "seen the light" and will not enter the field of automobile manufacture. The money has been returned to the purchasers of the stock.

## GARDEN SHOW TO RUN TWO WEEKS

**First Week for Pleasure Cars, Second Week for Commercials—Dates Chosen and More Space Arranged.**

Solving the situation arising from the passing away of the American Motor Car Manufacturers Association and the great increase in the list of licensees under the Selden patent, the Association of Licensed Automobile Manufacturers has completed plans for a two weeks 1911 show at Madison Square Garden, New York City; the first week for pleasure cars, and the second for commercial vehicles. The dates selected are January 7 to 14, and 17 to 24. Although the tentative plans in this direction have been discussed freely with the car and accessory manufacturers for several weeks past, the actual decision on the part of the Association was not reached until last week, when Charles Clifton, president of the Association, signed the contract with the Madison Square Garden Co. before leaving on a southern trip.

Quite different from anything before seen at the Garden, the arrangements which are to be made for accommodating 80 pleasure car exhibitors will entail a radical rebuilding of the structure's interior. By extending the elevated platform so that it will be 50 feet wide, with another platform overhead, at least 20,000 square feet more will be available than the maximum at any previous Garden show. In addition to the 80 car exhibitors, there also will be accommodations for 27 exhibitors of motorcycles and for 300 motor and accessory manufacturers.

Work is to commence early in July on the preparation of the interior construction, which will be made in sections to permit rapid installation. When the pleasure vehicle show closes on Saturday night, the 14th, the cars will be removed and their places taken by the commercial vehicles.

The signs and carpets also will be changed, but the main decorations will be carried through both exhibitions and will be found standing when the commercial show opens on Tuesday, the 17th of January.

While the present licensees under the Selden patent number in the seventies, further increases are to take place shortly, which will probably make more than 80 pleasure car exhibitors desiring space in the first week's show. No more than 80 can be provided for in the first week, and a few may be content with space the second week among the commercial exhibits. It will be optional with the accessory and motorcycle exhibitors whether they exhibit for one week or for both. While the present list of concerns in the Licensed rags who are making commercial vehicles also does not appear impressively large, it is officially stated that "many members of the Licensed Association are now turning their attention toward commercial vehicles and will have their products ready for the fall trade and for exhibition at the January show."

#### **"E. V." Receivers Ask for Discharge.**

Although the Electric Vehicle Co., of Hartford, Conn., was recognized last June as the Columbia Motor Car Co., the receivers have not been discharged as yet, but steps toward this end have been taken in the issuance of a notice for a hearing concerning their application for an approval of the sale of the assets and the acceptance of final account. The application was filed in the Superior Court of Hartford county, at Hartford, on the 18th inst., and the hearing itself is set for March 4. The receivers, Halsey M. Barrett and Henry W. Nuckols, state in the application that they have sold and conveyed the assets and property of the Electric Vehicle Co., have completed their administration as receivers and have filed their final account.

#### **Wyandotte Secures Another Plant.**

Having secured a magneto factory, Wyandotte, Mich., has undertaken further to enlarge its list of new enterprises by obtaining an automobile building plant. The concern will be known as the Swift Automobile Co., and will have its factory on Mulberry street, adjoining that of the Whistler Mfg. Co., the magneto manufacturers. The land has been paid for in stock of the company and concessions have been made in the way of free water and exemption from taxes for five years.

#### **Crescent Evolves Into Walker-Stoops.**

The Crescent Auto Top Co., of New York City, has consolidated with Alfred J. Walker and has moved to a new fireproof building at 218-20 West Sixty-fifth street. Hereafter it will be styled the A. J. Walker-Stoops Co., Inc., its officers being A. J. Walker, president; James C. Stoops, vice-president, and A. J. Walker, Jr., secretary.

## THE CHIEF CAUSES OF FAILURE

### **Bradstreet's Says There Are Eight of Them, Insufficient Capital Being First—The Record for 1909..**

Dealing with the subject "Why Men Fail," Bradstreet's says: "Many years of experience have shown that eight leading causes are subjective and attributable to those who fail, while three others exert their influence from circumstances existing without the individuals themselves. These causes are grouped as follows:

"Due to faults of those failing—Incompetence, irrespective of other causes; inexperience, without other incompetence; lack of capital; unwise granting of credits; speculation, outside regular business; neglect of business, due to doubtful habits; personal extravagance; fraudulent disposition of property.

"Not due to faults of those failing—Specific conditions, disaster, etc.; failure of others, of apparently solvent debtors; competition.

"In 1909, 81 per cent. of the failures were attributed to the faults of those failing, grouped under the above eight causes, as against 77.5 per cent. in 1908, 81.1 per cent. in 1907, and 79.7 per cent. in 1906. The three causes classed as beyond the individual's control accounted for 19 per cent., as against 22.5 per cent. in 1908, 18.9 per cent. in 1907, and 20.3 per cent. in 1906. There is here indicated something like a return to normal in 1909 as regards predisposing causes. In 1908, it will be remembered, the returns indicated the effects of the 1907 panic strain projected into the succeeding year, the effects of the panic trouble not becoming visible, as regards the number of failures, until 1908, because of the occurrence of the trouble in the last quarter of 1907.

"As regards liabilities, it might be noted that 72.5 per cent. of the failure damage in 1909 was attributed to the faults of those failing, as against 62 per cent. in 1908, 44.6 per cent. in 1907, and 72.9 per cent. in 1906. Causes outside of the individual's control were responsible for 27.5 per cent. of the liabilities in 1909, as against 38 per cent. in 1908, 55.4 per cent. in 1907, and 72.1 per cent. in 1906. It will be recalled that very large suspensions in the last quarter of 1907 swelled the aggregate of failure damage very largely, and to this cause is to be attributed the large increase in the percentage attributed to specific conditions, under which head panic strain and unsettlement naturally come as a cause beyond individual control.

"Lack of capital, as usual, looms up as the most notable single predisposing cause of failure, the proportion last year being 34.5 per cent., as against 34.2 per cent. in

1908, 37.1 per cent. in 1907 and 35.9 per cent. in 1906."

#### **Another Injunction Against Graham.**

Suit for infringement of patent, brought by the Supplementary Spiral Spring Co., of St. Louis, Mo., against John Hector Graham and his supplementary spiral spring enterprise in New York City, has resulted in a decision and injunction against him in the United States District Court for the Southern District of New York on the 16th inst. No defense being made, he was declared guilty of infringement "pro confesso." The New York decision is in the nature of a sequel to similar litigation in Boston, where Graham's boldness in appropriating the St. Louis company's name and trademark resulted in a sweeping injunction and reproof by the court.

#### **More Cars to be Built in Anderson.**

Anderson, Ind., has promise of an addition to its automobile manufacturing activity in a project backed by W. S. Poling and Guy Derthick, who are preparing a factory on Jackson street for the production of Stanley gasoline cars. The latter previously were manufactured in Troy, O., by a company which has just dissolved, and the plans and patterns to which the Anderson enterprise has fallen heir provide for a \$1,000 and a \$1,600 model.

#### **Fire Damages Abbott's New Factory.**

Fire damaged the new plant of the Abbott Motor Co., of Detroit, Mich., on the 12th inst., causing a loss estimated at \$3,000. The building, which is located near Hendricks street, between Meldrum avenue and the belt line, is almost completed and the fire will not delay the company's removal from its present manufacturing headquarters on Champlain street.

#### **Omaha Supply House in Trouble.**

The Western Automobile Supply Co., of Omaha, Neb., has confessed judgment for \$23,293 in favor of Attorney George E. Pritchett, whose son has been interested in the business and who has lent it \$23,000 since last July. The partners in the concern include John W. Madden, William H. Horn and Harold L. Pritchett.

#### **Atwell Gets a Michelin Branch.**

J. A. Atwell has been appointed manager of the New York City branch of the Michelin Tire Co., of Milltown, N. J., succeeding J. Wilbur Hobbs, who recently resigned. For a long time Atwell has been a special factory representative of the Michelin company.

#### **Warner Again Enlarging Its Factory.**

The Warner Instrument Co., of Beloit, Wis., has broken ground for an addition to its factory. The new building will be 100 x 32 feet and will house the plating and polishing room together with a brass foundry.

**BRAZING PROCESS CAUSES TRAGEDY**

**Terrific Explosion Results in Death, Injury, Fire and Wreckage—"Home-Made" Oxygen Used in the Process.**

A somewhat mysterious explosion occurred on Washington's Birthday in Alton Laine & Co.'s automobile welding and repair plant at 351 East 74th street, New York City, and resulted in the death of one mechanic and serious injuries to another, as well as in the demolition of the building. The whole neighborhood was thrown into a panic, and it took five fire companies and the police reserves of two stations to put out the resulting fire and restore order.

Arthur Cormier, the dead man, and his brother, Henry, were at work together in the welding room brazing an automobile engine, while two other employees were in the main office, some distance away, when suddenly an oxygen tank 4½ feet high and 20 inches in diameter exploded, shot through the roof of the working shed, hurdled the main building and came down on the other side of the street. The roof of the shed collapsed from the force of the explosion and the glass rattled down from the rear windows of three First avenue tenement houses overlooking the plant. The windows on the east side of the Bohemian Presbyterian Church, adjoining the welding plant on the west, were shattered, while the church furniture within was thrown into disarray.

The manager of the concern states that in their autogenous welding process "home-made" oxygen was employed, which might account for the explosive power manifested by the gas. Oxygen, manufactured under such conditions, occasionally contains impurities which, with the addition of gasoline fumes, acetylene and other carbon hydrates, as well as carbon monoxide, form exceedingly dangerous explosive mixtures. The acetylene tank standing a few feet from the oxygen receptacle did not explode, but contributed to the subsequent fire.

**Mertens Returns to Columbia Cars.**

Eugene R. Mertens, who for the past month has been superintendent of the Whitlock Coil Pipe Co., of Hartford, Conn., has resigned to return to the Columbia Motor Car Co., in the same city. He formerly was assistant superintendent at the Columbia plant, but now returns with larger powers and duties than before.

**True Blue Runs up Colors in Detroit.**

Another automobile manufacturing concern has been organized in Detroit, Mich., to be known as the True Blue Motor Car Co., and its capital has been placed at \$100,000. Edmund M. Coombs, of the Michigan Top Co., and the Coombs-Gilmour Co., the Mitchell distributors, is in the enterprise, together with Maurice Wolf and

Wallace E. Brown, of the Michigan Gas Mantle Co. It is proposed to build a \$1,300 car, but as yet the first car has not been completed and the matter of a factory location has not been decided.

**Two Plants for Detroit Body Builders.**

In line with the expansion spirit pervading the manufacturing side of the industry in Detroit, Mich., the Briggs Mfg. Co., of that city, making bodies, trimmings and the like, has purchased an additional plot of ground and is erecting a four story brick building which will give an estimated capacity of 120 bodies per day. The new plant will be operated in addition to the Boulevard plant now running, and is made necessary by largely increased business. Walter O. Briggs, president and general manager, will continue to direct the destinies of the B. F. Everitt Co., of which he also is the head.

**Court Appoints Receiver for Pierson.**

As a result of the bankruptcy petition filed against it in January, a receiver has been appointed for the Pierson Motor Supply Co., of 43 Cortlandt street, New York City, the proprietor of which, Walter G. Pierson, died a few days before the filing of the petition. Judge Holt has named William Henkel, Jr. The liabilities are about \$10,000 and the assets \$4,000.

**Eagle Prepares to Fly Higher.**

The Eagle Mfg. Co., of Appleton, Wis., which is capitalized at \$6,000, is to be reorganized as a \$200,000 company for the manufacture of automobiles, according to Saiberlich brothers, its proprietors. It will change its name to the Eagle Automobile Mfg. Co., and will make a \$2,000 car. W. D. Legge has been engaged to handle the mechanical end.

**To Reproduce Swiss Truck in Chicago.**

An American reproduction of the Saurer truck, a Swiss product, is to be manufactured in Chicago, Ill., by a company headed by W. M. Thompson, president of the Chicago Iron Store. Associated with him in the enterprise are A. B. Scully and W. D. Sargent, together with "a number of other prominent capitalists."

**Superior to Build Big Factory.**

The Superior Motor Vehicle Co., recently incorporated in Buffalo, N. Y., and of which J. Willis Lansing is the president, has announced plans for a four story factory, 70x400 feet. The structure is to be on Elmwood avenue, at the junction of the New York Central belt line tracks.

**To Manufacture Tops in Omaha.**

Automobile tops are to be manufactured in Omaha, Neb., by the E. W. Reynolds Mfg. Co., which has started operations at 1008-10 Jackson street. E. W. Reynolds, of Kansas City, is the president and general manager, while George Dupy has charge of the mechanical department.

**TAXICAB COMPANIES GET TOGETHER**

**Organize and Incorporate Association to "Secure Freedom" and "Reform Abuses"—Friction Over Accident Claims.**

So many difficulties and troubles assail the companies operating taximeter cabs in New York City that several of the larger concerns, including the New York Taxicab Co. and the New York Transportation Co., have formed an organization which is to be known as the New York Motor Cab Owners' Association. The association was incorporated last week under New York state laws, its incorporators having been approved by Judge Amend of the Supreme Court, and its objects, as stated in its charter, are "to foster the interests of those engaged in owning or operating motor taximeter cabs and to reform abuses relating to the business of persons so engaged; to secure freedom from unjust and unlawful exactions; to obtain and diffuse accurate information on matters relating to the business, and to procure uniformity and harmony between employers and employees."

Indicative of the extent of the legal side of a cab company's troubles, action was brought last week by the New York Taxicab Co. for the recovery of possession from Lewis D. Mooney, an attorney, of papers in 200 accident suits now pending against it. It transpired that there are actions for more than \$1,000,000 pending against the Taxicab company in the Supreme Court and for more than \$70,000 in the City Court. The Taxicab people carry liability insurance with a London company, and it is alleged that during the past few weeks the insurance people have refused to approve claim adjustments of \$10,000 arranged by Mooney and have withdrawn approval of \$2,000 in claim adjustments previously approved.

**Waterloo Woos Dart from Anderson.**

Waterloo, Ia., has wooed the Dart Mfg. Co., which manufactures commercial and farm vehicles, from Anderson, Ind., and in the Iowa city the company will be reorganized with \$250,000 capital. Like the Maytag-Mason Automobile Co., which was drawn from Des Moines to Waterloo, it is to receive financial encouragement from the citizens of the latter place.

**Gramm to Operate Two Factories.**

The Gramm Motor Car Co., which has been making commercial vehicles in Bowling Green, O., is to have a plant in Lima, O. The latter will be the main factory, the establishment in Bowling Green being continued as auxiliary.

**Burke Leaves the Mora Service.**

W. W. Burke, manager of the Mora Co.'s New York branch, has resigned that office. He has not yet indicated his next move.

**The Week's Incorporations.**

Milwaukee, Wis.—Buick Motor Co., Flint, Mich., under Wisconsin laws, with \$500,000 capital; to do business in Wisconsin.

Chicago, Ill.—Auto Specialties Mfg. Co., under California laws with \$50,000 capital; to manufacture automobiles, appliances, etc.

Milwaukee, Wis.—Kopmeier Motor Car Co., under Illinois laws, with \$100,000 capital; to deal in automobiles and accessories.

Albany, N. Y.—Fort Orange Garage, under New York laws, with \$5,000 capital. Corporators—John, John J. and Elizabeth E. Snyder.

Altus, Kan.—Altus Motor Car Co., under Kansas laws, with \$8,000 capital. Corporators—E. E. Hilmeyer, D. G. Norris, Altus; Tom R. Moore, E. H. Vox, Olustee.

Cleveland, O.—Auto Plating & Mfg. Co., under Ohio laws, with \$10,000 capital. Corporators—T. S. Hammer, Emmett T. Dowling, Ida L. Brunst, Harry Ochs and Fred Enter.

Fitchburg, Mass.—Fitchburg Cab & Automobile Co., under Massachusetts laws, with \$50,000 capital; general automobile business. Corporators—S. M. Nathan and others.

Glens Falls, N. Y.—Co-Auto Service Co., under New York laws, with \$50,000 capital; to deal in automobiles and supplies. Corporators—C. H. Peddrick, Jr., G. Tait, B. G. Higley.

Boston, Mass.—Manhattan Motor Truck Co., under Massachusetts laws, with \$10,000 capital. Corporators—Alphonso E. Kenney, Medford; William H. Britton and Philip Dooskin.

Cincinnati, O.—Queen City Motor Car Co., under Ohio laws, with \$10,000 capital. Corporators—Samuel A. Cantelon, Albert A. Degenhart, H. C. Busch, I. M. Boring and Robert Cantelon.

New York, N. Y.—Vetter Auto Top Co., under New York laws, with \$10,000 capital; to manufacture automobile tops and appliances. Corporators—Wm. Vetter, F. E. Stoll and May Baker.

Knoxville, Knox county, Tenn.—Knoxville Auto & Garage Co., under Tennessee laws, with \$50,000 capital. Corporators—H. H. Thrasher, J. R. Irby, W. H. Gass, N. B. Kuhlman and J. E. Suty.

St. Louis, Mo.—Michelin Tire Co., under Missouri laws, with \$10,000 capital; to deal in automobile tires. Corporators—M. A. Wilson, E. M. Gough, J. O. Wilson, S. T. L. Dyer and A. J. Goodbar.

Pittsburg, Pa.—Silent Motor Car Co., a Delaware corporation with \$300,000 capital. Corporators—J. Sturtevant, New Kensington, Pa.; J. W. Waesch, Beaver Falls, Pa.; C. C. Conkle, Pittsburg, Pa.

Cleveland, O.—Goby Engine Co., under Ohio laws, with \$100,000 capital. Corporators—Christian Girl, Lewis W. Thomas, George G. Cockburn, Clifford S. Goby, John B. Hull and J. M. Frederick.

Dayton, O.—Geyer Sales Co., under Ohio laws, with \$10,000 capital; automobile manufacturers sales agents. Corporators—Carl F. Geyer, E. D. Hinsley, D. J. Smith, Edgar Daniels, Albert McCray.

Vincennes, Ind.—Vincennes Motor Mfg. Co., under Indiana laws, with \$5,000 capital; to manufacture gasoline motors and motor vehicles. Corporators—W. T. Havill, M. E. Hunter and C. H. Huston.

Memphis, Tenn.—Jerome P. Parker Co., under Tennessee laws, with \$100,000 capital; garage business. Corporators—Jerome P. Parker, Maxwell P. Patterson, J. E. Squire, Christopher Kastner and J. B. Parker.

Lebanon, N. H.—Lebanon Automobile Co., under New Hampshire laws with \$15,000 capital; general automobile business. Corporators—E. Bertram Pike, Pike; Dr. Frank A. Smith and Henry F. Knapp, Lebanon.

Providence, R. I.—Fiat Automobile Co. of Rhode Island, under Rhode Island laws with \$10,000 capital; general automobile business. Corporators—Jefferson K. Crawford, Frank R. Hunter and Edward R. Bancroft.

Los Angeles, Cal.—Los Angeles Motor-drome Co., under California laws, with \$250,000 capital. Corporators—F. E. Moskovice, R. A. Rowan, F. W. Flint, Jr., H. D. Lombard, H. W. Keller, H. G. Gerard and Frank Garbutt.

Bristol, Conn.—Connecticut Cab Co., under Connecticut laws with \$500,000 capital; to manufacture taxicabs. Corporators—Albert F. Rockwell, Ernest R. Burwell, Charles T. Treadway, Ira Newcomb and T. H. Holdsworth.

St. Louis, Mo.—United Electric Storage Battery Co., under Missouri laws with \$10,000 capital; to deal in motor vehicles. Corporators—Edgar Leussier, George A. Clark, Paul W. Deichman, John J. Langton and August J. Gernhardt.

Jamestown, N. Y.—Lilly Engine Co., under New York laws, with \$150,000 capital; to manufacture and deal in automobiles, motorcycles, motors, etc. Corporators—C. H. Henderson, J. R. Graves, Corry, Pa.; G. H. Monroe, Jamestown.

Wabash, Ind.—Standard Automobile Co. of America, under Indiana laws with \$500,000 capital; to manufacture automobiles. Corporators—G. J. Kobusch, W. S. McCall, A. R. Walton, W. B. Phelps and F. D. McMahon, St. Louis, Mo.

Louisville, Ky.—L. W. Thompson Co., The, under Kentucky laws, with \$5,000 capital; to deal in automobile accessories etc. Corporators—L. W. Thompson, J. F. Ecker, Louisville; R. P. Thompson, Gallipolis, O.; James Fintze, Newark, O.

Hinsdale, N. H.—F. F. Cameron Co., under New Hampshire laws with \$20,000 capital; to manufacture ball bearings. Corporators—W. N. Pike, H. W. Taylor, James O'Brien, G. S. Smith, F. A. Davis and R.

D. Taylor, Hinsdale; John O'Brien, Bernardstown, and F. F. Cameron, Beverly, Mass.

New York, N. Y.—Belnord Automobile Storage and Supply Co., under New York laws, with \$10,000 capital; to deal in rubber tires, operate storage houses and garages. Corporators—I. Irving Cohn, Henry M. Flateau and Joseph Marx.

Jersey City, N. J.—Marion Acetylene Specialty Co., The, under New Jersey laws with \$25,000 capital; to manufacture articles employed for the working, control and operation of automobiles. Corporators—E. C. and A. Bournonville, all of Jersey City.

Detroit, Mich.—Michigan Motor Truck Co., under Michigan laws, with \$1,000,000 capital. Corporators—Herbert M. Thomas, James C. Brown, Frank C. St. Aubin, Charles N. Bristol, Francis X. Petz, W. D. Clizbe, Frank Ford, Carl G. Granacher and Harry G. Pullman.

**Increases in Capitalization.**

Racine, Wis.—Racine Mfg. Co., increases capital to \$400,000.

Indianapolis, Ind.—Airless Tire Co., from \$225,000 to \$250,000.

Paterson, N. J.—Auto Express Co., from \$15,000 to \$2,000,000.

Cleveland, O.—Derain Motor Car Co., from \$30,000 to \$60,000.

Portland, Me.—Taxicab Co. of Maine, from \$25,000 to \$100,000.

Waukesha, Wis.—Waukesha Motor Co., from \$25,000 to \$100,000.

Sheboygan Falls, Wis.—The Falls Co., increases capital from \$15,000 to \$150,000 and will engage in the manufacture of spark plugs.

**"Standardized" Rims Definitely Shelved.**

As a sequel to the setback which the United Rim Co. received from the tire committee of the Association of Licensed Automobile Manufacturers, when the latter refused to accept the "standardized" types of demountable rims offered by the former, a meeting of the rim patents holding company was held in Akron, O., on Friday last, at which it was decided to abandon the "standardizing" movement. The various tire companies composing the United Rim Co. could not come to any definite agreement regarding the future of the corporation, which probably will dissolve, but the meeting had the effect of leaving all free to disregard the "standard" forms and use whatever rims they like.

**Nebraskans to Make Tire Protectors.**

Puncture-proof tire protectors are to be made in Grand Island, Neb., by the newly formed Simpson Auto Co., which has been organized by W. E. Sampson and W. H. Sampson. The concern is beginning operations at 312 West Third street, where it has established a small factory.

## IN THE RETAIL WORLD.

Caldwell, Idaho, is to have a modern garage; L. Adams and S. H. Grimmert are building it.

Louis Hicks & Son are making ready to open a garage in Fargo, N. D. They will handle the Halladay cars.

The C. F. Jackson Co., Norwalk, O., will have a new garage, to be built on South Hester street; it will be a brick structure.

The Campbell Auto Co., Fort Dodge, Ia., which maintained a branch in Des Moines, has removed its principal office to the latter city.

George S. Brewer, Athol Center, Mass., has embarked in the automobile business and is erecting a garage; it will be placed in commission in the spring.

Broadbrooks & Werner, Attica, Ind., have leased the Toms property, on Main street, for garage purposes. They will erect an addition to the present building.

A new garage, to cost about \$10,000, is being erected at the corner of Adams and Dot streets by Frank R. Buchholz, in Green Bay, Wis. It will be 40x100 feet.

The Wilder Motor Co. has opened a garage with all modern improvements in Grand Rapids, Minn. It is the third automobile concern to open up in the village.

The Randolph (Vt.) Inn Garage was destroyed by fire on the 6th inst., together with three cars stored therein. The cause of the fire is unknown; the loss was \$1,200; uninsured.

The Straeffer-Arterburn Motor Car Co. has been formed in Louisville, Ky., and has taken temporary quarters in 1103 East Broadway. It is handling the Parry and Krit cars.

A. B. Bean, a hardware dealer in Pocatello, Idaho, is building a garage at the corner of West Center street and Grand avenue. He will handle the Thomas, Ford and Buick cars.

F. C. Wilbur & Co. is the new name over the door at 1233 Michigan avenue, Chicago, Ill., where Metz cars will be handled. F. C. Wilbur, the head of the firm, hails from Waukegan, Wis.

Nicholas Zuzulin, Minot, N. D., an enterprising local smithy, has had plans drawn for a building to be erected at Fourth and Ward streets, which will be used partly for garage purposes.

Douglas Darby, of Westfield, N. J., has bought the property now occupied by Quackenbush's garage. In company with George W. Frederick he will continue the automobile business.

The Bender Garage Co., Utica, N. Y., a new concern, has opened a garage at Elizabeth street and Park avenue. Among the cars which it represents are the Stoddard-Dayton and Hupmobile.

The Western Automobile Co., with temporary quarters in the Newlander building

on West avenue, has been organized in Holdrege, Neb. It will distribute Velie cars in the adjacent territory.

The Gramm-Logan Motor Sales Co., Kansas City, Mo., has been established at 3328 Main street, under the management of L. B. Solether. It will be a southwestern distributing base for Gramm-Logan trucks.

John F. Fleming, of Brookline, Mass., has bought a site on Washington street near the Brookline transfer station, comprising some 10,600 square feet and intends to erect a large garage on the property.

J. R. Tate, Manitou, Col., has purchased a lot on Manitou avenue on which he will erect a garage. The structure will be of brick, two stories in front and one in the rear, and will be the home of the Victor car.

L. E. Parker, of Aurora, Ill., has opened a general repair shop for automobiles and bicycles in his home town at 88 Main street. He was for a time mechanical inspector at the engine factory, at Goshen, Ind.

Lawrence & Stanley's garage, Columbia Road and Hancock street, Dorchester, Mass., was destroyed by fire last week. The blaze started in the early morning, and but a few of the many cars in storage were saved.

Exclusively for the housing of electrics, the Toledo Auto and Garage Co. is erecting an addition, 80x220 feet, to its present garage. Five expert electricians have been engaged by the company to attend to the new department.

Gage & Sullivan, Le Roy, N. Y., who conduct a plumbing establishment, have purchased of Charles S. Morris the garage connected with the Eagle Hotel. In addition to their new venture they will continue their plumbing business.

Backus & Hunt is the title of a new firm which has entered the automobile business in Waterbury, Conn. They will erect a garage on Main street and in addition to representing the Mitchell and Ford cars will conduct a livery business.

The O. M. Dale Co., Franklin, Pa., has leased the garage occupied by the Franklin Motor Co., and taken over the business of that concern. The new owners propose to remodel the establishment thoroughly and will install a charging plant for electrics.

George H. Stowe, who has been prominent in the Boston retail field, has been appointed sales manager of the Carl H. Page Co., the New York City distributors for Chalmers cars. His move from the Hub to the Metropolis takes place immediately.

The Sweet-Edwards Automobile Co., Omaha, Neb., is the possessor of a new garage recently completed on Farnam street, the local "automobile row." It was appropriately housewarmed last week, and is

considered one of the best appointed establishments in the city. The American, Moon and Parry constitute the line of cars handled.

The Jewell-Melbert Garage, Galveston, Tex., have increased their floor space to double its former size and now occupy the entire building at 2210-14 Mechanic street. Coincident with the acquisition of more "elbow" room much new equipment has been installed.

J. W. Reid, of Ottawa, Kan., has given up his position in the Peoples National Bank at that city, and removed to Kansas City, where he has gone into the automobile business. He has obtained the agency for the Glide and Westcott cars, which he is displaying at 720 East Fifteenth street.

The Southern Automobile Co. is the name of a new concern which has opened temporary quarters in Louisville, Ky., at 417 West Green street. The company is composed of W. H. Lansing, W. H. Montgomery and William A. Baker. At present it is handling the Broc electrics, Ohio gasoline cars, and the Acorn line of motor trucks.

E. A. Brown & Co., Paterson, N. J., have completed plans for the erection of a garage at 359-361 Market street. It will cover ground 66x188 feet and will be a one-story affair. One of the features of the new establishment will be separate locked stalls for cars, which are expected to prevent machines being taken out by unauthorized persons.

George W. Houk, who, after returning from several years of foreign experience in the automobile field, not long ago assumed charge of the Cadillac business of Alvan T. Fuller in Boston, Mass., has been made manager of the Olds-Oakland Co., of Boston, and will direct the sale of Olds and Oakland cars for all New England with the exception of Fairfield county, Connecticut. Louis J. Sackett succeeds Houk in the management of the Cadillac department of the Fuller business.

John M. Kirkwood, of Gotebo, Okla., has purchased the business of the Star Automobile Co., at 137 North Market street, Wichita, Kan. With the business and good will of the former owners, Houston, McGregor & Roberts, he gets the agency for the Overland and E-M-F. cars. He will be the Southwestern distributor for these two cars and will establish agencies throughout the Southwest.

L. H. Fawkes, of the Fawkes Automobile Co., has purchased two lots on Hennipin avenue, Minneapolis, Minn., and will erect thereon an electric garage and automobile warehouse. The building will be at the corner of Harmon place and extend 150x155 feet. It will be designed principally for the storing of electric vehicles of the Lowry Hill district and be equipped with the latest improvements for the recharging of batteries. Its cost will be \$45,000.

# The White Gasolene Car

## is equipped with a Four-Speed Transmission

Do not be satisfied with anything less than a four-speed transmission. Sooner or later, it will entirely supplant the three-speed transmission, just as the latter took the place of the two-speed transmission.

The four-speed transmission is used in practically all cars selling at \$4000 and over, but no other car selling at the White price—\$2,000—is thus equipped. The White is built with a four-speed transmission, because it makes it a better car than if only a three-speed transmission were used. This is typical of the **QUALITY** of every detail of the White car—for example, a “honeycomb” radiator is used, instead of the cheaper and less efficient tubular radiator; the frame is of crucible chrome-nickel steel, instead of the usual carbon steel; the leather in the upholstery is hand-buffed, instead of the cheaper and almost universally used machine-buffed leather; forty-two days are devoted to painting the car, instead of one-third or one-fourth of that time, etc., etc.

---

Write for a copy of our catalog, or, better yet, call on our nearest dealer, so that you may learn the many respects in which the construction of the White is better than ever before found in a car of moderate price.

---

### The A. A. A. and the Stock Car.

While the revised contest rules of the American Automobile Association make for distinct improvement it is regrettable that it was found inadvisable to eliminate the "freak car" or racing monster, the chief purposes of which have been to promote "barnstorming," to set up false standards and generally to undermine and cause belittlement of the bona fide stock car. The rules, or rather many rules evolved to define the latter suggests great travail and labor, and though any improvement is better than none, the fact that the new regulations permit practically everything except valves, frames and wheels to be altered or tinkered with, cannot but provoke smiles.

While changes in the valves have constituted one of the commonest forms of "faking" the stock car, boring out the cylinders has been an even more general offense, and as both are of the same order of deception, why the A. A. A. and the Manufacturers

Contest Association should disapprove of the one and countenance the other is not easily comprehended. Lacking other information, it would seem that rigid adherence to catalogued engine dimensions should be about the very first requirement of any definition of a stock car. The reason for placing a ban on adulterated or "doped" fuel is more readily understood, but as the so-called adulteration is the least of the evils and is within the reach of all, it is a fair question whether its prohibition is not an obstacle to desirable experimentation and a hindrance to discovery.

### Mounting Accessories on Cars.

Continued and rapid multiplication in the number of makes of cars on the market and also in the number of different styles of accessory fittings has resulted in a somewhat vexing state of affairs with regard to the mounting of such attachments. Despite the efforts of the accessory people to accommodate their products as uniformly as possible to the conditions existing on different machines, the fact remains that in many cases considerable work has to be done in order to so install a speedometer, wind shield or spare tire as to carry it on a car in a perfectly satisfactory manner.

The evil involved becomes apparent when the attachment is made at a garage or by the employes of the dealer when the entire range of conditions involved in the satisfactory working of the accessory is not invariably taken into account. Slipshod work, the marring of finish and even the drilling of holes in parts where the metal cannot be spared are apt to be the result. Nor is the tendency obviated by the general increase in the amount of equipment supplied by the maker with the stock product. For although a large proportion of the automobile manufacturers now include practically all that is essential to the operation of the vehicle in the regular purchase price, the fact remains that few cars go out of the retail store without one or two more or less important additions to or changes in the equipment.

That these added luxuries, as they are in many cases, frequently are a source of considerable annoyance to the operator is an unfortunate fact which not even the most consistent efforts of the accessory makers thus far have succeeded in obviating. Long since, it has been the custom of the car builders to iron their standard bodies for tops, whether the specifications

call for such equipment or not, and the evils which used to result from improperly constructed and attached lamp brackets now have been overcome to a large extent as well. But save in only one known instance, the makers have not yet come to take cognizance of the importance of providing for the mounting of other attachments. In the instance in question, the maker regularly provides for the careful and reliable installation of a speed indicating device, where the purchaser's specifications require it.

The obvious remedy which suggests itself for car designers to provide regularly for the mounting of speedometer driving gears on steering arms, to arrange brackets of standard form for the mounting of wind shields and other contrivances such as more commonly are used, thus reducing the labor involved in fitting them. The situation calls for the general adoption of certain conventions—for once to dodge the overworked term standardization—conventions of such a nature that the accessory people might work to them in designing attaching lugs and brackets and thus eliminate the burden which now rests upon the more considerate members of their class who are seeking to provide attachments suitable for every known make of car. Such a movement would require a greater amount of co-operation than now exists, but it would provide for so much better service on both sides of the field that it is likely little difficulty would be encountered in carrying the work along, were proper initial steps taken by one or another of the several organized bodies most interested.

### Professionalization of the Trade.

Of all the new A. A. A. rules, none strikes so severely home to the men in the trade as that which places each and all of them, without any distinction whatsoever, in the professional class of sportsmen.

To deny to any man who makes or sells a car, a tire, a chain or even a spark plug, the right to be considered an amateur and to make mere identification with any branch of the trade a badge of professionalism, is a radical, if not repulsive, move and one not easy to defend. Of course, it greatly simplifies the administration of the amateur regulations, but it is not fair nor just and the administrators of such rules have no right to evade responsibility and trouble by making a man's occupation the measure of his sportsmanship, when that occupation

does not consist of the pursuit of sport for the sake of pecuniary gain. The rule denying amateur registration to men identified in any way with the production or sale of cars, tires, spark plugs, or gaskets means that they cannot compete in the same class with even the members of their own club. They must compete with and as professionals or not engage in competition at all.

The full effect of this rule should be made widely known, for the Amateur Athletic Union of the United States having ruled that any person who competes for cash or with professionals, even in automobiles, thereby automatically becomes a professional, the man who so competes becomes a professional in all sports; and as amateurism is a condition of membership in the New York Athletic Club, the Chicago Athletic Club, the Detroit Athletic Club, and nearly all other high class athletic organizations, the man in the automobile or automobile accessory trades who, for mere love of the sport, engages in an automobile contest and the non-tradesman who competes with him, thereby will forfeit their memberships in those clubs.

The price which the new A. A. A. rule exacts is a high one and whether it will be relished by those whom it affects, and whether it will be permitted to remain, once its import generally is recognized, remains to be seen. There's as much merit in the new rule as there would be in one making the manufacturers and salesmen of dumbbells or running shoes professional athletes.

#### The Subject of Suspension.

Continued reflection upon the subject of automobile suspension systems is apt to lend color to the notion that in the use of either some liquid or of compressed air lies as good a way out of a serious difficulty as any. It is true that by comparison with older types the spring suspensions of the present day are almost wholly satisfactory. At the same time the aching bones of long-distance motorists, and the bent and broken parts of cars which have seen much road service attest that a great deal remains to be done in this as in other sorts of development before the truly satisfactory car shall have arrived on the scene.

Just now increasing stress is being laid upon the pneumatic suspension. The Olympia show of last fall afforded British motorists an opportunity to view a system of the sort which was rendered particularly in-

teresting by reason of the fact that it provided automatic compensation for alterations in the loading of the vehicle. Two or three years ago a system was brought out in this country in which the work of the springs was reinforced by a set of pneumatic cushions interposed between the springs and the axles. At the present time it is known that at least two systems of pneumatic suspension are under experimental test here, in neither of which are springs employed. The summary of an extended treatise on the subject from still another inventor, an Englishman, which is printed elsewhere in this issue, focusses attention upon his cause just now.

While the use of air and also of liquids has become thoroughly familiar as applied in spring dampening and shock absorbing devices, their use as a substitute for springs or as a direct auxiliary to them remains to be thoroughly investigated. Although mechanical obstacles arise when the precise method of applying either of these two mediums is considered, the extreme flexibility and mobility which they share in common, as well as the almost perfect elasticity of the air, leads to the belief that the principle involved in applying them is a correct one. Indeed, the excellence of the pneumatic tire itself is sufficient guarantee in the case of air to furnish a fine basis for investigation and invention.

Like all other problems incident to the design of the motor vehicle, spring suspension embraces much involved theory and necessitates a bewildering amount of compromise. As engineers are becoming more familiar with the purposes of the various elements entering into the complete machine it is becoming possible to isolate the various parts to such a degree that their work can be studied independently to some extent. One time this was done with disastrous effect. But that was before the day of the unit power plant, the axle mounted transmission and the interchangeable body. Better understanding of what is involved now renders it possible to design the individual units in a measure independent of one another and yet to have them go together and work together harmoniously. The same progress in automobile knowledge is destined to be of great benefit in perfecting the successful suspension system. And the logical advantages of the pneumatic and hydraulic systems, singly or in combination, would seem to indicate that they may receive successful attention.

## COMING EVENTS

February 21-28, Omaha, Neb.—Omaha and Council Bluffs Automobile Dealers' show.

February 24-March 3, Toronto, Can.—Ontario Motor League's show in St. Lawrence Arena.

February 28-March 5, Kansas City, Mo.—Kansas City Automobile Dealers Association's fourth annual show in Convention Hall.

March 1-5, Sioux City, Ia.—Sioux City Automobile Club's first annual show in Auditorium.

March 5, New York City—Annual New York-Boston midwinter endurance run for Perlman trophy.

March 5-12, Boston, Mass.—Boston Automobile Dealers Association's eighth annual show in Mechanics Building.

March 5-12, Cleveland, O.—Cleveland Automobile Club's eighth annual show in Central Armory.

March 5-12, Des Moines, Ia.—Des Moines Automobile Dealers Association's first annual show in Coliseum.

March 12-19, Syracuse, N. Y.—Syracuse Automobile Dealers Association's annual show in State Armory.

March 17-19, Louisville, Ky.—Louisville Automobile Dealers Association's annual show in Armory.

March 19, Altadena, Cal.—Annual Pasadena-Altadena hill climb.

March 20, San Francisco, Cal.—San Francisco Motor Club's hill climb on Nineteenth avenue hill.

March 21-26, Indianapolis, Ind.—Indianapolis Automobile Trade Association's first annual show.

March 26-April 2, Montreal, Can.—Fourth National Automobile and Sportsmen's show.

March 26-April 2, Pittsburg, Pa.—Pittsburg Automobile Dealers' Association's annual show in Duquesne Garden.

March 28-29, Savannah, Ga.—Savannah Automobile Club's 675 miles endurance run to Jacksonville, Fla.

April 8-17, Los Angeles, Cal.—Inaugural meet on the new Los Angeles Motordrome.

April 23-29, Bangor, Me.—Eastern Maine automobile and motor boat show in Auditorium.

June 1, Berlin, Germany.—Start of Prince Henry tour, finishing at Homburg on 8th.

June 11, Wilkes-Barre, Pa.—Wilkes-Barre Automobile Club's annual hill climb on Giant's Despair, Wilkes-Barre Mountain.

July 2, Wildwood, N. J.—North Wildwood Automobile Club's roadability run from Philadelphia to Wildwood.

July 4, Wildwood, N. J.—North Wildwood Automobile Club's annual beach races meet on Ocean drive.

**BUILDING THE FIRST BOARD TRACK**

**Work on Los Angeles's Mile Course Well Advanced—Will be Ready for Opening Meet on April 8th.**

With a force of 100 men working daily, the one mile board track near Los Angeles, Cal., is assuming definite shape, and is expected to be completed by March 25th, in order to allow the drivers who will com-

being put up at Los Angeles. Prince, who has built more board bicycle tracks than any two men living or dead, already had constructed two motorcycle tracks, one at Los Angeles, which measures  $3\frac{1}{2}$  laps to the mile; the other, 3 laps, at Springfield, Mass., upon which all the world's records have been broken. The latter track is a true circle, and Prince reasoned that a similar track, built especially for automobile racing, would surpass any other automobile race course in the world.

house the men and teams that are required for the construction work.

The surface of the track, which will measure 5,281 feet in circumference, three feet from the pole, will be composed of 2x4 inch strips laid on edge. At the pole, where the first supports are located, the posts are 2 feet 10 inches apart, with a cross piece in between for additional strength. The track is banked to 18 degrees all around, and the width will be 45 feet, with a running board 30 feet wide for

CONSTRUCTION OF THE TRACK SUFFICIENTLY ADVANCED TO SHOW THE STRAIGHT LINE EFFECT IN THE GRADUAL CURVE

pete at the first meeting on April 8th, ample time to accustom themselves to driving around a saucer banked to 18 degrees all the way around. It will be the first track of the sort ever constructed and its use will be followed with almost absorbing interest.

The progress in automobile track construction within the last few years has been remarkable. Less than five years ago one mile dirt tracks, and even half mile ovals were the only courses available for automobile racing. The first specially constructed automobile course was the famous Brooklands track, at Weymouth, England; it is constructed of cement and is over two miles in circumference. Last summer the Indianapolis Speedway was completed, but before it was opened to the public, work already had started upon a similar course at Atlanta, Ga. The Indianapolis speedway was surfaced with crushed rock and cement, which afterwards was replaced with brick paving. The course is  $3\frac{1}{2}$  miles around. The Atlanta track, also banked, measures two miles.

It remained for Jack Prince, however, to secure sufficient financial backing to erect a mile board track—the one that now is

The course is situated about a mile and one-half from Playa del Rey, a short ride on the Los Angeles Pacific line from Los Angeles. More than a million feet of lumber is on the ground, and big army tents

starting purposes. For night racing the track will be lighted by 70 arc lamps of 4,000 candlepower each, placed 40 feet high, and overhanging the track.

Three cemented subways will connect the arena parking space with the outside, two of these being for machines and the other for pedestrians. Seating arrangements for 20,000 persons have been planned, the covered box seats on the homestretch side accommodating 3,000, the remaining 17,000 to be taken care of in bleachers located on the north side of the saucer. C. S. Warner's electrical timing system will be installed in time for the opening meet.

The opening meet will last from April 8th to 17th, dates having been arranged with the American Automobile Association for April 8, 9, 10, 13, 15, 16 and 17, a 24-hours race on April 30 and May 1, and again for May 29, 30 and 31, July 2, 3 and 4, and on Labor Day.

The program for the first week's racing is an extensive one, consisting of 37 events, and in variety for all classes of cars as recognized by the contest board of the American Automobile Association. The longest events will be 100 miles—four in number—for that number of classes of cars,

VIEW FROM THE TOP OF THE BANK

and a two hours race for stock chassis, 600 cubic inches piston displacement. According to the program for the first meet 30 silver trophies will be awarded, besides \$6,575 in 53 cash prizes. The richest first prize will be a trophy and \$1,000 in gold to the winner of the 100 miles race for cars between 451 and 600 cubic inches piston displacement.

The Los Angeles Motordrome will be controlled by the Los Angeles Motordrome Co., which has been incorporated for \$250,000. F. E. Moskovics, who formed the company, has been elected vice-president and treasurer; H. G. Feraud, secretary, and R. A. Rowan, Henry Keller, Fred Flint and Harry Lombard, directors. Frank A. Garbutt will be the president.

#### Californians' Easy "Endurance" Run.

What undoubtedly was the easiest contest ever held in California was the second annual "endurance run" of the Automobile Dealers' Association of California, held on Sunday, February 18th. The run comprised 200 miles of roads between San Francisco and Oakland, with an hour for lunch-eon at the latter place.

Ten hours were allowed for the trip, with two and one-half minutes leeway at each end of the trip. Of the fourteen starters but two failed to finish the easy run within scheduled time. The Haynes car, driven by E. P. Eppinger, was penalized 21 points for crossing the finishing line at the Oakland control 21 minutes ahead of time, while a Brush runabout, in charge of W. H. Richards, lost points for not making the course in time. The latter made the course in good shape and but for losing the road near Oakland would have come in with a perfect score.

Last year when the run was held the roads were in terrible condition, so that the contest was dubbed a "mud plug." It had been expected that the same conditions would prevail this year, but the contrary proved the case. But for a short stretch of highway in San Mateo county, the roads were all that could be desired. In fact, the only disagreeable feature of the occasion was the dust.

Just why there were so few starters the promoters are at a loss to explain. The event had been well advertised and it was expected that at least half a hundred dealers or private owners would be anxious to put their 1910 machines through their paces. Contrary to expectations, however, only fourteen persons put in appearance at the starting point at Van Ness and Golden Gate avenues, and all but two of that number earned perfect scores, as follows:

W. M. McDonald, Hupmobile; E. G. Sewart, Crawford; Ivan DeJungh, Velie; William Powers, Buick; Frank Murray, Buick; John H. Engal, Studebaker; Al. Whitehead, Corbin; Walter C. Morris, Autocar; Wagner Reniff Motor Car Co., Auburn; Standard Motor Car Co., Ford and Paterson.

## MARCH MEET FOR FLORIDA BEACH

### Oldfield, De Palma and Robertson Named as Probable Race Contenders—Tardy Announcement of the Plans.

There will be an automobile racing carnival upon the Florida beach this season, according to a belated announcement from the Florida East Coast Automobile Association, which has most of its members and a clubhouse at Daytona, Fla. It will take place on Tuesday, Wednesday and Thursday, March 22, 23 and 24, and T. E. Fitzgerald, secretary of the local club and publisher of the only daily paper in Daytona, will manage the affair.

For the reason that no announcement had been made until within a few days ago, it was supposed that the Florida club would "pass up" the annual meet this year. Had it not been for the motorcycle and bicycle contests of last year's carnival that would have proved a dismal failure. At that time it was stated that the next carnival would take the form of a general sports meeting, with automobile racing as only one of the features, and that W. J. Morgan, who has managed all previous meetings upon the beach, would be in charge. It is apparent that Morgan and the Florida East Coast Automobile Association could not come to a financial agreement.

Whether the proposed meet will be successful or not is problematical, with the chances that it will not. Local owners of stock cars may arise to the occasion with sufficient entries to fill the events, but in the absence of sufficient well known drivers and speedy cars, the carnival is apt to encounter a severe frost, and frost in Florida has been known to do more damage than to ruin the orange crop.

Although the proposed meet is less than a month distant, Barney Oldfield is the only driver of renown that has signified his intention of competing. It was announced that Ralph DePalma's 200 h.p. Fiat will be among the contestants, but this has been denied, as DePalma contemplates driving the big car at Los Angeles. Fred Shaw, who has been batonstorming with Oldfield on the Southern circuit, was expected to enter, but Shaw broke his leg in two places and suffered other injuries last week while driving a racing car over the roads from New York to Springfield, Mass. Shaw, of course, will not be there.

George Robertson, of national fame, also has been spoken of as a likely contender against Oldfield, and if he decides to have another try at the Florida beach records, some of which he already holds, he will pilot Walter Christie's car. The entries of just Robertson and Oldfield will not make the meet one of international, or even national importance, however. The promoters have hopes of securing additional entries

between now and March 22d. The date for closing the entries is not stated.

#### Lowell to Promote no More Races.

Two attempts to make it pay expenses having proven unsuccessful, it is likely that the Lowell (Mass.) road race will be abandoned as the business men of the city who have been appealed to to give financial assistance to the project, with vivid recollections of the two previous deficits, have failed to develop any enthusiasm for a third running of the affair. Although conceded to be a great success from a sporting standpoint, the Lowell carnival on both occasions of its running has been a white elephant financially and the liquidating of the expenses of the first race nearly swamped its promoters. John O. Heinze, of the Lowell Automobile Club, was the founder of the race and worked untiringly to make it a success, but the financial handicap has proven too great for him to overcome.

#### To Require Mirrors on Covered Vehicles.

While some manufacturers have anticipated ordinances calling for the fitting of mirrors in front of the driver of limousines and landaulets, there is liable to be a sudden shortage in these mirrors in Los Angeles. The municipal authorities of that city have passed a drastic ordinance making it compulsory for the drivers of all covered vehicles, whether motor or horse driven, to fit their vehicles with mirrors, which will permit them to see behind them. The remarkable part of the ordinance is its application to horse-driven vehicles as well as to motor cars. Usually the automobile is discriminated against in traffic regulations, but in this case the older vehicles were treated with the same severity.

#### All-Connecticut's Ambitious Contest.

Should there be any residents of Connecticut who have not yet seen an automobile they will have ample opportunity to do so on May 19, 20 and 21, when the All-Connecticut endurance run of the Automobile Club of Hartford is held. Never has any commonwealth been so thoroughly explored by motor as will be the Nutmeg state on those days, for the gasoline caravan will pass through practically every one of the 168 cities and towns in the state. It is the most ambitious undertaking ever promoted by the Hartford club and calls for daily runs of over 200 miles, the total distance being 615 miles. Each day's run will start from and finish in Hartford.

#### Oklahomans Elect Officers.

The Oklahoma Automobile Association has elected the following officers for the ensuing year: A. O. Campbell, president; Guy E. Blackwelder, vice-president; C. H. Everest, treasurer; J. W. Densford, secretary, all of Oklahoma City. The association now has 130 members in the state, and according to Secretary Densford, will have 500 within the next few months.

# The Effort to Lift the White Man's Latest Burden

A. A. A's National Legislative Convention at Washington Proves a Notable Occasion, but Fate of Federal Registration Bill is in Doubt—Two Congressmen Deliver Stirring Speeches in its Favor; Some Others Cry "State Rights" and are Evasive.

In some respects the most remarkable feature of the national legislative convention of the American Automobile Association, held in Washington, D. C., on February 15, 16 and 17, was Allen M. Fletcher of the Automobile Club of Vermont. Presumably he was sent to the meeting because of belief that he was in sympathy with its purpose to promote uniform legislation and assist the passage of the pending Federal automobile registration bill; but instead of doing anything of the sort he lifted his voice to declare that "it is dangerous to advocate such a measure" as the bill in question. He thought that though "the constitution does confer the power to regulate interstate traffic" it "cannot be construed to mean that automobiles are as yet to be considered common carriers and as such subject to the laws under such a ruling." Later, however, Mr. Fletcher obtained an enlightenment which materially altered his views.

The convention was marked by considerable talk about "states rights" and by evasive and non-committal speeches by several members of Congress, but there were a few of the latter who did not hesitate to speak their minds and to declare their belief in the necessity for a Federal law such as the automobilists desire and in the justice and constitutionality of the measure.

Representative William G. Brantley of Georgia, a member of the Judiciary Committee of the House, and considered one of the ablest constitutional lawyers in that body, was of this number. His address was in striking contrast to that of the delegate of the Vermont automobile club and really was the feature of the convention; it aroused those present to a tumult of enthusiastic cheering and applause.

Representative Brantley opened his remarks with the statement that he is a states' rights man, and also a United States rights man, and that he believed that Congress had a right to pass any law it desired relative to the traffic of automobiles.

"Two years ago," he said, "the bill for a federal license was referred to the Judiciary Committee. Now it has been referred to the Committee on Interstate and Foreign Commerce. It occurs to me, in view of this reference of the bill, that some power must have determined that no constitutional question is involved in the proposed law, and in that I concur. As the states delegated the power of regulating in-

terstate commerce to the general government, it seems to me to be an additional reason as to its legality.

"The United States Supreme Court has held in the case of an interstate bridge that when citizens walked across that bridge they were engaged in interstate commerce, just as much as if they had crossed the bridge with their arms full of merchandise. And so when an automobile passes from one state into another it, too, is engaged in interstate commerce and can be regulated by the government.

"You say that Congress has the right to pass this law. I say to you that if that be true then the state regulations which impede interstate traffic of automobiles are unconstitutional.

"Whatever appeal you make to Congress," Mr. Brantley advised in concluding his address, "should be predicated upon the right of Congress not only to protect and regulate but also to restrain and properly control the growing commerce of the country."

The convention, which was held in the red room of the New Willard Hotel, was called to order by President Lewis R. Speare, of the American Automobile Association, who, after outlining its purpose and pleading for legislation that would enable automobilists to go from state to state without becoming lawbreakers, surrendered the chair to Charles Thaddeus Terry, of New York, chairman of the A. A. A. Legislative Board. John Bancroft, of Delaware, acted as secretary. In taking the chair, Mr. Terry delivered an address that, as usual, was logical, vigorous, clear headed and to the point.

"We are here in the cause of a Federal registration bill and to raise our voices," he said, "against the provincialism of some states, in placing laws on their statute books which, in my mind, unlawfully and unjustly tax the automobilist; but we are also advocating the good roads question. That means more tourists, and more tourists mean a greater following in our cause."

He then clearly pointed out the features of the Federal bill, laying stress on the fact that it did not interfere with the police powers of the states but, while relieving a great and growing class of citizens of intolerable interference with their right of travel, yet answered the one great question, that of identification. "States rights" was the specious structure behind which the states hid, "and yet," said Mr. Terry, "all that the

automobilists ask for is the same rights that are accorded the man with a horse and buggy. As citizens of the United States we believe we are entitled to them.

"If we are really a nation, if this whole country belongs to us, if there are certain rights which every citizen of this country may exercise, then the right of free and unrestricted intercourse by any vehicle which is lawfully upon the highways is one of such rights."

Chauncey M. Depew, the venerable Senator from New York, was the first of the regularly listed speakers. He first dealt with ancient history and with statistics of the automobile industry, showing its growth and present importance, and then reached the heart of the subject.

He said:

"Two interesting questions have arisen by this enormous expansion of the automobile. One is intrastate and the other is interstate. Nothing which has occurred in recent years has done so much to stimulate an interest in good roads.

"But the compelling question now is legislation. Not only the railroads but the users of the railroads have found that the only way in which they could escape intolerable conditions which interrupted travel was to get under the wing of the national government.

"An automobilist starts from New York for Washington, and New Jersey, Pennsylvania, Delaware, Maryland and the District of Columbia each halts him for a license or tax, and the journey becomes intolerable.

"It is not the mission of this convention, as I understand it, to interfere with the laws of the states or with local communities. It is the business of the automobile associations in the several states to see after their state laws and their local regulations. But the hope of this convention, with delegates from all the states, is to secure, as has been done for the boats traveling on inland waters and crossing state lines and for continental railroads, a federal recognition which will permit free and unobstructed travel across state lines. It is not for the government to interfere with state regulations upon purely intrastate travel. As it is now, the tourist finds that every state has different regulations and different restrictions, and what is permitted in one state is a crime in another.

"It is entirely within the constitution for Congress to enact a law by which there

can be a federal license. In that law can be placed such safeguards as to the marking and identification of the machine as will make its identity known to the local officials wherever it may go. Under such license the industry, which has grown so rapidly, would grow more rapidly; the machines would become cheaper; they would become less a luxury and more a necessity, and a new bond would still closer bind the different sections of our country."

After Senator Depew came Senator Robert M. Taylor of Tennessee, who declared that he was a state's right man, cracked a few jokes, "hurrahed" for good roads and then bowed himself out. The man who followed Taylor, however, was of a different sort. He was Representative Burke, of Pennsylvania, whose address shared honors with that of Representative Brantley, delivered the next day.

Mr. Burke arraigned the states for perverting the purposes of the constitution by "enacting laws which put everything at odds," and keep the people of the country further apart, rather than bring them closer together.

"Why are the states bound by one constitution?" asked Mr. Burke. "Is it not to form a more perfect union and to work in better harmony with one another?"

Enthusiastic applause greeted his announcement that he was among those "who believe that no government, town, city, state or national, has the right to impose a tax upon the owners of vehicles for the use of the highways.

"The highways belong to the community," he said, "and have so belonged from the first. Government has no right to impose a tax on the use of what is inherently the privilege of its citizens."

Representative Cocks of New York, who introduced the Federal registration bill, spoke in its favor, intermingled his remarks with good roads talk and a quasi-defense of Speaker Cannon.

Logan W. Page, director of the United States bureau of road inquiry, talked of roads of the future, and W. D. Sohler, a State Highway Commissioner from Massachusetts; Arthur T. Fifoot, representing the Secretary of State of Connecticut, and Gray Bailey, Secretary of State of Vermont, threw verbal bouquets at the automobile laws of their respective commonwealths. W. S. Schutz, of the Hartford (Conn.) Automobile Club, was the last speaker on the first day. He argued for an "honor system"—a higher standard of personal conduct on the part of owners and drivers and greater observance of public sentiment.

Representative Brantley's vigorous utterances constituted the feature of the second day's proceedings, although in point of personal prominence Hon. N. J. Batchelder, former Governor of New Hampshire and present master of the National Grange, was the most conspicuous figure. He said, among other things:

"The one subject above all others in

which the farmers of the country are vitally interested is that of replacing our alternately muddy and dusty trails, called by courtesy roads, with a system of permanently improved highways. The farmers have for a long time been trying to impress upon our national legislature the necessity for federal aid for road improvement. The coming of the automobile has had the effect of opening the eyes of the public to the inferior character of most of our roads, and if the enactment of a Federal registration law by making it easier for automobile owners to visit sections of the country hitherto unknown to them will aid in awakening public sentiment on this important question, it will be a valuable educational influence in favor of the policies of road improvement unanimously indorsed by the farmers of the entire country."

Other speakers were L. H. Kittredge, president of the National Association of Automobile Manufacturers; George Lyman Rogers, of Boston, counsel for the Metropolitan Park Board of that city; Osborne L. Yellot, of Maryland; William A. Thibodeau, of Boston, counsel for the Automobile Legal Association; S. Boyer Davis, of Philadelphia; Charles P. Allen, State Highway Commissioner of Colorado; James H. Wood, of New Jersey; I. C. White, of West Virginia; James T. Drought, of Wisconsin, and Major Richard Sylvester, superintendent of the District Police, who, among other things, stated that at the last convention of police chiefs each member was asked to contribute his ideas of fair and equitable automobile regulations.

After the speechmaking the following resolution, which had been drafted by a committee named by the chairman, was adopted:

"Whereas, There are 23 states having general motor vehicle statutes, no two of which are alike, and the provisions of which are so dissimilar as to create confusion, and are unwarranted to users of motor vehicles engaged in interstate travel; and

"Whereas, The conditions of the highways in the various states are not so dissimilar but that a motor vehicle law, adequate for the protection of the traveling public in one state would be equally adequate in another state; therefore, be it

"Resolved, That it is the sense of this convention that the motor vehicle laws of the various states should be made uniform; and that all the energies and influences which can be legitimately brought to bear should be exercised persistently to accomplish the enactment in each state of the uniform law, which has been the subject of consideration and discussion at this convention.

"Whereas, The bill providing for Federal registration of motor vehicles, known as H. R. 5176, introduced by William W. Cocks, of New York, and now pending before the Committee on Interstate and Foreign Commerce of the House of Representatives, meets the approval of all who have given the matter careful considera-

tion and the prompt enactment of such a law is necessary for the unhampered development of interstate commerce and travel by motor vehicles;

"And since it is only through Federal legislation that the unjust and unwarranted burdens now imposed upon such interstate commerce and travel can be removed; be it

"Resolved, That the national legislative convention of the American Automobile Association held in Washington February 15 to 17, 1910, does urge the speedy passage of this measure and hereby pledges itself to use every honorable effort to accomplish its enactment."

The committee which drafted the resolution was as follows: James T. Dought, of Wisconsin, chairman; Theodore H. Curtis, of Kentucky; L. H. Kittredge, of Ohio; Joseph H. Woods, of New Jersey; Dr. William P. Richardson, of New York; Dr. A. B. Heyl, of Ohio; Walter S. Schutz, of Connecticut; Frank C. Battey, of Georgia; A. M. Fletcher, of Vermont; Robert F. Hooper, of Pennsylvania; S. L. Haynes, of Massachusetts; Dr. C. B. Brown, of Oregon; George S. Walker, of Wyoming; the Hon. Neal Brown, of Wisconsin, and T. Edward Bryan, of Florida.

The third and last day of the convention (Thursday) was devoted to a hearing on the Federal bill before the House Committee on Interstate and Foreign Commerce, which at first appeared hostile, some of its members being doubtful as to the constitutionality of such a law on account of its supposed interference with the police powers of some of the states and because they suspected it would be the means of decreasing the state revenues, at the close of Mr. Terry's argument, and as a result of private conversations subsequent to the hearing, they showed particular interest in a proposition that the funds derived from federal registration should go to the Good Roads Bureau of the Department of Agriculture and should be returned to the various states for good roads purposes under such conditions as Congress should direct.

The argument before the committee was presented by Messrs. Spear, Terry and Neal Brown, the latter representing the Automobile Association of Wisconsin. Mr. Terry bore the brunt of the fray and was made the target for a volley of questions. Chairman Mann of the House committee asked Mr. Terry why, if the states interfered with automobilists under other than their police powers or were unjust in the exercise of those powers, the motorists did not take the matter into the state courts. Mr. Terry replied that in such an event the same cases would have to be fought out all over the country and that a federal registration law would clear up the whole situation at once. Mr. Terry held that Congress had as much right to pass an interstate automobile act as it had to control water traffic, but the chairman disagreed with the lawyer on that point.

The main purpose of the bill, declared Mr. Terry, was identification. It would clear up that vexatious question, he said, and would be a real assistance, more especially to state officers in charge of the public highways.

"Aside from what you term the principle of the thing, as regards your rights as a citizen and the constitutional privilege to travel where you will throughout the country, the mere payment of the fee demanded by the state does not matter so much, does it?" inquired Mr. Mann.

"No," replied Mr. Terry; "it is our rights and privileges that we are jealous of, and every time we must stop and procure an additional license we feel that we are humiliated in this respect."

Mr. Mann, however, questioned whether Congress has the authority to enact a law which should grant one man the privilege of interstate travel dependent upon his having complied with the laws of a single state, as provided in the bill.

Representative Bartlett, of Georgia, asked how much revenue the government would derive from a Federal license, and Mr. Terry showed that it would bring more than \$1,000,000 a year into the national treasury, as there are more than 350,000 machines in use at the present time, and the tax would hardly be less than \$5.

Representative Richardson, of Alabama, asked many questions of Messrs. Spere Terry and Brown, the three speakers, among them being whether a bureau would have to be created to handle the license business.

"We are perfectly satisfied that the matter be handled by the Agricultural Department," said Mr. Terry. "Mr. Page, of that department, has taken great interest in our work, and we do not know of any department that we would rather trust the matter to than the one over which he exercises supervision."

Later in the day the delegates visited Secretary of Agriculture Wilson, who listened to them attentively, but like a true bureaucrat he would not commit himself to the measure.

Edward S. Cornell, the secretary and "jockey" who rides Banker Henry Clews's little hobby, the so-called National Highway Protective Society, arrived in Washington on the last day of the proceedings and managed to get himself quoted in print as being opposed to the Cocks bill. He thinks if it is enacted, only an officer of the United States will have power to arrest an offending automobilist.

#### Virginia Raises Registration Fees.

The Virginia Legislature has amended the state's automobile law by increasing the registration fees, which hereafter will be imposed on a horsepower basis—\$5 up to 20 horsepower, \$10 from 20 to 45 horsepower, and \$20 above 45 horsepower. Non-residents are exempted for a period of 15 days.

## "QUEERING" THE NEGRO DRIVER

The Process Lands Three Men in Jail on Charges of Malicious Mischief—How They "Fixed" a Car.

That not only colored chauffeurs, but the men who employ them, are made the victims of malicious attentions from white drivers, as pointed out by the Motor World some time ago, again has been made unpleasantly evident by a charge which has been brought against three men by Lorillard Spencer, Jr., of New York City, for "malicious mischief" to Spencer's automobile. The arrest of the trio followed the presentation of evidence to the District Attorney showing to what lengths white chauffeurs will go to prevent the employment of a negro in a driving capacity.

Last week Spencer, who keeps his car at the Sagamore Garage, sent a negro in his employ to the garage with some new cushions. As the negro was working about the place some of the men in the garage asked him if he was going to be Spencer's chauffeur. He told them in a joking way that he was, and that, according to Spencer, started the trouble.

The next time there was occasion to use the car it was found that someone had put camphor in the gasoline tank, sand in the carburetter and one of the magneto wires was cut.

The three men locked up were Howard Ray, Robert Morse and George Reynolds. The last two named were arraigned before Magistrate Krotel in the Tombs police court and were held in \$1,000 bail for examination.

#### Joint Ownership Causes Trouble.

License tag No. 905, swinging upon a motor car belonging jointly to two Philadelphians caused the owners no end of trouble the other day. Both of them were arrested fully eight times before the comedy of errors was played out.

The trouble was started when one of the partners in the machine saw it standing in Market street unattended. He took it, unaware that his partner was in a moving picture show.

After the pictures were over, the first partner in the car came out and found it missing. Being unable to locate the car, he went to the City Hall police station and reported it as stolen. A short time after the "flyer" had been sent out a reserve policeman saw the fatal No. 905 on a motor car. He stopped the driver, and despite his protestations that he was part owner of the machine he was taken to the City Hall, where he said he was John Seraphin, Jr., of Front street, near Girard avenue.

It happened that Seraphin's partner, Max Strehle, of Sixth street, near Thompson, was still at the City Hall station, and when

he saw Seraphin explanations were made and the two men permitted to go. In front of the Garrick theater another policeman spotted the license tag. He took the occupants of the car to the City Hall for a second time. After being brought back seven times, the police lieutenant finally sent a policeman along with the car to see that it reached the garage, where it was kept without further trouble.

#### New Jersey Almost Part of Union.

After strong opposition the Edge bill introduced in the lower branch of the New Jersey legislature, permitting non-residents to use the roads in that state for three five-day periods in any one year without a license, was passed by the House by a large majority last week. The measure went through in amended form, the original provision of ten days periods being reduced to five to mollify the faction who opposed it. Carrying the approval of the lower branch the bill now is before the Senate for action and it is expected that strong opposition will be encountered there, especially from that peculiar individual, Senator Frelinghuysen, who, as expected, has given notice that he will endeavor to kill the measure as he has on former occasions throttled favorable automobile legislation.

#### To Provide More Jobs in New Jersey.

In the New Jersey legislature bills have been introduced to increase the number of paid motor vehicle inspectors or hold-up men from 20 to 60 and to increase the salaries of both the Commissioner of Motor Vehicles and the chief inspector. An advocate of this lovely little game naively explains that "the increase in license fees and fines will easily pay for these increases." Another bill that is pending proposes to allow cities to regulate and license "carriages and other vehicles" and to apply the receipts to street repairs. It is supposed to have been inspired by the Newark authorities who are anxious to shake more dollars out of the motorists' pockets.

#### More Work for Murray of Oklahoma.

The Oklahoma legislature is wrestling with an automobile bill which provides for speed limits ranging from 6 to 15 miles per hour. One of the local correspondents explains that "Bill Murray killed a similar bill in the first legislature by securing the insertion of an amendment requiring the autoist to stop his machine and offer a ciew of tobacco to every farmer he passed."

#### To Lighten Burden in Kentucky.

Representative Moore has introduced a bill into the Kentucky legislature which fixes a registration fee of \$2 on automobiles and exempts non-residents on a reciprocal basis. The speed limits range from 10 to 20 miles per hour. At present local registration is the rule in the state and the new measure, if passed, will afford much relief.

**"DOMESTIC EXPRESS" A NEW TYPE**

**White Produces a Light Tray Body for General Utility—Is Demountable and Ings that are Effected.**

Realizing the usefulness of a properly constituted automobile for light merchandise haulage as well as the transportation of passengers, not a few attempts have been made to produce a general utility car. One of the most pleasing results yet achieved in that direction is a new version of the White gasoline car, which just has been brought out and which is styled the "domestic express." Unlike many efforts at

WHITE FITTED WITH "DOMESTIC EXPRESS" BODY

mixing pleasure and business features in a single vehicle, the result in this instance is far from inharmonious in either of its phases, while it is equally effective in both forms.

The "domestic express" is a light tray body, built after the approved form of all express wagons, with outside stiffening molding and hinged tail board. As its name implies, it is purposed for the domiciliary uses of the private owner in hauling luggage to and from the depot, bringing home the Sunday dinner and transporting discarded furniture to the homes of poor relations. In this capacity it is capable of receiving a very respectable load and carrying it with all the safety which is necessitated where the freight is of human instead of inanimate form.

In its ordinary guise the vehicle is the White small tonneau pleasure car. The rear portion of the vehicle is made in demountable form; therefore it is a work of simple functions, requiring only a few minutes' time and little labor to lift off the tonneau and replace it with the express body. As the work for which the express body is designed ordinarily is of only an occasional nature, it is thought that it will fill the proverbial long felt want, since it is distinctly different from any system yet produced with similar intent.

**Thinning Oil With Gasolene.**

Frequent admonition is given against the use of gasolene for thinning out lubricating oil during cold weather, although the ob-

jection to its use usually is given incorrectly. While it is true that the rapid evaporation of the gasolene tends to render it only a temporary palliative of the evil which it is intended to eliminate, the real objection to its presence in lubricants is that upon evaporating it leaves a fine whitish precipitate behind it. This accumulates upon the bearing surfaces and prevents the uniform distribution of the oil, which is essential to proper lubrication.

**Converting an Engine to Air Cooling.**

A method of converting a water-cooled engine to air-cooling, which is said to have worked out very satisfactorily in British practice, is to drill a considerable number of small holes through the outer jacket

walls, tapping the jackets at their lowest points for pipe leads of  $1\frac{1}{2}$  to 2 inches diameter. The pipes which are connected at these points are led into an ejector, formed in the manner of the steam actuated device of the same name with an interior jet through which the engine exhaust is carried. The suction developed in this way is sufficient to cause a strong blast of air to play upon the cylinders through the openings in the jackets. In addition to this natural circulation, the combustion heads are packed with a compound consisting mainly of salt, which is designed to assist in the conduction of the high heat at those points to less important ones, where the surplus can be radiated without difficulty, in addition to the radiation necessary for the latter themselves.

**Claims the Farthest North Honors.**

Assertions that two motor trucks which are in use in Helsingfors, Finland, represent the "farthest north" in automobiling, is disputed by the makers of the Franklin motor car. Helsingfors is close to the 60th parallel of latitude, and five degrees farther north they say a Franklin is in regular operation, running between Fairbanks and Fox, in Alaska. This is almost in the Arctic circle, and with the mercury 40 degrees below zero the Franklin is in daily use. It is driven by a six-cylinder engine of 42 horsepower; its owner is H. H. Ross. The normal temperature at which the car is compelled to run is 72 degrees below the freezing point.

**MOTOR TRUCKS SUPPLANT CARRIERS**

**Native Burden Bearers in East Africa Give Way to Automobiles—Enormous Savings that are Effected.**

East Africa now boasts a long-distance motor truck express service, inaugurated by English and German capitalists who for the purpose have formed the Anglo-German Auto Transportation Co., with a capital of \$25,000. Main offices of the company are located in Berlin, while the East African management is in the hands of the German-English East Africa Co. with headquarters at Voi, a station on the Uganda railroad system.

Located about 100 miles west of Voi is the town Moschi, a very important trade center in the Kilimandjaro district. Fully 400,000 pounds of merchandise is transported between these places every month on the backs of carriers who average a load of 60 pounds. Horses and other domestic animals are of no use as the insect pests and a peculiar cattle disease kill off the majority of horses and oxen. The motor truck is now entering the field and first reports are full of enthusiasm for the innovation.

Trucks of 40 horsepower and a carrying capacity of five metric tons are being used; they make the trip in two days, as compared to the carrier's six days. One day's rest at each station is allowed for the purpose of unloading, reloading, making adjustments, etc., so that between 50 and 60 round trips per year can be made with each truck.

The great economic value of this introduction of motor trucks into this labor-poor country lies not only in the carrying of goods at quicker pace and lower cost, but in the return of 183 carriers (this being the capacity of each truck) to really productive agricultural work.

A comparison of the cost of transporting products from Moschi to Voi shows the great advantage of the motor truck over old methods.

By carriers—Time for one trip, 6 days; carrying capacity 60 pounds; cost per load of 60 pounds, \$2.05.

By motor truck—Time for one trip, 2 days; carrying capacity 11,000 pounds; cost per load of 60 pounds, \$1.40.

This motor truck will carry the combined loads of 183 carriers in one-third of the time at a clear saving of \$118.95 for every trip.

**Work of Washington's Police Wagon.**

During the first 86 days of its service the Washington (D. C.) police wagon—a Franklin—responded to 346 calls from patrol boxes and made 113 miscellaneous runs, covering a total distance of 467 miles. The average time per run was 6½ minutes.

## Local Show Epidemic Reaches Its Height

GENERAL VIEW OF NEWARK SHOW IN ESSEX TROOP ARMORY

### 64 Exhibits and Some Moving Pictures at Newark.

A big brewery motor truck in brilliant red and a shining white automobile ambulance provide the chief elements in the "commercial section" of an otherwise well balanced automobile show at Newark, N. J., which this week is holding forth in the Essex Troop armory, where some 120 individual cars are on display. Just near enough to New York City to be familiar with metropolitan examples in automobile shows, but just far enough away to be quite individual and independent, Newark this year has surpassed its two previous annual exhibitions in the present offering, which opened its doors on Saturday night, 19th inst., and closes on the 26th.

While the armory is a good big place, the car exhibits not only take up all the big drill floor but have climbed the stairs into the galleries, where they elbow the accessory exhibits in a bullying way. There is comparatively little "gingerbread" in the decorative lay-out, the scheme being based on plenty of incandescent lights and an

arrangement of blue and gold bunting in broad bands from the middle ceiling to the sides.

For the cognoscenti, who by reason of trade or motor club affiliations have the privilege of admission, there is a reception room set aside, and into its sacred precincts an astonishing number of men find their way, there to linger between occasional tours of inspection. The place also is the center of many conferences with visiting motorists and automobile club representatives who are being instructed as to their duties in helping to secure better motor legislation for the state.

A measure of ceremonial dignity was thrown about the opening of the show on Saturday night by the sudden turning on of all the lights at 8 o'clock, and a few speeches, Colonel Austen Colgate, personal aide to Governor Fort, being the principal speaker. A report of his speech was given in the Newark newspapers on Sunday morning, for the benefit of those of

the visitors present who were curious to learn what he said.

As a sideshow feature an aviation section has been placed in a room off one of the galleries, but the Saturday night crowd could not find it. Later the management explained that the motor birds are so delicate that it was feared they might suffer in the opening night crush and that therefore the opening of the aviation section had been postponed until Monday night, when a lecture and moving pictures of some flights would be provided.

Not the least boast of the show management is that every car and accessory was in place before the opening. The show, which is managed by Horace A. Bonnell, is given by the New Jersey Automobile Exhibition Company, composed of members of the New Jersey Automobile and Motor Club and the New Jersey Automobile Trade Association. There are 64 exhibitors, of whom about 40 stage cars, while the others show accessories and specialties in great

variety. The list of exhibitors is as follows:

Gasolene cars—The Autocar Co., Autocar; Alexander Brunner, Klinekar; Buick Motor Co., Buick; Detroit-Cadillac Motor Car Co., Cadillac; Ellis Motor Car Co., Pierce-Arrow; Essex Automobile Co., Brush, Ford and Jackson; Essex County Overland Co., Marion and Overland; J. S. Gray, Schacht; Green Motor Car Co., Locomobile and Mercer; H. J. Koehler Co., Koehler, Everitt "30" and Rider-Lewis; Linkrum Automobile Co., Lozier and Oldsmobile; F. L. C. Martin Co., Rapid, Mitchell and Hupmobile; J. W. Mason, Columbia and Maxwell; J. J. Meyer, Auburn; Midland New York Co., Midland; Newark Auto & Engineering Co., Rambler; New Jersey Auto-

mobile Co., Moline; O'Neil Motor Car Co., Paterson "30"; Packard Motor Car Co., Packard; Paddock-Zusi Motor Car Co., Chalmers; Peerless Motor Car Co., of New York, Peerless; J. M. Quimby & Co., Simplex, Isotta and Pennsylvania; A. E. Ranney, Hudson; Rickey Machine Co., Marmon and Pullman; A. G. Spalding & Bros., Stevens-Duryea and E-M-F.; Sultan Motor Co., Sultan; Terry Automobile Co., Palmer-Singer; Union Motor Car Co., Reo, Krit, and Premier; Weldon & Bauer Co., National; The Woolsten Co., Oakland; R. D. Norton, Pickard and De Tamble; Crescent Automobile Co., Mack trucks; The Auto Exchange, used cars; The J. H. Deppeler Agency, Ellis-Tonnele Co., George F. Lit-

tle, G. F. G. Motorcycles—Frank C. Cornish, Yale; Watson J. Kluczek, Harley-Davidson.

Accessories—Auto Wind Shield Co., Empire Auto Supply Co., Essex Storage Battery & Repair Co., Honk Mfg. Co., National Oil Supply Co., N. Y. Auto Top & Supply Co., N. J. Auto Top Mfg. Co., Norben Oil & Supply Co., Nugget Polish Co. of N. Y., Ltd.; Recometre Co. of America, The Rubber Shop, Standard Oil Co., Valve Seating Tool Co., August Buermann, Consolidated Optical Mfg. Co., D. B. Dunham & Son. Electrical Maintenance & Repair Co., H. J. Koehler Co., Martin Auto Co., W. S. Shepard, Wayne Sales Co., Westen Mfg. Co. Henry Meyers.

### "Promenade" a Feature of the Cleveland Show.

Despite the fact that a white collar when worn in Cleveland, O., stays white from fifteen minutes to two hours and a half, according to whether the wind is from Newberg or the Lake, a scheme of white decorations is employed in the automobile show which opened on Saturday, 19th inst., at Central armory, and which continues throughout this week. At any rate, the decorations were white on Saturday, no matter how somber they may be before the show closes, when the soft coal smoke from the city's many industries has had opportunity to exert its customary and besmirching effect on the surroundings.

Not only exhibiting a bold daring in attempting to use white, the Cleveland promoters have gone further and have provided a sort of Atlantic City boardwalk effect for promenaders at the show, where they may walk back and forth, gazing and flirting, without disturbing the regular course of real business. The "promenade" is a bridge-like structure extending from the balcony to a "reviewing stand" raised above the main floor, and is supported by white pil-

lars and decorated with illuminated arches. Then, too, there is a restaurant at the show, an innovation at Cleveland motor car exhibitions, which economical escorts of young ladies look upon with much disfavor.

Although the car exhibitors number but 27, there are 66 different makes represented, while the 27 accessory exhibitors present the products of a legion of makers. Furthermore, there is quite a sizable motorcycle section, displaying the products of ten factories. Noteworthy in connection with the accessory displays is the number of local concerns newly branching out in automobile side lines.

The list of exhibitors is as follows:

Gasolene cars—Winton Motor Carriage Co., Winton; White Co., White; Simplex Motor Car Co., American Simplex; Sterling Motor Sales Co., Sterling; F. B. Stearns Co., Stearns; Standard Automobile Co., Packard; Studebaker Automobile Co., Studebaker; Royal Tourist Car Co., Royal Tourist; Peerless Motor Car Co., Peerless; Harry S. Moore, Stoddard-Dayton, National and Courier; H. R. Hoffman Automobile

Co., Locomobile; Gaeth Automobile Co., Gaeth; Ford Motor Co., Ford; Chisholm-Phillips Co., Stevens-Duryea; Auto Bug Co., Auto Bug; Cleveland E-M-F. Co., E-M-F. and Flanders; Chadwick Co., Chadwick; Derain Motor Car Co.

Electric vehicles—Applebaum Bros., Detroit; Baker Motor Vehicle Co., Baker; Rauch & Lang Carriage Co., R. & L.; Studebaker Automobile Co., Studebaker.

Steam cars—The White Co., White.

Accessories—Booth Demountable Rim Co., Atlantic Refining Co., Cleveland Vacuum Machine Co., Cleveland Chain Mfg. Co., Casino Cycle & Supply Co., Carburation Co., Domestic Vacuum Cleaner Co., Falls Rubber Co., Hall Storage Battery Co., Inst Lighter Co., W. A. King, K. W. Ignition Co., Charles E. Miller, National Refining Co., Perfection Spring Co., Pennsylvania Rubber Supply Co., James F. Patton, Rogers-Thomas-Dodd Co., Standard Oil Co., Star Rubber Co., M. Strauss, Thompson Mfg. Co., Universal Sales Co., Westinghouse Electric & Mfg. Co., Allis-Chalmers Co.

### Three Native Cars Make Their Appearance at Minneapolis.

On the registers of the hotels in Minneapolis, Minn., last Saturday night were the names of scores of visitors from Minnesota, Iowa, Wisconsin, North and South Dakota, Montana and Western Canada, drawn to the city by the third annual automobile show which opened in the National Guard armory on the 19th inst., and which continues until the 26th. These visitors, together with the Minneapolis and St. Paul contingent, made a whaling big crowd for the opening, and things were at high pressure from the start, with all the jamming, pushing, struggling and excitement around the individual exhibits that marks a successful show.

Formalities were omitted in the opening of the exhibition and the ticket takers were at their post early in the day, even while some of the tardy exhibits were being hurried in. At 2 o'clock in the afternoon the

lights were turned on and the musical program was set going, putting the show in full blast.

Of car exhibitors there are over 40, many of them staging three or four makes, so that the visitors who have paid substantial sums in railroad fare in order to attend are well repaid in the extent of the display which is presented to them. The main floor stages the pleasure cars, with the accessories in the gallery and the commercial vehicles and motorcycles in the basement.

Four flaming arc lamps supplement the illumination supplied by myriad strings of incandescents radiating from the center of the ceiling to the side walls, and streamers of colored bunting have been used with profusion. Vaudeville entertainment is provided in the ball room of the armory, and the main musical program in addition to having a stirring military band is marked

by numerous vocal numbers.

The exhibits include a number of the show cars which were on display at Chicago, but two or three newcomers, indigenous to the Northwest, are disclosed, including the product of Moore Brothers, of Wimbledon, N. D., the Luverne, which is made by the Luverne Automobile Co., of Luverne, Minn., and the Starr runabout, which is turned out by the Starr Motor Car Co., of Minneapolis—a four-cylinder 20 horsepower model at \$1,000, and a 30 horsepower "six" at \$1,500.

The accessory jobbing interests resident in Minneapolis assist in providing an exceptionally complete accessory display, while the several motorcycles that are represented afford the show the distinction of a motorcycle section. The car exhibitors are as follows:

Gasolene cars—Pence Automobile Co.,

Buick, Oldsmobile, Oakland; Mich-Stair Automobile Co., Overland and Knox; Columbus Buggy Co., Mora and Firestone-Columbus; Northwesterns Auto Co., Ford; Deere & Webber Co., Velie; Tri-State Automobile Co., Inter-State and Paige-Detroit; Haynes Automobile Co., Pennsylvania and Regal; Fawkes Auto Co., Matheson, Marmon, Reo and American; Royal Auto Co., Royal Tourist and Glide; W. H. McIntyre Co., McIntyre; Maxwell-Briscoe Co., Maxwell; Hathaway-Stimpson Co., Hupmobile; Heany Automobile Co., Halladay; Robertson Motor Co., Franklin; Barclay Auto Co., Chalmers, Thomas and Hudson; Joy Bros., Packard; Winton Motor Carriage Co., Winton; Maytag-Mason Co., Maytag and Ma-

son; Northland Motor Car Co., Stoddard-Dayton, Courier and Falcar; Kemp Bros. Automobile Co., Brush; Victoria Motor Car Co., Pullman; T. M. Anderson, Peerless and Pope-Hartford; Ranger Auto Co., Auburn; Warren-Detroit Co., Warren-Detroit; White Garage, White; Northwestern Stearns Co., Stearns; H. E. Wilcox Motor Car Co., Wilcox; Ramaley Auto Co., National; Great Northern Implement Co., Whiting and Ohio; Northwestern Cadillac Co., Cadillac; Luverne Auto Co., Luverne; P. J. Downs Co., Rambler; MacArthur-Zollars Co., Everitt "30," Corbin, Anhut, American Simplex and Black-Crow; Moore Carving Machine Co., Elmore; Moore Bros., Moore; Pierce-Racine Co., Pierce-Racine; Schur-

meier Motor Car Co., Schurmeier; Starr Motor Car Co., Starr; Goosman & Johnson E-M-F. Co., E-M-F., Speedwell and Flanders; Minneapolis Motor & Truck Co., Minneapolis; International Harvester Co., International; Twin City Motor Co.

Electric vehicles—Columbus Buggy Co., Columbus; Electric Vehicle Co., Detroit; Robertson Motor Co., Baker; Electric Carriage & Battery Co., R. & L.; MacArthur-Zollars Co., Babcock; Moore Carving Machine Co., Woods.

Motorcycles—Eagle Motor Works, Eagle; Yale Motorcycle Co., Yale; Ira Enmark; Excelsior; Hammer & Bisset, Indian; Edwards Cycle Co., Wagner, Merkel, Light, New Era and Racycle.

## Omaha's Show Its Biggest and the "Best Ever."

Garnished with some of the finery borrowed from the recent Madison Square Garden show in New York City, the fifth annual show of the Omaha Automobile Dealers' Association opened in the Auditorium in the Gate City on Monday, 21st inst. It is the largest show, as well as the most pretentious, which Omaha has yet produced. For, because of the recent addition of nine new names to the roster of the dealers' association, special accommodations had to be prepared for the increased number of space holders. Even so, at the last moment, the floor plans had to be replotted in order to make room for the late comers. Even after the stage had been removed, the commercial exhibits, six in number, had to be staged in the basement.

A peculiar characteristic of the locality is the large proportion of implement houses now engaged in marketing automobiles. Omaha has 31 such concerns, and nearly all of them are representatives of one or more lines of cars. In the light of the immense strength of the farmer market just now, this fact is not without significance. The total number of exhibitors is 40, and the number of different makes of motor vehicle displayed, 78. Sixty-four of these are pleasure cars of the gasoline type, mostly the well-known standard makes, which are familiar to the visitor at either of the recent national shows. Seven varieties of electric vehicle are on the floor and two different makes of steam car. As in former years, the number of accessory displays is relatively small, amounting to only half a dozen in all.

Cars which are on view and which are new to shows at this time, are the Mason, which is one of the standbys of the Western trade and which is made in two-cylinder opposed form with a 24 horsepower engine; the Wilcox, and the Avery, both of the latter being commercial machines. The Avery is particularly in its element, being designed for tractor and power production purposes on the farm, and is of peculiar interest to Iowa and Nebraska visitors.

A couple of real live air-ships grace the Auditorium, to which New York and the Omaha show of last year have added a distinctly festive air. The real spice or "occasion" of the affair, however, is rendered by the consecration of the several evenings to different purposes, which are programmed thus:

Tuesday—Council Bluffs night, band concert. Wednesday—South Omaha night, band concert; Thursday Night—Society night, band concert. Friday Night—Lincoln night, band concert. Saturday Night—Band concert; close of show.

The exhibitors and their wares are as follows:

Gasolene cars—Apperson Sales Agency, Apperson; Avery Co., tractors; Bergers Automobile Co., E-M-F. and Flanders; Capron-Wright Auto Co., Speedwell and Moline; J. I. Case Plow Co., Ohio; Coit Automobile Co., Rambler and Mitchell; J. J. Deright Co., Locomobile, Matheson, Stoddard-Dayton and Regal; Drummond Carriage & Auto Co., White; Electric Garage Co., Packard; Ford Motor Co., Ford; H. E. Frederickson Automobile Co., Hudson, Chal-

mers, Pierce-Arrow and Thomas; Freeland Bros. & Ashley, Mason, Midland and Maytag; W. L. Huffman Automobile Co., Inter-State, De Tangle, Anhut and Hupmobile; R. R. Kimball, Stevens-Duryea and Cadillac; Kissel Automobile Co., Kisselkar; Brick P. Kuhn, Duer; Lininger Implement Co., Oakland, Gleason, Staver and Welch; C. F. Louk, Marmon, Haynes, Falcar, Halladay and Empire; Maxwell-Briscoe-Omaha Co., Maxwell; Mid-West Auto Co., Cole "30"; Andrew Murphy & Sons, Frayer-Miller and Randolph trucks; Nebraska Buick Automobile Co., Oldsmobile and Buick; T. G. Northwall Co., Brush; Olds Gas Engine Power Co., Reliance trucks; Omaha Motor Car Co., Cartercar; Omaha Automobile Co., Auburn and Rider-Lewis; Guy L. Smith, Franklin and Peerless; Standard Automobile Co., National, Badger and Standard Six; Sweet-Edwards Automobile Co., Moon, American and Parry; Van Brunt Automobile Co., Pope-Hartford, Overland and Marmon; Velie Automobile Co., Velie, Columbus and Wilcox trucks; Wallace Automobile Co., Stearns; Western Automobile Co., Schacht and Great Western.

Steam cars—Drummond Carriage & Auto Co., White; R. R. Kimball, Stanley.

Electric vehicles—J. J. Deright Co., Waverley; Drummond Carriage & Auto Co., Woods; Electric Garage Co., Baker, Detroit and R. & L.; R. R. Kimball, Babcock; Velie Automobile Co., Columbus.

Accessories—Baum Iron Co., Central Tire & Rubber Co., Omaha Rubber Co., Powell Supply Co., Standard Oil Co., Western Automobile Supply Co.

## Cincinnati Show Garbed in Green and with a Fountain.

Green as Cincinnati, O., may be in the giving of automobile shows, the only evidence of it that is manifested in its first attempt, now staged at the Music Hall, is in the color of the decorations, which include green carpets, palms, ferns and the like. A distinctly Cincinnati feature, however, is the Rookwood ceramic fountain from the nearby Rookwood potteries, an

artistic contribution such as no other motor show has been able to boast.

No little pride is taken in the fact that the show, which opened on Monday, 21st inst., and lasts the week through, presents no less than 15 models made in Cincinnati itself, including the Schacht, Ohio, Cino and Enger cars. There are 56 exhibitors, of whom 40 offer complete cars, while 13

present accessories and three put motorcycles on view. The car exhibitors altogether give representation to 63 different makes. The list of exhibitors is as follows:

Gasolene cars—Atlas Motor Car Co., Inter-State; Charles Behlen Sons Co., Brush, Maxwell and Columbia; Buckeye Motor Car Co., Parry; Cincinnati Automobile Co.,

Peerless and Pope-Hartford; Cincinnati E-M-F. Co., E-M-F. and Flanders; Citizens Motor Car Co., Packard; Covington Auto Co., Cole "30"; Crown Auto Co., Cadillac; Robert C. Crowthers, Elmore and Reliance trucks; L. C. Dennison, Winton; Lowe Emerson, Staver; Enger Motor Car Co., Enger; Franklin Automobile Co., Franklin; Ford Motor Car Co., Ford; Garford Motor Truck Co., Garford trucks; J. K. Gilchrist, Demotcar and Detroit-Dearborn; Haberer & Co., Cino; Hanauer Automobile Co., Pierce-Arrow, Corbin, Jackson and Locomobile; Heilman Auto Co., Haynes and Cartecar; Herald-Reo Co., Reo; Herschede Motor Car Co., Courier, Stoddard-Dayton and Rapid trucks; Ohio Motor Car

Co., Ohio; Jungclas Auto Co., Mitchell and Palmer-Singer; Leyman-Buick Co., Buick; Oskamp Auto Supply Co., Lexington; Middleby Auto Co., Middleby; George C. Miller Sons Carriage Co., Stevens-Duryea; Olds-Oakland Co., Oldsmobile and Oakland; Payne Motor Car Co., Thomas; J. H. Ratliff Auto Co., Chalmers and Hudson; Schacht Mfg. Co., Schacht; Charles Schiear Motor Car Co., Hupmobile, Velie, National and Warren-Detroit; Schumacher, Boye & Eames, Knox; Smith-Eggers Co., Stearns; Speedwell Motor Car Co., Speedwell; J. S. Stevens, Matheson; Suburban Auto & Garage Co., Overland, Marion and Marmon; U. S. Motor Truck Co., U. S. trucks.

Electric vehicles—Charles Behlen Sons Co., Bailey; Welland-Pope Co., Columbus; Herschede Motor Car Co., R. & L.; Jungclas Auto Co., Baker.

Motorcycles—Bumiller-Reemelin Co., Indian Milton Motorcycle Co., Thor, New Era and H-D; Ferd Stenger, Merkel, Pierce, R-S.

Accessories—Auto Jack Distributing Co., Avondale Auto Supply Co., Louis E. Bedinger, Coughlin & Davis, Hill & Bowman, Metal Stamping Co., Oskamp Auto Supply Co., Paragon Refining Co., Peerless Buggy Top Co., Sheldon Axle Co., Standard Oil Co., Warner Pole & Top Co., Toe Water Auto Supply Co., Bumiller-Reemelin Co.

## Grand Rapids's First Effort Uncovers a New Commercial.

Representing the culmination of several years of effort on the part of local motorists, Grand Rapids, Mich., held its first automobile show during the latter part of last week, the initial function, which was staged under the auspices of the dealers and a local paper, opening on Wednesday, 16th, and closing on the 19th. Held in Klingman Furniture Exhibition building the show had 27 exhibitors of whom 20 displayed cars. About the only new thing in evidence was the four wheel drive commercial wagon manufactured by the Duplex-Power Car Co., of Charlotte.

So well and favorably were the show committee impressed with some of the decorations used at the Detroit show that they acquired them for their own exhibition, and transplanted embellishments comprising over one-third of a mile of electrical festoons. These festoons bearing thousands of ground glass incandescent bulbs were strung along the aisles and in the booths.

From floor to ceiling the walls were lined with red, white and blue bunting, and dotted with shields of American flags. The ceiling was concealed by a mass of apple green bunting in the center of which shone a huge electric dome. To further carry out the outdoor scheme, banks of palms and high bay trees were placed about the hall while baskets of autumn leaves and spring roses were placed on the standards which were in green and white bunting. In the balcony a myriad of potted plants converted the section into a veritable palm garden.

There were some 85 different cars shown, the main floor being given over to their display while the accessory stands were located in the balcony.

The exhibitors were as follows:

Gasolene cars—Austin Automobile Co., Austin; Adams & Hart, Regal and Franklin; Buick Motor Co., Buick; W. S. Farrant, Chalmers and Hudson; Maxwell-Moran Co., Maxwell; Pantlind & Bulkeley, Oldsmobile;

W. D. Vandecar, Reo; Enos & Bradfield, Jackson and Fuller; C. J. Bronson, Stevens-Duryea; Becker Auto Co., Ford; Stanley A. Dwight, Velie and Everitt "30"; Central Auto Co., Cadillac; White Motor Car Co., White; W. J. Doughty, Hupmobile; D. C. Riekse Auto Co., Cartecar; Oswald Automobile Co., Kisselkar; John Vlasblom, Mitchell; Riley Automobile Co., E-M-F. and Flanders; Duplex-Power Car Co., Duplex four wheel drive; International Harvester Co., International; Smith Automobile Co., Great Smith.

Electric vehicles—Adams & Hart, R. & L.; C. J. Bronson, Detroit; Central Auto Co., Waverley; Oswald Automobile Co., Baker.

Motorcycles—Heth Bros., Excelsior; Joseph Poisson, Indian and Harley-Davidson.

Accessories—Power Co., W. L. Eckhard, Dick Brink estate, Maxwell-Moran Auto Co., Pantlind & Bulkeley, Grand Rapids Electric Co.

## 33 Brands of Car and a "Conservatory Effect" at Portland.

Mustering 23 exhibitors, of whom 19 display cars, the fifth annual automobile show in Portland, Me., was launched in the Auditorium on Monday, 21st inst., and will remain in commission throughout the week, and as becomes all things pertaining to an industry which has made such remarkable strides in its short career the present motor exhibition surpasses all previous functions of its kind which have been staged in the metropolis of the Pine Tree State.

Likewise in the matter of decorations have previous efforts been outdone. The central figure in the embellishment gives to the interior a resemblance of an immense conservatory. From the top of the building is suspended a huge net in which is

placed a large and varied assortment of flowers and leaves, and the pleasing effect is enhanced considerably by the skillful arrangement of the lighting accoutrements. Carpets are laid in the spaces, the aisles being defined by the bare floors and all stands are marked by uniform signs. Palms and rubber plants also are scattered about in profusion. The 33 makes of car displayed are nearly all of standard pattern.

Those exhibiting are the following:

Gasolene cars: Mank-Stuart Motor Co., Cadillac; Spear Auto Co., Ford; Buick Motor Car Co., Buick; Frank F. Wentworth, Overland and Marion; Taxicab Co. of Maine, Palmer-Singer; Bullock-Goodwin Co., Studebaker; L. C. Gilson Co., Mitchell

and Premier; Portland Motor Mart, Interstate, Speedwell, Regal and White; Maine Motor Carriage Co., Peerless, Stevens-Duryea, Pope-Hartford, E-M-F., and Flanders; Pine Tree Auto Co., Velie; W. A. Paterson, Paterson; Augusta Auto Station, Winton; F. R. Parker, Elmore; Stoughton-Folkins Co., Maxwell, Rambler, Oldsmobile and Oakland; F. A. Nickerson Co., Selden and Pierce-Arrow; W. L. Russell Co., Apperson; Merle F. Burgess, Reo; Fuller Auto Co., Fuller and Warren-Detroit; Portland Co., Knox.

Accessories—Spear Auto Co., L. C. Gilson Co., James Bailey Co., Underhay Oil Co., Frank M. Low Co., Darling Automobile Co.

## Salt Lake City's Initial Show Proves a Creditable One.

Marking the debut of an automobile show within the borders of the Mormon state, the first annual show of the Salt Lake City (Utah) Automobile Association was official-

ly inaugurated in the Auditorium by Mayor Bransford on Saturday night, 19th inst., with 26 exhibitors. It was a most auspicious occasion in the motoring annals of the

Mormon capital and the future of the exhibition seems well assured. Of the exhibitors 14 belong to the class showing cars, 4 stage motorcycles and bicycles, and

the remainder are assembled under the accessories banner.

Never before in its history has the interior of the big hall been so prettily decorated as for the present occasion, over \$2,000 being expended on this item alone. The ceiling is a bank of blue and white bunting, studded with colored electric globes, and the four walls also are swathed in the same material. Red burlap is laid over the entire floor. In the booth arrangement custom is departed from somewhat, these being oblong in shape, with heavy corner pillars giving a fence effect. The pillars are crowned with large palms surmounted by colored globes. While demonstrations, especially show demonstrations, have ceased to figure to such an ex-

tent as formerly, they nevertheless still prevail to some degree, and in this connection there was imposed on the exhibitors an unusual restriction, forbidding them to give demonstrations from the building, and requiring that they be given from their respective salesrooms. The show will close on Saturday, 26th.

The following are the exhibitors:

Gasolene cars—Sharman Auto Co., Stoddard-Dayton, Maxwell and Reo; Tom Botterill Auto Co., Pierce-Arrow, Chalmers, Hudson and Pope-Hartford; Randall-Dodd Auto Co., Thomas, Buick and Overman; Consolidated Wagon & Machine Co., Franklin, Overland and Velie; Gilmer Auto Co., American; Utah Motor Car Co., Cadillac; Evans, Hewes & Evans, Standard Six;

Studebaker Bros., Studebaker-Garford; Carl Horst, Winton; Raymond-Bracken Auto Co., Premier, Jackson and Chadwick; The Motor Co., Moon; Taxicab & Auto Co., Cartercar; White-Savage Co.

Electric vehicles—Sharman Auto Co., Woods; Utah Implement Vehicle Co., Columbus; Studebaker Bros., Studebaker; A. C. Whitmore, Baker and Waverley.

Motorcycles—Mrs. A. L. Carter, Indian; Bicycle Supply Co., Excelsior; Meredith Bicycle Co., Merkel and N. S. U.; Schettler Motorcycle Co.

Accessories—Bertram Motor Supply Co., Salt Lake Hardware Co., Western Electric Co., V. M. Scroggs, Monarch Motor Co., Miskin Wheel Co., Automobile Oil Co.

## Mrs. Foote a Feature of Binghamton's First Display.

This year, for the first time, Binghamton, N. Y., has a place on the local show circuit, its initial effort being staged in the state armory under the combined auspices of the Binghamton Automobile Association and Chamber of Commerce. It opened on Monday, 14th inst., and is booked to run the entire week. There are 38 exhibitors, 20 of whom stage cars.

Lending an up-to-the-minute tone to the exhibition is a Curtiss aeroplane, also there are several displays of bicycles, which latter give refutation to the commonly accepted libel that they have passed from this earth. There also is a more or less historical display of old motor cars. Despite the inclement weather on the opening night the building was well filled throughout the evening and the attendance has continued

strong on the succeeding days. Somewhat unusual is the presence of a woman among the exhibitors in the person of Mrs. D. E. Foote, who represents the Detroit electric.

The list of exhibitors and their wares is as follows:

Gasolene cars—W. H. Wilcox, Marmon; H. B. Doherty Co., Cadillac and Peerless; Binghamton Motor Car Co., Buick, Pope-Hartford, Stevens-Duryea and Thomas; Davidge Motor Car Co., Pierce-Arrow; C. H. Worden, Pullman; Wilbur & June, Mitchell; I. S. Matthews, Sons, Cartercar; Amos-Pierce Automobile Co., Hudson, Chalmers and Lozier; Chenango Motor Sales Co., Overland, White, Marion and Speedwell; Stow Mfg. Co., Knox and Hupmobile; S. H. Lewis, Maxwell, Velie, Chase and Franklin; Gladding Stevens, Brush; F. E. Spawn,

Ford and Imperial; F. B. Pudd, Oldsmobile and Oakland; Binghamton Automobile Co., Packard; R. M. Johnson, Regal.

Electric vehicles—Mrs. Foote, Detroit; S. H. Lewis, Waverley; Champion Wagon Co., Champion; M. E. Dikeman, Babcock.

Motorcycles and bicycles—C. O. Wellman, Royal Pioneer and Curtiss; Waldron Drug Co., Iver-Johnson and Columbia; Frank T. Abbott, Rambler, Monarch, Magara, Messenger; Frank S. Bump Co., Indian; Reliance Motorcycle Co., Reliance; Carl Wright, Marvel; W. Brown, M-M.

Accessories—Binghamton Vulcanizing Co., L. J. Kingsley, Nelson, Jones Co., Standard Oil Co., John W. Frey, Frank S. Bump Co., Babcock, Hines & Underwood, Diamond Electric Co., Tiona Oil Co., N. H. Snow, Southern Tier Renovating Co.

## Washington Club Opposes Wheel Tax.

Without waiting for the decision of the case which Leroy Mark, a local motorist, has carried to the District Court of Appeals, W. S. Duvall, representing the Automobile Club of Washington (D. C.), appeared before the district commissioners on Friday last and urged the repeal of the wheel tax now imposed on automobilists—\$3 for two-seated cars and \$2 for each additional seat. Mr. Duval argued that the tax is unfair and illegal because the automobilists already pay a personal property tax.

## An Honest Man Found at Last.

Diogenes probably would have ended his quest for an honest man had he searched in Los Angeles, Cal. At any rate, Harry Olive, who sells Stoddard-Dayton cars in the Angel City, claims to have discovered the man whom the old Greek philosopher was looking for. He says the man's name is W. B. Haines, of 1064 West Seventh street, Los Angeles.

When Olive returned to his touring car, which he had left standing at the curb in Spring street, he found the two front lamps

smashed. He surveyed the damage and then gave vent to his feelings. While he was looking around for additional damage he espied a card stuck carefully into the top of the coil box.

The card contained the name of Haines and a note to the owner of the car which read:

"Backed into you and smashed your lamps. Sorry, but can't wait. Will pay you in full."

There is a sequel. Olive called on the man who smashed his lamps and refused to receive payment because he said it felt so good to find an honest man.

## Detroit's Magic Lures Publishers.

The magic of the word "automobile" when uttered in Detroit, and the readiness with which it draws dollars from their hiding place, will result in one, if not two, automobile publications being implanted in that city. R. M. Jaffray, of Toronto, who years ago was S. A. Miles's partner in the publishing business in Chicago, will "father" one of the papers, while E. E. Schwarzkopf, of New York, is threatening to go and do likewise.

## Paris Garage Must Pay Damages.

A damage suit brought by J. S. Strawbridge, of Philadelphia, Pa., against a Paris automobile company, from which he had hired a touring car, resulted in a verdict for \$14,000 against the company. The car was wrecked in an accident, owing to a faulty steering gear, and the plaintiff's legs were crushed. The great popularity of rented cars with a considerable proportion of Paris's population renders the decision one calculated to somewhat curtail the use of such machines. It is probable that in no other city in the world is such wide use made of rented cars.

## Heavy Fine for Drunken Chauffeur.

Reckless driving on the part of a Chicago taxicab chauffeur was responsible for his being haled into court last week on a charge of disorderly conduct and fined \$75 and costs. Judge Newcomer, before inflicting this heavy fine, said that there ought to be a special city ordinance permitting the infliction of severe punishment on any person found operating a taxicab or other automobile while under the influence of drink.

## HERE'S THE TURBINE FLY WHEEL

**It Acts as a Muffler, Too, and May Increase Engine Power 25 Per Cent.—How It Works.**

Motorists who have been worried on learning that the audible "cough" of the healthy gas engine denotes power going to waste, are in a fair way of having their anxiety relieved. In response to a yearning to increase the power by utilizing some of the energy which ordinarily is blown out through the tail pipe, the Turbine Auxiliary Muffler Co. has been organized in New York City to exploit a device after which it is named, and which is intended to extract from the waste products of the ordinary motor of the marine or automobile type an amount of extra power equivalent to one-quarter of that already being produced within the cylinders in the regular way.

As the marine form of turbine muffler was the first to be perfected, it happens that the invention was first disclosed last Saturday afternoon in Madison Square Garden at the opening of the motor boat show which is now current there. The automobile type, differing only slightly from the pattern now being exhibited, is soon to be ready for the market, however, the inventor and his associates confidently affirm.

Although the device fulfils the double function of power augments and muffler, the latter quality is said to have been something of an afterthought—more or less accidental, so to speak. The basic idea is one which has lured many inventors hitherto, and which in pure theory is so plausible that it already has been made the subject of considerable experimentation. The principle is merely that of directing the engine exhaust not into a muffler, but against the buckets of a turbine or impeller wheel where it will be relieved of its energy through the double influence of cooling and expansion.

In the system in question, which, so far as is known, is the first actually to be placed upon the market, a form of plain impulse wheel is used, which, despite the use of the name turbine, is minus the curved buckets and stationary vanes which usually are thought essential where the full reactionary effect of impulse and expansion are to be taken advantage of. Instead, a series of eight radial blades are formed on the periphery of a casting which replaces the ordinary fly wheel. The rotary member thus formed is encased in a closed housing, into which the exhaust is directed through a large manifold, the gases impinging upon the blades at right angles to their working faces. The outlet, which also is tangential to the rim of the rotor, is at the bottom of the casing, about 180 degrees away from the inlet. The outer casing is water jack-

eted, the circulation behind in series with the outlet from the cylinder jackets, in consequence of which the water reaches the "muffler" partially heated, so that the gases are not cooled so abruptly as to rob them of the energy which it is desired to impart to the wheel.

In connection with its action, the remarkable claim is made for the device that be-

### Demountable Rims for Trucks.

Having been applied so successfully to pleasure cars, demountable rims now are being extended to commercial vehicles as well, and their application in the latter field has developed special types to meet the

unusual requirements of motor trucks and delivery wagons. One of these, that already has seen many months of actual road service, is the Firestone truck tire demountable rim, which simplifies the process of removing and replacing tires to such an extent that these changes can be made by the driver on the road with only a few minutes' delay. As will be seen by the accompanying illustration, the tire is secured in the channel by the standard side-wire fastening, as in regular equipments. To the inner circumference of the rim is rivetted a bevel band, having a section cut out to allow it to fit over the plate on the rim of the wheel, to prevent creeping. A single-flanged rim is shrunk on the felloe of the wheel and the demountable rim is held in place by this flange on the inner side of the wheel and on the outer edge by two rings, the outer ring being maintained in place by twelve bolts and nuts, the bolts passing completely through the felloe. Comparatively infrequent as are the emergencies which make necessary or desirable the changing of motor truck tires on the road, the provision of a means for making such changes and the carrying of a spare tire on a demountable rim gives further certainty of steady and reliable commercial vehicle service.

sides assisting in turning the crank shaft through the impulse of the exhaust gases against the blades of the wheel, it exercises a distinct and helpful scavenging effect upon the cylinders. Such is the design, it is said, that under ordinary circumstances the

pressure of the exhaust is effective only a portion of the stroke, after which the rotor in its casing acts as a suction pump to draw the remaining contents out of the cylinder, thus rendering the exhaust more effective than otherwise would be the case. The muffling function is wholly incidental to the process of robbing the exhaust of its energy and rendering it practically inert as well as reasonably cool.

In the automobile type the general construction is practically the same as in the form shown attached to a marine motor, save that the parts will be considerably lighter. Tests already made on the block are said to have shown an increase in power of 25 per cent. and more over the output of the same engine run under the conditions of ordinary muffling. More complete data as to the performance of the system is promised as soon as the project has matured a little more fully.

### More "Revolutionizers" in Prospect.

Four-cycle and two-cycle engines are a present day reality, and the six-cycle has been proposed with a rather fanciful idea that the addition of two idle strokes to the cycle would afford sufficient gain from scavenging the cylinders to compensate for the extended interval of non power production. It remained for a newspaper reporter down in Texas and an English inventor to achieve the "one-cycle," however. The former has not been heard from since his first announcement of the discovery of a local genius with a new style automobile engine concealed in his back shop. The over-seas contributor to lingual confusion, is at work upon a double-acting engine which is really a version of the two-cycle principle known under a novel and misleading name. Two cylinders arranged tandem are used for compressing and firing the charges, respectively; both being double acting. Through an ingenious arrangement of ports, both cylinders are rendered valveless, while the two-stroke cycle of action above and below the working piston renders the motor capable of exerting an impulse for every stroke.

### Traps to Prevent Clouded Sight-feeds.

Clouding of the glasses in an individual sight-feed lubricating system is attributed to the occasional backing up into the glasses of smoke from the crank case. According to the idea of a foreign expert, this may result when the feed is temporarily checked, or when the drops are fed so far apart that the tubing which leads to the bearings may become practically empty during the intervals. To obviate the difficulty and keep the glasses perfectly clean at all times he suggests that small U-bends be put in the feed pipes at some point where they are horizontal. This will form a series of small traps, which will be kept filled with oil at all times and thus will prevent the back rush of any gases which may accumulate in the case.

# A. A. A. Completes Revision of Contest Rules

Stock Cars Can be Altered and Yet Remain Stock Cars, but Use of Adulterated Fuel is Prohibited—All Drivers Must Register but No Man in the Industry Can be an Amateur—Many Notable Improvements.

After several months of close application, the American Automobile Association finally has completed the overhauling of its contest rules and the revised regulations have been formally approved by the Manufacturers Contest Association. A digest of the principal changes effected was made public this week; it gives evidence that heads and hands which have had long experience with sports were brought to bear in the work of revision—experience which heretofore has been sadly lacking in A. A. A. affairs of the sort.

Much time was spent in improving the definition of a "stock car" and while the new definition undoubtedly is better than the old one, the fact that it still permits cylinders to be bored out, and allows practically everything except valves, frames and wheels to be altered at will, makes the improvement in the definition more apparent than real. The use of "dope" or adulterated fuel is very sternly prohibited, but the A. A. A. could not bring itself to eliminate the "freak cars" of abnormal proportions and power, which permit four or five men to "barnstorm" the country, and which overshadow and make the performances of bona fide stock cars suffer by comparison. The new rules, however, make better provision for the supervision and tabulation of records and for the suppression of "phony" or unofficial records.

What is in many respects the most important and far-reaching innovation is the requirement that racing drivers shall be registered and tracks licensed, the registration certificates and licenses to be renewed annually; of little less importance, and even more radical, is the addition to the amateur rule which absolutely denies any person in any way connected with the automobile or accessory trades the right to be considered or classed as an amateur.

The digest of the new rules as given out by the A. A. A. is as follows:

**Status of "Stock Car" and "Stock Chassis"**—To insure the competition of bona fide stock cars, manufacturers are required to file with the Contest Board a complete description of their various "stock" models intended for competition, their status as stock cars being based on the ratio which the quantity production of the individual model bears to the total annual output of the maker, as given in the table. Promoters will be furnished by the Contest Board with copies of these official descriptions, and cars when examined by technical committees throughout the country must conform to such description to be eligible to start in any stock car or stock chassis event.

**Stock Car**—"A motor car, the complete description of which, upon the official blank provided for the purpose, has been filed with the main office of the Technical Committee of the Contest Board at least thirty days prior to the date of the contest entered, the quantity production of which bears to the total yearly production of its manufacturer the ratio set forth in the following table, and which is on sale through the regular selling representatives of the manufacturer."

Official blanks for stock car description may be obtained from the Chairman of the Contest Board, 437 Fifth Avenue, New York City.

Computation in connection with the following table shall be based upon a period of time from July 1st to June 30th of the following year.

In computing the annual output of a manufacturer, no account shall be taken of his production of taxicabs, delivery wagons or other vehicles designed for commercial use.

At the discretion of the Contest Board any competitor may be required to file a bond of \$5,000 that the entry made by him is a bona fide stock car within the meaning of this definition:

Total Output.	Percentage.	Number of Same Model.
10,000 cars or more	4.5% equaling	450 cars minimum
8,000 cars to 9,999	5.0% equaling	400 cars minimum
6,000 cars to 7,999	6.0% equaling	360 cars minimum
4,000 cars to 5,999	7.0% equaling	280 cars minimum
2,000 cars to 3,999	8.0% equaling	160 cars minimum
1,000 cars to 1,999	9.0% equaling	90 cars minimum
500 cars to 999	10.0% equaling	50 cars minimum
250 cars to 499	16.0% equaling	40 cars minimum
100 cars to 249	30.0% equaling	30 cars minimum
50 cars to 99	50.0% equaling	25 cars minimum

**Explanation**—Percentages are calculated on actual total output. For example: If the total annual output of a manufacturer is 2,500 cars, at least 8 per cent. of said output, or 200 cars, must be of the same model in order to constitute such model a stock car under this definition. The required percentage of output shall in every case be in accordance with the above table and in no event shall it be less than 25 cars.

The use of different bodies—touring car, miniature tonneau, runabout, etc.—upon the same chassis shall not constitute a difference of model under the meaning of this definition, but cars thus equipped must be entered in the respective classes to which the body equipment renders them eligible. Miniature tonneaus, surreys, double or single runabouts shall, for the purposes of these rules, be considered runabouts. Tops, wind shields and extra tires may be removed, whether or not they may be furnished as regular equipment. Otherwise, car must be in construction, material and equipment exactly as offered for sale to the public.

Copies of the official certificate of description, above mentioned, will be furnished by the Contest Board to the promoter of any contest upon receipt of his entry list, and the cars entered must absolutely correspond to the detailed description therein contained; otherwise they shall not be permitted to start in the contest and entry fee paid shall be forfeited to the promoter.

**Stripped Stock Chassis**—"A motor car chassis which, except for the options listed below, can, by adding the necessary parts, be assembled into a complete stock car." (See "Stock Car" definition.)

**Options permitted:** Lighter springs; piston diameters; change of steering post angle; length and angle of change-gear, brake and other control levers; change of driving gear ratio, wheel diameters excepted; length of clutch, brake, accelerator and other pedals; tire and rim equipment; style of dash, seat and body equipment (see rule governing Dash Requirements); form, volume and location of fuel and oil tanks (system employed in either case must remain unchanged); exhaust header and exhaust pipe (except as limited by Rule 69 governing direction of exhaust); use of shock absorbers; winding of springs. Bonnets must be carried throughout a contest, but may be cut away at the side for the passage of exhaust pipes. (See Rule 70 governing loss of bonnet). Bonnet straps must be added. Special wheel fenders or radiator protectors of any design may be used, provided they are securely attached to the car in a manner satisfactory to the referee.

**Note on Lubrication**—Where a reserve oil supply is provided, a pipe connection with a hand-pump may be employed to transfer the lubricant to the standard oil receptacle regularly supplied by the manufacturer with the car, but in no instance will it be

permitted to connect a reserve oil supply directly with the parts to be lubricated unless such connection may be the standard lubrication equipment under the "stock" definition.

**Dash Requirements**—The only alteration permissible in the dash of a stripped stock chassis is that its contour may be made to conform with that of the bonnet; no perforations in the dash will be permitted; standard stock car dash equipment must be carried.

**Additional Parts to Chassis**—Dash, seat, body, tank or other permissible equipment—shall be of substantial and safe construction within the approval of the Technical Committee of the Contest Board.

**Rule 69. Motor Exhaust**—The exhaust must be conducted outside of the bonnet and so directed as not to raise dust.

**Rule 70. Loss of Bonnet**—The bonnet must be carried throughout a contest. If the bonnet becomes detached or lost from a car, the driver shall be required to bring his car to a stop in the shortest possible distance consistent with safety and remain at a standstill until the bonnet has been recovered and replaced.

In a road race he shall not pass the judge's stand until the bonnet has been so recovered and replaced.

In contests on tracks and speedways, a bonnet lost in one lap may be recovered in the next succeeding lap.

**4. Bona Fide Status of Stock Car**—It is the intention of the rules relating to stock cars and stock chassis competitions that such competitions shall be restricted to those cars identical in specification, materials and design with the manufacturer's product which is manufactured in quantity and is offered for sale and sold in a bona fide manner to the public through the regular selling agencies of the manufacturer.

**5. Evasion of Stock Car Definition**—In the event of evasion on the part of entrants of the spirit of the "stock car" or "stock chassis" definition concerning points not definitely stated in these rules, the Contest Board shall have full power to render such decision as it may deem for the welfare of the sport and industry.

**6. Technical Committee**—In any case where it may be necessary to establish the status of any car alleged to be a stock car under the definition contained in these rules, the Technical Committee of the Contest Board shall have the right to visit the factory of the manufacturer of such car, who shall be required to submit to the Committee such evidence as it may require to verify the allegation on which the "stock" status of the car is based.

The Technical Committee shall also have power to take possession of any competing car at the finish of its competition in any contest and make such examination thereof as may be necessary to establish its "stock" status.

## CLASSIFICATIONS.

**Class "A." Price Classification**—The numbering of the Divisions in this class has been reversed, Division 1A being made the lowest priced cars and seven divisions are provided in this class, instead of six as heretofore:

**Class "A"**—Open to any gasoline motor car (other than motor cars with solid tires, wheels 36 inches in diameter and over) which complies with the definition "stock car," this class to be run in the following divisions:

Division 1A.....	\$800 and under
Division 2A.....	801 to \$1,200
Division 3A.....	1,201 to 1,600
Division 4A.....	1,601 to 2,000
Division 5A.....	2,001 to 3,000
Division 6A.....	3,001 to 4,000
Division 7A.....	4,000 and over

Extra or optional equipment, listed in the manufacturer's catalogue as such, used upon a car competing under price classification, must have its list price added to the list price of the car, and this total price shall determine the classification of the car. No extra equipment shall be permitted other than that listed as such in the manufacturer's catalogue.

No car shall compete in any class above that to which its price entitles it.

**Class "B." Piston Displacement and Minimum Weight "Stock" Cars**—The numbering of the divisions in this class has been reversed, Division 1B being made the smallest piston displacement, 160 cubic inches and under, and a sixth division has been added for the larger cars.

It should also be noted that in this piston displacement class it is intended that cars should compete

at their normal minimum chassis weights, the adding or attaching of any dead weight to the car as ballast to enable it to compete in any other division than that to which its normal chassis weights entitles it, being prohibited.

To meet this prohibition against ballast, the minimum chassis weights have been reduced 100 pounds in each of the six divisions.

Class "B"—Open to any chassis of a gasoline car which is in accordance with the definition of a "stock chassis"; to be governed by the following table of piston displacement and minimum chassis weights:

Division.	Piston Displacement in cubic inches.	Minimum Weight in pounds.
1B.....	161 and under	1,100
2B.....	161 to 230	1,400
3B.....	231 to 300	1,700
4B.....	301 to 450	2,000
5B.....	451 to 600	2,300
6B.....	601 to 750	2,500

No car shall compete in any class above that to which its weight entitles it.

No dead weight of any description shall be added to a car or attached thereto in any manner as ballast.

Class "C." Piston Displacement Without Minimum Weight Restrictions or "Stock Car." Qualification—This class has been added to afford an opportunity for competition between motors of approximately equal size, six divisions being provided according to piston displacement but without stock car qualification or minimum weight restrictions.

This class might be considered the experimental or development class.

Class "C"—Open to any gasoline car or chassis made by a factory which has during the twelve months prior to the date of contest, produced at least 50 motor cars (not necessarily of the same model). Eligible for entry under the piston displacement limitations of Class "B," but without minimum weight restrictions.

Division.	Piston Displacement in cubic inches.
1C.....	160 and under
2C.....	161 to 230
3C.....	231 to 300
4C.....	301 to 450
5C.....	451 to 600
6C.....	601 to 750

No car shall compete in any class above that to which its piston displacement entitles it.

The other classes are amended as follows:

Class "D"—Open to any gasoline car which complies with the definition of a "motor car" without restriction as to piston displacement, weight, price or quality produced. There may not be more than two events under Class "D" upon a day's program without special permission of the Contest Board.

Class "E"—Special events other than those above specified held in connection with any motor car meet or contest, and approved by the Contest Board, of which there may not be more than three upon a day's program without special permission of the Contest Board.

Class "F"—Open to gasoline "stock cars" of the high-wheeled, solid tired buggy type, diameter of wheels 36 inches or over. Entries subject to price limitations of Class "A." There may not be more than two events under Class "F" upon a day's program without special permission of the Contest Board.

Class "G"—Open to electric "stock cars" only. Subject to the price limitations of Class "A."

Class "H"—Open to commercial cars, cabs and trucks.—Division limitations to be obtained from the Contest Board.

8. Match Races—Matches may be held as contests of any kind covered by any of these rules and may be run under any of the classes or divisions.

#### GENERAL RULES.

Contest Board National Organization.—First. Provisions have been made for the appointment by the Contest Board of the Referee for every contest, from a selected list of men of undoubted standing, familiarity with and ability to administer the contest rules, located in every locality where contests will be held and known to the promoting clubs and associations in those localities.

Second. To the further end of establishing and maintaining the strict compliance of all entrants with the "stock" car requirements of the rules, a Technical Committee is provided, of which the Associate Member of the A. A. A. Technical Committee in the district where the contest is held, shall be Chairman, together with such other technical members as the promoter may appoint, to technically inspect all cars offered for competition and to prevent the entrance of other than bona fide stock cars.

Third. The third element to complete the organization of the Contest Board is found in the Official Representative of the Board previously provided for, who will be in attendance at every contest to cooperate with the Referee and the Technical Committee in the strict enforcement of all of the Contest Board rules.

Entries.—The promoter is prohibited, under pain of disqualification, from advertising the proposed competition of any entrant in a contest until his entry has been actually made. The promoter is also required to secure a signed entry blank and entry fee from a proposed entrant, in order to bring such entrant within the jurisdiction of the Contest Board's discipline in case of his failure to appear.

Supplementary Regulations.—In order that the

governmental functions and supervision of the Contest Board may extend to every form of contest, a promoter desiring to make regulations for some particular form of contest not included in the published rules of the Contest Board, may do so upon submitting such supplementary regulations to and receiving the approval of the Contest Board.

Certified Trials.—To put the stamp of authenticity upon any special form of road trial or test of an individual motor car or accessory, the maker, owner, agent or dealer may secure from the Contest Board an official sanction for such trial, which will be carried on under the supervision of a representative of the Contest Board under the General Rules and the Special Rules of the Board in such case provided.

Advertising.—To prevent the holding of contests which could not, in any way, redound to the benefit of the sport and industry, the following rule has been adopted:

"Any owner, manufacturer, dealer, agent or driver taking part in or directly connected with any contest otherwise than under these rules, and obtaining extensive advertising therefrom, shall be deemed to be guilty of a breach of these rules."

Records.—To prevent the indiscriminate advertising and improper comparison or performances or alleged records, all claims for records must be made to the Contest Board within ten days of their accomplishment and no record shall be advertised until accepted and allowed by the Contest Board. The Board may reject any claim which in its opinion would not promote the best interests of the sport.

No claim for a record at a distance under one mile and up to five miles will be allowed unless taken with a recording automatic timing device and the actual recorded evidence submitted.

Provision is made for a Register of Records to be kept by the Contest Board.

Racing Drivers' Register.—All racing drivers are required to register with the Contest Board and receive a registration card, such registration expiring on the 31st of December of each year. A detailed record of each driver's participation in contests throughout the year will be kept. Drivers are required to exhibit their registration cards to the Referee on demand at any meeting.

An unregistered driver may not compete in any sanctioned event.

Amateur Definition.—The definition of an amateur is amended by adding an additional restriction so that "no one who is actively engaged in the automobile or accessory industry" may compete as an amateur.

Amateur Drivers' Register.—For the protection of the amateur driver and to afford bona fide amateur competition, an Amateur Drivers' Register has been established, requiring annual registration with the issuance of a registration card by the Contest Board.

An unregistered amateur may not compete in any sanctioned event.

Amateur Entries.—An amateur shall neither enter for nor drive in any contest a car which is the property of any person or corporation actively engaged in the automobile industry.

Powers of Referee.—For the safety of all concerned, the Referee's powers have been broadened as follows:

He shall prohibit any driver or mechanic from entering or continuing in any contest who, in his opinion, is physically unfit.

He shall have the right to stop a race before its scheduled termination if emergency demand such action, and in such a case no award shall be made.

He may order the postponement of an event for any reason which, in his judgment, after consultation with the promoter and representative of the Contest Board, may be valid.

At his request, a driver or mechanic must furnish a physician's certificate as to his physical and optical fitness to enter a race or may be required to submit to a test to determine such fitness.

The following provision has also been added to the duties of the Referee:

"The Referee may disqualify any driver, mechanic, entrant or entrant's representative who shows discourtesy toward any official."

Delivery of Prizes.—In the event of a protest, or an appeal to the Contest Board from the decision of the Referee, no prizes shall be delivered until an official decision is rendered.

Promoter's Liability.—Promoters are required to use every precaution in the proper preparation of the track or course and the proper safeguarding of same during practice or the running of a contest, and shall be held responsible for any accidents resulting from their negligence in these matters.

Unadulterated Fuel Supply.—Stringent regulations are provided for the testing of contestant's gasoline and to insure the use of a standard and unadulterated fuel supply. Disqualification of the owner, entrant, driver and car, or any or all of them, is the penalty for violation.

#### SPECIAL RULES FOR ROAD RACING.

The protection of the public and of the contestants being the paramount consideration in the running of a road race, the following rules have been adopted:

Permits to Use Road.—Before official sanction will be granted for a road race, hill climb or speed trial, or any other competition on the public highway, a promoter shall first obtain the properly authorized permission of any and all local authorities for the use of such highway and shall file the original or a certified copy of such permission with the Contest Board.

Safeguarding Public and Contestants.—A promoter must also furnish evidence satisfactory to the Contest Board that he has taken every possible precaution to safeguard the general public and the contestants, including the proper preparation of the roadway, and especially for the prevention of dust, the policing of the course, closing of highways and erecting of fences where needed, and shall file with the Contest Board the original or a certified copy of and all contracts and agreements made or entered into by him for the accomplishment of such safeguards.

Repairs and Adjustments.—All mechanical repairs and adjustments must be made exclusively by the crew of a car.

Repair Pits and Attendants.—There shall be located at the start and finish line one repair pit for each car started, not less than 15 feet long and 8 feet wide. Each contestant shall be entitled to have three attendants, two of whom shall be permitted to make replacement of gasoline, oil and water and replacement or replenishment of tires, or crank the motor, when contestant's car is at a standstill at its pit, but said attendants shall in no case make any mechanical repairs or adjustments to the car or assist in any manner in such repairs and adjustments.

Spare parts, tools, etc., may be laid on the shelf or ledge in front of the pit, and pit attendants, while in the pit, but not otherwise, may hand same to the driver or mechanic.

A violation of this rule shall disqualify the car.

Fraud.—Any attempt at fraud in the evasion of the definition of "Stock Car" and "Stock Chassis" and status of the car, on the part of an entrant, shall disqualify the car, the driver and the entrant.

In addition to the foregoing, there is provided a complete set of rules for the running of a road race, including weighing in and weighing out requirements; signal code for contestants; International Road Symbols for marking the course; road regulations; special duties of officials, etc.

#### SPECIAL RULES FOR TRACK RACES.

Tracks are divided into three classes, viz:

One-half Mile.

One Mile.

Two Miles or over (specially constructed speedways).

Tracks Must be Licensed.—Tracks will be inspected by a representative of the Contest Board and if arrangement of fences, buildings, ditches, provisions for laying the dust and other safeguards meet the requirements of the Contest Board, they will be licensed, such licenses expiring on December 31st of each year.

Licenses will not be issued to tracks which from the nature of their surfaces or turn, whether on account of dust, roughness, fencing or otherwise, may be considered dangerous.

Track Meeting Limited to Three Days.—No sanction will be granted for a track contest of more than three days' duration.

One-Half Mile Track.—No record will be allowed which is made on a track less than one mile in length.

Driving Reverse Way of Track.—Any contestant who drives the reverse way of a track shall be immediately disqualified, suspended and reported to the Contest Board. The Referee has no alternative in this regard.

#### SPECIAL RULES FOR LONG DISTANCE TRACK RACES AND 24-HOUR TRACK RACES.

Change of Drivers.—No driver shall be permitted to drive or have charge of a car for more than three consecutive hours. After the expiration of such three-hour period he shall not be again permitted to drive until he has taken at least one hour's rest.

No 24-hour race shall be permitted on a one-half mile track.

Repairs and Replacements.—Repairs and replacements are restricted to the part or parts actually damaged. No complete assembled unit, such as rear construction, transmission gear case, motor, clutch, etc., can be totally replaced unless damaged in all of its parts. When one or more parts of an assembled unit are damaged, such damaged parts only may be replaced.

Other rules added are:

Adequate code of signals to contestants.

Restriction of repairs and adjustments to a car on the track to those which can be made by the driver and mechanic and only such as will enable the car to run to the pit or paddock.

In case of total disability on the track, a car may be towed to the pit or paddock by a car approved by the Referee.

Technical inspection during a race of any car which may be considered unsafe.

Stopping and restarting of race not to be announced in advance.

No work to be allowed on a car during any intermission.

#### SPECIAL RULES FOR HILL CLIMB.

Provisions previously cited relative to permits to use the public roads and evidence of safeguarding public and contestants must be complied with before sanction will be issued.

Length and Grade.—The promoter must file with the Contest Board ten days before the running of any hill climbing contest a surveyor's certificate of the length of the hill to be climbed, and a profile showing the greatest percentage of grade at any point and the average grade for the total distance. These figures must also be stated in the entry blank.

**T**HE new Rambler, because of its quiet ease of motion, reserve power, and dignity of comfort, affords to the busy man pleasing relaxation and healthful recreation with family or friends at the end of the day. For satisfactory operation in crowded city traffic, on boulevard, or country road the new Rambler, because of the offset crank-shaft, is capable of three or sixty miles an hour, on high speed, climbing any hill with gratifying ease. The Spare Wheel obviates tire trouble. With straight-line drive, big wheels and tires, and new expanding clutch the new Rambler is superior to all in efficiency and better than any in quality, silence, and comfort.

Rambler automobiles, \$1,800 to \$2,500

**Thomas B. Jeffery & Company**  
Main Office and Factory: Kenosha, Wis.  
Branches: Chicago, Milwaukee, Boston, Cleveland and San Francisco

## THE TRAIL OF THE ZIG-ZAG TIRE CHAIN

### Is Additional Safety Without Extra Expense Worthy of Your Consideration?

Most live dealers handle Zig-Zag Tire Chains. If yours does not, write us.

#### RETAIL PRICE LIST

28x3 .....	\$6.50	30x4 .....	\$8.50	32x3½ .....	\$8.50	34x3½ .....	\$9.50	36x3½ .....	\$10.00
28x3½ .....	6.50	30x4½ .....	8.50	32x4 .....	9.00	34x4 .....	9.75	36x4 .....	10.00
30x3 .....	7.00	31x4 .....	8.75	32x4½ .....	9.00	34x4½ .....	10.00	36x4½ .....	10.50
30x3½ .....	7.00	32x3 .....	8.00	33x4 .....	9.50	34x5 .....	10.50	36x5 .....	11.00

In ordering tire chains for use on Bailey treads or Dunlop 3, 4 and 5 inch tires, or heavy flat tread tires, specify the next size larger than the size of the tire. Example: If you use regular 34x4 plain tires, order 34x4½ for Bailey or Dunlop.

## THE TRAIL OF THE COMMON KIND

## AIR SPRINGS TO EASE ROAD SHOCKS

British Inventor of Pneumatic Suspension  
Discusses Principles—Packing "Mitten"  
Solves One Difficulty.

Considerable attention was attracted to a system of pneumatic suspension which was applied to an automobile exhibited at the Olympic show in London in November last. A system somewhat similar in principle was exhibited at about the same time as worked out for bicycle and motorcycle use. The latter, it appears, also has been applied to automobile service and is now being perfected for that purpose. Its inventor, Archibald Sharp, the well known scientist, has prepared an exhaustive thesis on the subject of pneumatic suspensions in general, which was presented before a recent meeting of the Incorporated Institution of Automobile Engineers. In it not only the theory of automobile suspension is considered in the most general way but the principles of the Sharp system are expounded in such a manner as to emphasize the advantages of its simplicity.

"If a springless vehicle moves over an uneven road," says Mr. Sharp, "the whole of the mass of the vehicle is subjected to a series of irregular accelerations in a vertical direction. The force required to produce the vertical acceleration is proportioned to the mass partaking of the vertical acceleration and to the vertical acceleration at the instant. The object of introducing springs in a road vehicle is to reduce the mass of that proportion of the vehicle which partakes of the vertical acceleration due to the irregularities in the road surface. The pneumatic tire, in running over a small obstacle on an otherwise smooth road, is ideal in this respect, since the mass partaking of the vertical acceleration is merely that of the small portion of the tire in the neighborhood of the obstacle. In a less degree, this applies to the solid rubber tire. But the pneumatic tire is of little value as a spring when the road surface is fairly smooth, but wavy or lumpy.

"Generally speaking, . . . the less the mass of the wheel, axle and parts partaking of the vertical movement of the axle, the more advantageously applied is the springing. This at once suggests the much debated question of live axle versus chain drive; but we engineers learn by everyday experience that in designing such a complex article as a motor car the engineer who places undue importance on any one element is not likely to produce the most desirable result. It is far from my mind to express the opinion that the live axle is inferior to the chain drive, on account of the non-spring-supported mass, well knowing that the springing of the vehicle is only one of the many factors to be considered by the designer."

The vertical acceleration of the unsprung vehicle is a question of pure kinematics, he explains and readily calculable if the precise conditions of vehicle speed and road surface are known. Ordinarily, it is needless to add, they are not known save in a rough and hazy way. Nevertheless, his calculations from assumed data are most instructive.

"Let us assume that a rigid wheel 30

Fig. 1

inches in diameter is running on a level road," he says, "and suddenly encounters an obstacle 1 inch high. Let the speed of the vehicle be  $22\frac{1}{2}$  miles per hour—that

Fig. 2

is, 33 feet per second. . . . As it first touches the obstacle, the point of contact of the wheel with the horizontal surface of the ground is then  $5\frac{1}{2}$  inches, or, say, half a foot, behind the obstacle. The center of the wheel moves forward the distance of half a foot in  $1\text{-}66\text{th}$  part of a second, and in the same time the wheel is lifted vertically 1 inch."

It is assumed that the acceleration is con-

stant during this time, the acceleration can be calculated by means of well known formulas in elementary mechanics, and is worked out by the author at 726 feet per second—that is, 22 times the acceleration due to gravity alone. The force required to produce this acceleration—that is, the additional upward reaction on the wheel, over and above its own dead weight—is 22 times its weight.

"The center of the wheel being vertically over the obstacle," he continues, "it is still moving vertically upwards with a velocity. The average vertical velocity during the upward acceleration is .66 inches per second, and the final velocity at the end of the acceleration—that is, when the center of the wheel is vertically over the obstacle—is twice this amount—that is, 1.32 inches per second. The wheel will continue rising, and it will rise in the air a further distance of 2 feet, and will remain in the air nearly two-thirds of a second before reaching the horizontal road surface.

"If the linear speed of the vehicle be doubled, the vertical acceleration is four times as great; if the linear speed of the vehicle be trebled, giving a race track speed of  $67\frac{1}{2}$  miles per hour, the vertical acceleration is nine times as great—that is, 198 times that due to gravity—while the wheel will remain in the air nearly 2 seconds.

"The possibility of the wheel remaining in the air for even a fraction of a second without driving contact with the road, is of great importance as bearing on the durability of the tires. With the engine running at 1,200 revolutions per minute, if a driving wheel leaves contact with the ground for even a quarter of a second, in this period the engine makes 5 revolutions, and the energy of the explosions is expended in accelerating the driving mechanism, including the driving wheel. Therefore, when the tire reaches the ground its linear speed is faster than that due to the speed of the car, and it scrapes on the ground, wearing the tire, and possibly damaging the road surface.

"In a motor car the road wheel is pressed downwards by the spring, and is not in air so long as in the simple case above discussed. In a car in which the back axle load is 1,200 pounds, and the weight of the back wheels, axle and all masses moving with the axle is, say, 200 pounds, the downward acceleration of the wheel, which begins at the instant the center of the wheel is vertically over the obstacle, is six times that due to gravity—that is, equal to 192 feet per second.

"If the car is traveling at  $22\frac{1}{2}$  miles per hour, and the wheel encounters an obstacle . . . the wheel will remain in the air about  $1\text{-}15\text{th}$  part of a second. If with the same conditions the speed of the car is doubled, the time the wheel hangs in the air is approximately doubled. If the weight of the non-spring-supported mass be smaller relative to the total wheel load, the time the wheel hangs in the air is reduced. . . .

"Fig. 1 is intended to illustrate in purely diagrammatic form the principles involved in the application of an air spring to a road vehicle. The axle of the road wheel W is attached by a rod or the equivalent to a piston P, which is free to move up and down in the cylinder C. The upper end of the cylinder C is in communication with a reservoir fixed to the chassis, into which air can be pumped. The under side of the piston is exposed to atmospheric pressure. The vertical travel of the piston in the cylinder is, of course, limited. If a load be placed on the chassis while the pressure of the air in the reservoir is that of the atmosphere, the chassis is in its lowest position relative to the road surface, the piston presses on the upper end of the cylinder, and the load is transmitted through the solid connections. The vehicle is then practically springless. But if air be pumped into the reservoir until the air pressure on the piston is just equal to the load on the chassis, there will be no pressure between the piston and the top end of the cylinder. On pumping more air into the reservoir the chassis will rise and will be air-supported.

"For example, if the total wheel-load is 1,000 pounds, and the area of the piston 10 square inches, a pressure of 100 pounds per square inch will be required for the air in the reservoir. If this pressure is exceeded the piston will be blown into contact with the lower end of the cylinder, when the pressure in the reservoir is less the piston will be in contact with the top end of the cylinder. With the piston floating about midway in the cylinder, if the road wheel has to mount an obstacle, the piston is forced upwards in the cylinder, the total volume of air under pressure is slightly reduced, and the pressure per square inch is slightly increased. By making the volume of air enclosed in the reservoir large compared with the volume swept through by the piston in rising a given distance, the excess force producing vertical acceleration of the chassis can be reduced to a minimum.

"Thus, if the stroke of the piston in the cylinder be 4 inches, and the air is pumped so that normally the piston is in the middle of its stroke in the cylinder, the road wheel will be able to surmount an obstacle of slightly less than 2 inches in height, or will be able to drop into a hole in the road slightly less than 2 inches in height, without appreciably affecting the supporting force on the chassis.

"In practice I find it best to have the air pressure in the reservoir slightly in excess of that above described, so that normally the piston is pressing slightly against the bottom of the air cylinder. Under these conditions the full stroke of the air spring is available for the road wheel mounting obstacles, and there is no relative movement of piston and cylinder when the road surface is absolutely smooth. But when the road wheel dips into a hollow, the whole vehicle drops, and when the road wheel is rising out of the hollow, the piston rises in

the air cylinder, and the chassis is then gently lifted by the excess air pressure.

"Any combination of a cylinder, piston and piston-rod may be used for an air spring; the ordinary tire pump is a good

Fig. 3

example of such an air spring. But with the usual types of pistons and plungers that are met with in engines and pumps, no matter how perfect the piston-pump or packing

Fig. 4

may be, there is a slight leakage. The obvious solution is to have an air-ump driven by the engine which continually pumps air to replenish that lost by the leakage from the compressed air reservoir. The replenishment may be controlled by a valve

under the control of the driver, or automatically. . . . In the system of air-springs which I have invented, I employ a rolling packing 'mitten' which permits of the piston or plunger being an easy, practical fit in the cylinder, and at the same time provides an absolutely air-tight joint."

The accompanying illustration, Fig. 2, shows the principle as applied in the cycle type of air-spring invented by Mr. Sharp, the construction of which is apparent even without reference to the guide numerals. Its parts are made of stampings from sheet steel. The principal members are upper and lower sections, which are made in two parts, suitably screwed together to form air-tight joints for the attachment of the mitten. The lower part of the air-cylinder 1 is closed at the lower end, while its upper end is provided with a flange for the reception and fastening of the larger end of the mitten. The lower part 5 of the plunger is an easy riding fit in the lower part of the cylinder. The upper part 2A of the plunger is closed at the upper end, which is reduced in diameter to form an external pin to which the saddle pin can be clamped. The smaller end of the mitten is pressed between a conical surface on the upper part of the plunger and a retaining ring 6 when the two parts of the plunger are screwed together. Similarly the larger end of the mitten is pressed between an inside conical surface on the cap 4A and the end of the air cylinder, when the screw ring 3 is turned up tight on the cap. The plunger is guided mechanically by the neck of the cap 4A and by the air cylinder.

When air is forced into the saddle pillar through the cap, and valve 51, in the base—to which an ordinary tire pump may be attached—the plunger is forced upwards until the inturned flange on the lower part 5 comes into contact with the rubber washer 36. The device is assembled in an ordinary bicycle frame by means of the clamps 68 and 66. A device which is applied in the suspension of the front fork is similar in general construction. Regarding the construction of the all essential "mitten," the author continues:

"The rolling packing mitten is built up of two layers of parallel threads arranged close together side by side, the layers crossing each other at a small angle, 10 to 15 degrees, with the axis of the mitten; thus a thread of one layer crosses the threads of the other layer at an angle of 20 to 30 degrees. A layer of india rubber is vulcanized to the fabric in the inside surface of the mitten, and this layer of rubber is relied upon for making the mitten impervious to air. Another layer of rubber is vulcanized on the outside of the mitten with the object of preserving the fabric as it rolls from the plunger to the cylinder, or vice versa."

For experimental purposes four of these devices were employed in the suspension of a light runabout. While their operation is said to have been satisfactory, the result showed that the wear of the mittens was excessive

and that a large and modified construction must be necessary for work of this class. Accordingly the modified design shown in Fig. 3 was adopted. Mr. Sharp explains that it differs from the cycle type of air spring, "in that the central retaining bolt is dispensed with, and the large end of the mitten is held in a tubular holder H, the end of which is adapted to squeeze a rubber ring R against the end of the cylinder, making an air-tight joint therewith, when the screw-cap C is screwed up.

"The end of the mitten holder forms a stop, limiting the outward stroke of the plunger. With this design, upon unscrewing the cap C the plunger, mitten and mitten-holder can be withdrawn from the cylinder and the mitten is then easily accessible. Joint pieces are fastened to the ends of the cylinder and plunger, respectively, to connect the air spring to the chassis, road wheel axle, or axle casing, respectively, the valve being inserted in one of the joint pieces. The diameter of the air cylinder is

3½ inches; the diameter of the plunger, 2½ inches; the stroke, 3 inches; supporting area for calculation, 7 square inches; the volume of air enclosed when the plunger is fully extended is 87 cubic inches; the volume of air displaced by a full stroke of plunger, 21 inches. The parts are 0.5 inches thick, and the air spring can resist a proof test to an air pressure of 500 pounds per square inch.

"The air spring being adapted to resist merely an axial load, when used in a motor car lateral constraint must be provided between the wheel axle of the chassis, in addition to the longitudinal constraint. This involves a redesign of certain parts of the chassis. Fig. 4 shows one suitable sketch design of a live axle. It is to be remembered that air springs cannot resist the torque, so that torque rods are absolutely necessary. The live axle casing, torque rods and the two diagonal rods form a rigid pyramidal structure having its vertex at V. The vertex V is secured to the chassis by

a universal joint. The two side radius rods ensure that the live axle will always remain approximately at right angles to the longitudinal axis of the car. The diagonals in combination with the radius rods ensure that the road wheels cannot move laterally relative to the chassis, while the two road wheels are free to move vertically, either separately or simultaneously, under the control of the air spring. The design of the front axle can be provided with equal facility."

#### Big Mileage for Western Emergency Car.

Fourteen thousand miles in three months or more than 150 miles per day, is the remarkable record claimed for a six-cylinder Franklin in the service of the Union Oil Co. in California. The car is used in the work along the pipe lines between Coalinga and Port Hartford, and is called upon to make many emergency trips at high speed and over rough ground; in some places there is hardly more than a trail to follow.

# PREMIER

In the selection of a motor-car, what counts most with YOU?

Is it Reputation? Is it Appearance? Is it Safety, Dependability? Is it Speed, Power, Efficiency? Is it Past Records?

**If Reputation**—The PREMIER has the reputation of being the car of the motor wise—the choice of the people who can judge what constitutes a good motor car.

**If Appearance**—The PREMIER looks what IT IS—the equal of any motor car made at any price.

**If Speed, Power, Efficiency**—With these qualities in their highest development the PREMIER combines the greatest possible satisfaction of operation.

**If Safety, Dependability**—The PREMIER effective braking surface of 526 square inches, as against 300 or less square inches of cars in general, is typical of the superior safeguards provided THROUGH-OUT the PREMIER.

**If Past Records**—No other car, whatever its class, can show a record career equal to the PREMIER'S in the greatest, severest motor reliability contests ever held.

"When the PREMIER COMPANY took out a license under the Selden Patent, they entered into an arrangement which not only protected the future customers, but everyone who had ever bought a PREMIER, since they paid back royalties covering every PREMIER which had been bought." All Motor-Preference that is founded on fact settles on the Premier. Get the full facts—Inspect the 1910 models. Read "How to Buy a Motor Car." We have secured a number of copies of this, one of which we will send you free for the asking. Write for it.

**PREMIER MOTOR MFG. CO.**  
Indianapolis, Ind.

Licensed under Selden Patent.

#### SIX-SIXTY

Or, do you ignore all the above and trust entirely to your own judgment of machinery and design? Then inspection of the Premier will be just as conclusive of its superior value as any of the other considerations.

TIMES BUILDING. NEW YORK

## RECENT PATENTS.

940,069. Wheel Drive for Automobiles. Thomas G. Rowe, Los Angeles, Cal. Filed Aug. 1, 1907. Serial No. 386,671.

1. The combustion of the two-part, pivotal jointed axle incasing a universal jointed two-part driver having a clutch member to engage a notched boxing surrounding part of said driver, with a spoke-shell surrounding said boxing, means for tightening said shell to cause it to rotate with said driver and boxing, and a dust-cap fitting the end of the spoke shell and clamped thereon by the tightening of the shell.

940,104. Ambulance. John P. L. Wilson, Cleveland, Ohio, assignor to The White Company, Cleveland, Ohio, a Corporation of Ohio. Filed July 29, 1907. Serial No. 386,111.

1. In an ambulance, the combination of a seat hinged to the side thereof, and a toggle whose links are respectively pivoted to the under side of the seat and to the side of the ambulance under said seat, said toggle links being of such length that when the seat is in a horizontal position the toggle link hinged to the side will be stopped by engagement with said side.

940,145. Motor Vehicle. Budd D. Gray, Providence, R. I., assignor to American Locomotive Company, New York, N. Y., a Corporation of New York. Filed May 6, 1907. Serial No. 372,091.

1. In a motor vehicle, the combination of a fixed axle, a steering pin secured there-in adjacent to one of its ends and having journals projecting above and below the axle, a steering knuckle mounted on and vibratable about the steering pin and having a peripheral bearing surface and a central journal, a supporting wheel eccentric to the axle and having a hub inclosing the steering pin and steering knuckle and mounted rotatably on the peripheral bearing surface and central journal of the steering knuckle, a gear journaled in the steering knuckle, a gear fixed to the wheel and engaging the gear of the steering knuckle, means eccentric to the wheel for rotating the gear of the steering knuckle, and means for moving the steering knuckle about the axis of the steering pin.

940,243. Means for Attaching Demountable Rims. Harry H. Ford, Bridgeport, Conn., assignor of one-half to Harry H. De Loss, Bridgeport, Conn. Filed Aug. 17, 1908. Serial No. 448,823.

The combination with a wheel rim and a tire rim of appreciably greater diameter than the wheel rim, of a plurality of bolts lying between said rims, and clamps on said bolts which engage said rims respectively and secure them rigidly, to each other, the clamps having inwardly extending lips engaging under the wheel rim and having portions engaging both inner and outer portions of the tire rim to hold the tire rim spaced from the wheel rim.

940,448. Spark Plug for Internal Combustion Engines. Maurice Eyquem, Paris, France. Filed April 28, 1908. Serial No. 429,616.

1. A spark plug for the ignition of internal combustion engines, comprising a tubular electrode, a cock mounted on the latter and opening to the exterior, a short circuiting rod arranged on the plug of the cock and keyed so as to come in contact with the metal body of the spark plug when the cock is open, substantially as described.

940,528. Tire. William D. Harris, Philadelphia, Pa., assignor to Harris Tire & Rubber Co., Philadelphia, Pa., a Corporation of Maine. Filed Oct. 2, 1907. Serial No. 395,510.

A hollow tire having a rubber body portion provided with an annular recess in its wearing face, a piece of canvas extending longitudinally around the tire in the recess and having its edges turned up along the sides thereof so as to line said recess, with a body of fabric strips set in the recess upon said lining of canvas between said turned up edges, and said strips extending circumferentially of the tire and being arranged to lie in planes substantially perpendicular to the tread surface thereof.

940,543. Spare Tire Case. Joseph J. Murray, Newton, Mass. Filed Feb. 26, 1908. Serial No. 417,813.

1. A device such as described, comprising a cylindrical box, a support for said box fastened to the rear face thereof and to the running board of the vehicle adapted to maintain it in upright position, and means for maintaining a vehicle tire in position concentric to the periphery of said box.

940,602. Vehicle Wheel Rim. Oswald Kirsch, Akron, Ohio. Filed April 5, 1909. Serial No. 487,932.

1. A vehicle wheel having a rim with an inclined outer face provided with a plurality of spaced recesses, a detachable rim provided with a plurality of spaced inwardly projecting pins, arranged when said detachable rim is positioned, to be received in said recesses, said detachable rim arranged to carry an elastic tire, a pair of oppositely-disposed brackets mounted on the side of said wheel, each of said brackets provided with a radially projecting pin, a pair of semi-circular members conforming in contour to said detachable rim the ends of which are mounted on said radially projecting pins, each of said semi-circular members provided with a rotatable nut having a threaded aperture and a plurality of studs having threaded projecting ends carried by said wheel arranged to engage in the threaded openings in said nuts for clamping said semi-circular members against the inwardly projecting pins of said detachable rim for removably locking them in said recesses whereby said detachable rim is temporarily secured in position.

942,290. Fender. Augustus W. Shank,

Detroit, Mich., assignor, by direct and mesne assignments, of one-half to George Rottman, one-eighth to George W. Lynn, and one-eighth to William W. Thackabury, Detroit, Mich. Filed Feb. 3, 1909. Serial No. 477,811.

1. A fender for an automobile comprising in combination with the steering bearing wheels and members of the running gear which swing with the said wheels, supporting brackets secured to said members, and a shield in front of said wheels pivotally supported on the brackets.

942,488. Controller for Electric Automobiles. Henry P. Dodge, Toledo, Ohio. Filed June 5, 1909. Serial No. 500,322.

1. In a device of the described character, a fixed member, a member mounted movably relatively to the fixed member, two parallel series of electrical contacts carried by one of said members, a contact piece carried by the other member, and means for moving said contact piece into alignment with either of said series and into electrical engagement with either of said contacts combined with means for holding said contact piece normally in open circuit position.

942,493. Fluid Cooling Means for Gasoline or Other Engines. Milton A. Fesler, Visalia, Cal. Filed March 23, 1906, Serial No. 307,596. Renewed March 9, 1909. Serial No. 482,402.

1. In combination with an engine of the class in which a fluid is cooled for re-use, a hollow fly wheel driven by the engine, having hollow spokes connected with the rim of the fly wheel said spokes being elongated in cross section and the general direction of said cross section being oblique to the axis of the fly wheel, and means for conducting the fluid to and from said spokes, substantially as described.

942,497. Speedometer. William R. Harris, Irvington-on-the-Hudson, N. Y. Filed July 28, 1908. Serial No. 445,807.

1. The combination with the indicator hand of a speedometer and the scale over which said hand moves, of an adjustable and settable contact member co-operatively associated with the indicator hand and with which the pivotal end of the latter makes continuous contact during a part of its registering movement, a pointer movable with said contact member, and means for adjusting and setting the said contact member and pointer.

# MORGAN & WRIGHT TIRES ARE GOOD TIRES

## BRISCOE HEADS THE UNITED STATES

**Chosen President of the New \$16,000,000 Merger—The Other Officers and Some of the Plans.**

The United States Motor Co., the \$16,000,000 merger which, having already taken in the Maxwell-Briscoe Motor Co. and the Columbia Motor Car Co., is scheduled shortly to absorb a substantial list of makers of tires, bodies, engines, parts and accessories, with perhaps several more car makers for good measure, held a meeting on Tuesday, 1st inst., when permanent organization was effected, with Benjamin Briscoe, the head of the Maxwell-Briscoe company, as president. The other officers chosen include John B. Maxwell, first vice-president; Henry W. Nuckols, vice-president; Carl Tucker, treasurer; J. W. Wellington, assistant treasurer; F. D. Dorman, secretary; W. F. Crosby, assistant secretary. As in the case of President Briscoe, the offices held by Maxwell, Wellington and Dorman in the new organization correspond to those they hold in the Maxwell-Briscoe Motor Co., while Nuckols is vice-president and general manager of the Columbia company.

As yet the board of directors is in something of a fluid state, among those whom report has mentioned in connection with its membership, in addition to Briscoe, Maxwell, Tucker and Crosby, being Kenneth B. Schley, Herbert Lloyd, Richard Irvin, Henry E. Tobey and James C. Brady, the latter a son of Anthony N. Brady, who with Lloyd, president of the Columbia company, is allied with what are known as the Electric Storage Battery interests.

This month the big company becomes the general sales agent for all the lines manufactured by its constituent companies. According to President Briscoe, however, this does not mean that all the lines which eventually will be manufactured by the constituent concerns are to be marketed by the same dealers. It does presage, however,

that not only with the sales be handled, but the purchases of material for all of the constituent concerns will be made by the United States company, which is to be more than a mere stock holding corporation.

Temporary offices in New York City will be taken within the coming week. These will be occupied until summer, by which time the United States Motor Co. will have completed a building of its own.

### Kelly Forming a New Tire Company.

With Charles F. U. Kelly, who for a number of years has been prominent in the tire trade, as the moving spirit, a new tire company is being formed in Toledo, O., to be known as the Kelly-Toledo Tire & Rubber Co., with a capitalization of \$375,000, of which it is planned that \$200,000 be paid in immediately the enterprise is launched. Toledo is looked to as the source for \$100,000 of this latter amount, while Kelly and his associates undertake to supply the other half. The company intends to make rubber tires for pleasure cars, motor trucks, motorcycles and bicycles. Tentative arrangements have been made by which the Willys-Overland automobile plant in Toledo will take a large part of the product.

### Three Added to Licensed List.

Seventy-five makes of automobiles are now numbered in the list of licensees under the Selden patent, three concerns having been added by the Association of Licensed Automobile Manufacturers last week. The trio includes the W. H. McIntyre Co., of Auburn, Ind., making the McIntyre car; the Simplex Motor Car Co., of Mishawaka, Ind., making the Amplex car, formerly known as the American Simplex car; and Flandrau & Co., of New York, importing the Braiser.

### Goodyear Starts Canadian Plant.

Following the lead of several American automobile manufacturing companies, the Goodyear Tire & Rubber Co., of Akron, O., has established a Canadian plant. It is located at Bowmanville, Ont., not far from Toronto.

## TWO WEEKS' SHOW AT CHICAGO, TOO

**N. A. A. M. Finds It Necessary—No Sanctions for More "National" Exhibitions—President Appoints Committees.**

Chicago, like New York, is to have a two weeks show for 1911, and the coming fall will see no repetition of a national show at Atlanta. The hopes of Detroit and Indianapolis for national shows this year, either of an outdoor or indoor character, also seem doomed to disappointment. Such were the results of a meeting of the executive committee of the National Association of Automobile Manufacturers, held yesterday (Wednesday) at the Association's headquarters in New York. The general plans for the conduct of the Chicago show were decided upon, after which resolutions were adopted which will result in the denial of the organization's sanction to any shows during the next twelve months except the two big exhibitions to be held in New York and Chicago, respectively.

An advance has been made in the opening date for the Windy City affair, the first section of which will commence Saturday, January 28, four days after the closing of the Madison Square Garden Show in New York, and will continue until and including Saturday, February 4. The floor will be cleared of cars that night and the buildings will reopen on Monday afternoon, February 6, for the second section of the show, continuing until and including Saturday, February 11.

It has not yet been decided how the exhibits will be divided. It is probable that the space allotted to automobile exhibits during the first week will be given exclusively to members of the National Association of Automobile Manufacturers, Inc., but whether pleasure cars and commercial vehicles will be mixed the second week is a matter for future consideration, and is indicated as being dependent to a considerable extent on the amount of interest taken

in the exhibition by commercial vehicle makers.

The extension of the Chicago show period from one week to thirteen days is made with a view to accommodating more makers of pleasure cars, accessories and motorcycles than heretofore, rather than for fostering a commercial vehicle show, as over 40 makers of automobiles and 200 accessory manufacturers were refused space this year because there was no place to put them, despite the fact that the amount of space at the command of the Chicago show management is greater than that at any other show held in the United States. The makers of commercial vehicles were not even considered at the last show. Not only will there be two installments to the next show, but it is not unlikely that some 30,000 square feet more will be available in the Coliseum by an expanding of the basement so that it will run the entire length of the building. Plans to this end now are under consideration by the Coliseum owners.

In relation to the proposed national shows at Atlanta, Detroit, Indianapolis and elsewhere, the executive committee adopted the following resolutions:

"Resolved, That, in the opinion of this Executive Committee, the interests of automobile manufacturers are well and sufficiently served by the national shows held annually at New York and Chicago, and that an addition to the number of shows would be undesirable;

"Resolved further, That the National Association of Automobile Manufacturers, Inc., will sanction, during the twelve months following the date of this resolution, no shows other than the annual national shows at New York and Chicago."

A report of the late Chicago show was rendered to the committee, disclosing that there had been 1,548 dealers in attendance, and that the total attendance, including the public, dealers, exhibitors and their employes, was between 200,000 and 220,000, or about 20 per cent. greater than last year.

Standing committees for 1910, nominated by the president, were approved by the executive committee, as follows: Membership—S. T. Davis, J. W. Gilson, C. C. Hildebrand. Legislative—W. R. Innis, Benjamin Briscoe, C. G. Stoddard. Good Roads—R. D. Chapin, S. D. Waldon, L. H. Kittredge. Show—W. E. Metzger, A. L. Pope, Thomas Henderson. Contest—H. O. Smith, W. T. White, W. E. Metzger. Auditing—Benjamin Briscoe, S. T. Davis, Charles Clifton. Traffic—A. L. Pope, W. R. Innis, C. C. Hildebrand.

At a meeting held during the Chicago show L. H. Kittredge, of the Peerless Motor Car Co., succeeded S. D. Waldon, of the Packard Motor Car Co., as president. The other officers elected at that time were: William E. Metzger, first vice-president; C. C. Hildebrand, second vice-president; Benjamin Briscoe, third vice-president; H. O. Smith, secretary; William R. Innis, treasurer.

## RUBBER BOOM IS RUNNING RIOT

### Speculative Britons Pour Out Money for Development Schemes—"Synthetic"

#### Rubber in Tires.

Mad as was the public's speculation in rubber tire companies' shares in England not many years back, resulting in many of the lucky investors building up big fortunes from "shoestring" beginnings, an even greater wave of speculation appears now to be sweeping over. Great Britain in relation to the shares of companies either supplying or professing their intention to supply crude rubber, and extending to concerns with schemes for chemically producing "synthetic" or artificial rubber. The great demand for rubber which has been created by the requirements of the motor car is in no small degree responsible for the conditions which have set the British investors crazy on the rubber question, and the ready outpouring of English money which is taking place in the financing of rubber development enterprises promises a measure of benefit to the automobile industry in more quickly increasing future rubber production to a point where it will be commensurate with the demand.

In addition to enormous expansion of capitalization for many older and established companies, over fifty new companies have been floated within a short time, representing more than \$35,000,000 in subscriptions. The new companies are capitalized at from \$50,000 to \$2,500,000, with shares ranging from two shillings, or about 50 cents, to £1, or \$5, par, payable in installments as low as 12 cents each on allotment and 25 cents a month afterward, to meet the appetite of small investors of the sort who are inundating the brokers with such orders as to "buy five rubber shares," without even naming a company preference.

The high prices of crude rubber and the representation that the motor car and electrical industries are making heavier demands for rubber all the time are used as arguments, though the investors in the majority of cases give evidence of being actuated by purely speculative hopes of jumps in the prices of the shares rather than by careful consideration of the legitimate business future of the enterprises.

"Synthetic" rubber or rubber substitutes likewise have been given great impetus by the high price of the genuine article, and one or two of the British tire manufacturing concerns are represented as building experimental tires of materials of this kind. The Dunlop company, it is stated, has adopted a new elastic material invented by a German engineer, Herr Pfeumer, of Salzburg, and has arranged to make Pfeumatic tires under royalties, while Harland & Wolff, the famous shipbuilding firm, also are using the material in the manufacture of

motor car tires. Scores of inventors are at work on compounds in which it is attempted to reproduce the chemical and organic conditions found in the natural rubber.

#### Seven Tradesmen in New Places.

W. C. Long, formerly with the National Acme Mfg. Co., has become identified with the Centaur Motor Co., of Detroit. He will cover territory in its interests.

G. W. Stephens, former advertising manager of the G & J Tire Co., is making ready to set up in the tire and accessory business on his own account. He will locate in Chicago.

W. W. Burke, who last week resigned as manager of the New York branch of the Mora company, has gone with the Carl H. Page Co. The latter is the New York representative of the Chalmers.

William Seward, Jr., has left the Michelin Tire Co., of Milltown, N. J., to join the forces of the Federal Rubber Co., of Milwaukee, Wis. He will represent the company on the road, having a territory embracing four states.

W. I. Fickling has become assistant sales manager of the Rainier Motor Truck Co., at Broadway and Sixty-fourth street, New York City. He formerly was president of Fickling & Co., of New York, making tops and bodies, which recently was petitioned into bankruptcy.

E. L. Wratten, formerly traffic manager of the J. I. Case Threshing Machine Co., of Racine, Wis., has resigned to accept a similar position with the Mitchell-Lewis Motor Co. in the same city. He will have entire charge of the routing of the company's incoming and outgoing shipments.

L. M. Bradley, who for the past three years has been advertising manager of the American Motor Car Manufacturers' Association and assistant to former General Manager Alfred Reeves until the latter accepted the general management of the Association of Licensed Automobile Manufacturers, has been appointed director of advertising and publicity of the United States Motor Co., the \$16,000,000 Maxwell-Briscoe merger corporation. He commences his new duties at once.

#### Will Make the Koeb-Thompson.

Having developed a rather unusual model, with "lever suspension," steering gear on the front axle and other radical features, as recently described in the Motor World, a company has been organized in Leipsic, O., to manufacture the Koeb-Thompson car, invented by Emil Koeb and Ralph P. Thompson, of Springfield, O. The concern will be known as the Koeb-Thompson Motor Co., and it has been incorporated under Ohio laws with \$300,000 capital. The officers are Ralph P. Thompson, president; O. P. Edwards, vice-president; W. E. Edwards, secretary and treasurer; Emil Koeb, general manager. The building formerly occupied by the American Foundry Co. will be used.

## LICENSED DEALERS ELECT OFFICERS

**Make Budlong President and Remove a Bone of Contention—Other Local Body Declines to Die.**

After much pulling back in the traces on the part of some of the Metropolitan dealers, the organization of the Licensed Automobile Dealers Association of the City of New York has been completed; but with the old New York Automobile Trade Association still surviving and with an abandonment of any direct attempt by the Licensed dealers as an organization, to control racing or other contests.

No small part of the difficulties which were cast in the path of the new association arose from the fact that a number of members of the New York retail trade feared that it might encroach on or interfere with their racing projects of one kind and another, including the little melon vine which has its roots in 24 hours racing at Brighton Beach. So strenuous were their protests and objections against any interference in racing matters by the Licensed organization that the latter finally yielded and practically agreed to keep its official finger out of the pie.

At a meeting held at the Automobile Club of America on Saturday, 26th ult., the board of directors, recently chosen, unanimously elected M. J. Budlong, head of the Packard branch in New York, as president, with George W. Bennett, of the White Co., as vice-president, and C. P. Skinner, representing the Mitchell, as secretary. Earlier in the week the directors had received the association's charter from Albany, where it had been approved by the state authorities.

"At the meeting," according to the secretary's report of Saturday's proceedings, "it was brought out that part of Section 4 of the by-laws, wherein the Association apparently was attempting to control contests, was foreign to the original intent of the Association, which was formed purely for business purposes. The matter was thoroughly discussed, the result being that the secretary was instructed to call a special meeting of the members of the Association, to be held at the Automobile Club of America, on Thursday, March 3, when the advisability of eliminating that clause in the by-laws will be discussed by the members as a whole."

Continuing, the secretary has somewhat to say concerning the New York Automobile Trade Association, from which the old officers resigned their positions to join the Licensed movement, but which since has been seized upon for a vigorous rejuvenation as an organization which is to rival the Licensed association in importance. The alleged refusal of M. J. Budlong early last week to become the president of the Licensed organization also is dealt with.

"Mr. Budlong deprecated the many reports (practically all of them erroneous), that had been made relative to his not accepting the presidency," it is declared, "and as to the relations of the Licensed Dealers Association and the New York Automobile Trade Association. It has always been realized that there is room in the city for both associations, and it is openly stated by members of the younger association that the older will have their support."

According to announcements made by the New York Automobile Trade Association that organization is planning a material expansion in membership and scope. At a meeting of the board of directors held last week eight new members were elected and a vigorous membership campaign has been started with the 200 or more concerns in New York handling automobiles and supplies or operating garages, who are not affiliated with the organization. The credit department is to be enlarged and steps are being taken to make an effective standardization of garage charges, not only as to the storing of cars, but also as to the regulation of prices on gasoline, oil and other supplies; the promotion of "rightly conducted touring contests," also will be made a part of the association's future work.

### Fever Checks Seiberling's Brazilian Trip.

F. A. Seiberling, president of the Goodyear Tire & Rubber Co., of Akron, O., who with Mrs. Seiberling has been making an extensive trip in the Amazon rubber district of Brazil, has been called back from the upriver Amazon to Para, where Mrs. Seiberling, who was awaiting him there, was stricken with yellow fever. A late dispatch indicates that she is recovering as rapidly as can be expected.

### Kaufman Heads the Credit Association.

The Automobile Trade Credit Association, with headquarters in New York City, through its board of directors, elected new officers for the coming year, at a meeting held on the 24th inst. Carl Kaufman, general manager of the Motor Car Equipment Co., of New York, was made president, with Michael J. Martin, of the George A. Haws company, as treasurer.

### Atwood-Castle to be Reorganized.

The Atwood-Castle Co., of Amesbury, Mass., making automobile lamps, is to be reorganized as the Castle Lamp Co., and will move to Toledo, O., as soon as a site can be found and factory buildings erected. The capital of the concern will be increased to \$300,000 and F. E. Castle is to be president and general manager.

### Miles Sails to Europe Saturday.

Samuel A. Miles, general manager of the National Association of Automobile Manufacturers, sails for England on Saturday of this week. He will return about the first of April. His trip is made necessary by the recent death of his mother.

## RAILROADS MAKE A CONCESSION

**It has to do with Size of Freight Cars—Shortage Relieved and Thousands of New Cars in Sight.**

According to J. S. Marvin, general traffic manager of the National Association of Automobile Manufacturers, on April 1st next there will become effective a change in the rules of railroads which will simplify matters considerably in securing cars at the factories for automobile shipments. Many factories require freight cars no longer than 36 feet for their shipments, but the railroads frequently supply 40-foot cars, the charge for which is considerably more than for 36-foot cars. Rather than wait indefinitely for 36-foot cars, the factories, to effect prompt deliveries, have used 40-foot cars in such cases.

The new ruling provides that when the factories order 36-foot cars and the railroad is unable to furnish cars of that length, but furnishes instead 40-foot cars, the freight charges shall be computed on the 36-foot car basis. Naturally this will only apply when the machines loaded into the 40-foot cars are of such length that they could actually have gone into a 36-foot car, and this is a point that the railroads will watch very closely; any abuse of the new rule through misrepresentation will result in its withdrawal.

Mr. Marvin has just returned from a trip which covered traffic meetings and conferences at Detroit, Chicago, and New Orleans, in relation to the transportation and rating of automobiles. He reports the freight car situation in Michigan, Ohio and Indiana, where there has been a serious shortage, as much improved by the appearance from car shops of hundreds of new cars ordered some time ago by the New York Central Lines, Pennsylvania system, Wabash, C. & N-W., C. M. & St. P., Santa Fe, Union Pacific, and other railroads. These cars are the railroads' standard box cars, except that they have the double doors recommended by the traffic department, making them available for automobile shipments. In one lot alone there are 5,000 such cars coming through the shops for the N. Y. C. Lines.

Much of the difficulty experienced by factories in getting freight cars for their shipments is due to the slow return of these cars when loaded to distant points. When made empty they should be loaded back to the roads owning them, but instead of doing this the freight agents frequently put them into local service. Mr. Marvin urges that dealers in the West and South interest themselves in this and agitate it with the local freight agents of railroads handling their shipments, as it would help the situation and do much towards effecting prompt deliveries of automobiles from the eastern factories.

**The Week's Incorporations.**

Chicago, Ill.—Hart Motor Car Co., changes name to Interstate Motor Car Co.

Providence, R. I.—Providence Auto Garage Co., changes name to Loring Mfg. Co.

Cleveland, O.—Cleveland Automobile Club, an Ohio corporation, with \$10,000 capital.

Cleveland, O.—Cleveland Automobile Co., under Ohio laws, with \$10,000 capital. Corporators—H. L. Vail and others.

Port Huron, Mich.—Lauth Auto & Engine Co., under Michigan laws, with \$40,000 capital; to manufacture automobile engines, etc.

San Antonio, Tex.—San Antonio Automobile Club, a Texas corporation, no capital. Corporators—R. W. Carr, A. W. Hartman and George M. Fairfield.

Los Angeles, Cal.—National Chauffeurs Association, a California corporation; no capital. Corporators—Henry H. Fouch, O. W. Bradford and B. C. Hurlburt.

Chicago, Ill.—Matador Tire & Vulcanizing Co., under Illinois laws, with \$60,000 capital; automobile and garage business. Corporators—L. G. Smith and others.

St. Louis, Mo.—Haynes Automobile Co., of St. Louis, a Missouri corporation, with \$5,000 capital. Corporators—W. H. Kline, F. W. Niedermeyer and R. P. McBane.

New York, N. Y.—Vinot Automobile Co., under New York laws, with \$37,500 capital; to manufacture automobiles, engines, etc. Corporators—H. S. Lake, A. H. Peyser and S. Kjeldsen.

St. Louis, Mo.—R. H. Combs Motor Equipment Co., under Missouri laws, with \$5,000 capital; to deal in automobiles, etc. Corporators—P. H. and R. H. Combs, and W. S. Ferguson.

Detroit, Mich.—T. H. T. Motor Car Co., under Michigan laws, with \$100,000 capital; to manufacture automobiles and accessories. Corporators—J. H. Taylor, C. Taylor and W. P. Barker.

Chicago, Ill.—M. & G. Mfg. Co., under Illinois laws, with \$2,500 capital; to manufacture and deal in automobile sundries. Corporators—A. J. Musselman, D. W. Gould and C. H. Wells.

Indianapolis, Ind.—Commercial Car Co., under Indiana laws with \$100,000 capital; to manufacture automobiles and act as sales agents. Corporators—Iva V. Buckley, H. T. Huff and E. B. Walker.

New York, N. Y.—Atlas Chain Co., under New York laws, with \$350,000 capital; to manufacture anti-skid chains and automobile appliances. Corporators—G. E. Holmes, D. Milliken, K. K. McLaren.

Chicago, Ill.—National Automobile Co., under Illinois laws, with \$5,000 capital; to deal in motor cars and accessories. Corporators—F. A. Hart, A. E. Aldinger, I. M. Pearson, Colson and Johnson.

Chicago, Ill.—Barry-Ivor-Turner Mfg. Co.,

under Illinois laws, with \$15,000 capital; to manufacture automobile supplies. Corporators—Fred Freer, John D. Gazzalo, John McPherson and Charles A. Burler.

Kalamazoo, Mich.—Kalamazoo Motor Car Co., under Michigan laws, with \$15,000 capital; general automobile business. Corporators—A. E. Rose, Frederick Riley, George V. Weimer and W. B. Orrell.

Spokane, Wash.—Patent Holdings & Mfg. Co., a Washington corporation, with \$3,000,000 capital, to take over the Diamond Carriage Co.; to manufacture roller bearings. Corporators—C. O. Bassett, J. C. Mountain and S. S. Bassett.

Leipsic, O.—Koebe-Thompson Motor Co., under Ohio laws, with \$300,000 capital; to manufacture pleasure cars and commercial trucks. Corporators—O. P., H. E. and W. E. Edwards, Leipsic; Emil Koebe and Ralph P. Thompson, Columbus.

New York, N. Y.—H. & H. Motor Car Co., under New York laws, with \$12,000 capital; to manufacture and deal in gasoline and electric automobiles and engines. Corporators—Charles L. Holden, John H. Hershfield and Solomon Wall.

**Burning Grease Causes Disastrous Fire.**

Fire and explosions of gasoline almost completely destroyed the five-story building, at 244-246 West Sixty-fifth street, New York City, on Tuesday last, 1st inst., occupied by the West End Motor Cab Co., the Sterling Mfg. Co., the McWilliams Machinery Co., and the automobile repair shop of R. B. Laffay. Damage to the amount of \$40,000 resulted, the greatest individual loser being the West End Motor Cab Co. with \$25,000. Eight automobiles were destroyed and nine persons dangerously injured while trying to jump from the burning building.

According to Dan O'Hare, manager of the cab company, the fire was caused by ignition of a pot of grease on the third floor. An employe was cleaning axles from old grease when in some way the latter took fire; the workman grabbed the burning pot and started downstairs, but the flames scorched his face and hands so that he was compelled to drop his burden on the stairs leading to the ground floor. A minute later the whole building was in flames, and a number of violent explosions of gasoline in tanks and cars took place.

**Metzger Increases to a Million.**

The Metzger Motor Car Co., of Detroit, Mich., making the Everitt car and which was organized last September with \$500,000, has been re-incorporated under Michigan laws with \$1,000,000 capital. The re-incorporation is for the purpose of absorbing the Hewitt Motor Co., of New York, which the Metzger company not long ago acquired and which brought with it a Selden patent license. The officers, under the reincorporation, are Byron F. Everitt, president; William Kelly, vice-president, and William E. Metzger, secretary.

**To Build a "Row" in Indianapolis.**

Indianapolis, Ind., is to have a real, full-fledged automobile row, according to the plans of the Fisher Automobile Co., and Carl G. Fisher, president of the Indianapolis Motor Speedway. A real estate deal involving two blocks of residence property on Capitol avenue has just been concluded, and plans for the new buildings have been completed, and are now ready for the contractors. The first step in the establishment of the "row" will be the enlargement of the present Fisher building. This building, which has a frontage on Capitol avenue of 82 feet and a depth of 120 feet, will be enlarged until it will have a Capitol avenue frontage of 202 feet and a depth of 135 feet. The new building will be three stories high, similar in construction and design to the present Fisher building, and will occupy all the space between the present building and Vermont street on the south. Across the alley to the north the plans call for two new three-story buildings, each with a Capitol avenue frontage of 68 feet and a depth of 203 feet. They will be equipped with elevators and occupied by two modern garages and salesrooms. Adjoining the Fisher building on the north three modern two-story automobile buildings will be erected, 44x195, 132x145 and 44x195 feet, respectively. When work is commenced on the new structure it will be pushed forward with all possible despatch.

**Geyler Heads Windy City Dealers.**

The Chicago Automobile Trade Association, of Chicago, Ill., held its annual election on Monday, 28th ult., choosing Louis Geyler, agent for the Stevens-Duryea, as president, to succeed Thomas J. Hay. John H. Kelly, of the Republic Tire Co., was made vice-president, while Henry Paulman, of the Pierce-Arrow, was held over as treasurer. Frank Sparks, of the United Manufacturers, is continued as secretary, but as he has asked to be relieved of the secretarial duties as soon as convenient, a successor will be chosen for him at a later date. Thomas J. Hay, James E. Plew and George H. Bird were elected directors.

**Miller Opens New Orleans Branch.**

Charles E. Miller, the New York jobber, importer and accessory manufacturer, has opened a branch in New Orleans, La., at 601-603 Baronne street, corner of Lafayette. The establishment makes Miller's tenth branch house in addition to the home offices, which are located at 97-101 Reade street, New York.

**Receiver for Chicago Taxicab.**

A receiver for the Chicago Taxicab Co., of Chicago, Ill., was appointed on Monday, 28th ult., following internal financial difficulties. The corporation is capitalized at \$500,000 and operates about 100 cabs. It is announced that the company will continue business and that all obligations will be paid.

## IN THE RETAIL WORLD.

The Magnolia Garage, 170 Congress avenue, has been opened in Houston, Tex.

J. G. Schotthoefer is about to engage in the automobile business in New Rockford, N. D.

W. E. Foster, Hindsboro, Ill., has "hung out his shingle" in that place as the White agent.

P. K. Peterson has embarked in the business at Bisbee, N. D. He has the Mitchell agency.

Savage & Son are building a new garage on South Main street, Rockford, Ill.; it will be ready by April 1st.

Glen Edwards has established himself at 1215 South Flower street in Los Angeles. He is selling the Kline kar.

S. L. Rochette, and Joseph Marin have established a garage at the corner of Moody and Pawtucket streets, Lowell, Mass.

L. A. Donaldson has leased show rooms at 521 Broadway, Logansport, Ind., and will handle the Overland cars exclusively.

W. A. Hausmann has opened a garage and repair shop in Church's Ferry, N. D. C. E. Ryall has done likewise in Michigan, N. D.

At Union avenue, near 166th street, New York City, Abram N. Herbst is erecting a new brick garage 25x150 feet; it will cost \$5,000.

Frank Van Syckle, Perth Amboy, N. J., will open a garage on High street, near Fayette street, about March 1. Repair work will be featured.

A. C. Banker, formerly of New York City, has established himself at 118 North Emporia street, Wichita, Kan. He is handling the Regal car.

Newton R. Goltra, Coscob, Conn., is the proprietor of the Hub Garage, which just has been opened for business. He has had several years' experience.

W. H. Allen, northwestern representative for the Mason car, has established headquarters and salesrooms with the Frank Lynch Co., in Fargo, N. D.

Ole Hansen, of Gwinner, and W. C. Olson, of Hoople, are recent additions to the North Dakota trade. The former is handling Ramblers, the latter Fords.

Monnich & Monnich, Fremont, Neb., have purchased property east of the Cahoon building, on which they will erect a garage. They have the Ford agency.

J. L. Barley, of Marion, Ind., has bought the Marion Automobile and Supply Co., and will continue the business at the old location, corner Adams and First streets.

A new three-story garage is to be erected on a plot 45x119 feet on 181st street, near Audubon avenue, New York City. William A. Darling and Max Marx are the lessees.

Frank A. Walz, an implement dealer in Moorehead, Minn., who recently "took on" automobiles, has converted one of his im-

plement warehouses into a garage and salesroom.

The Commercial Automobile Co. is the style of a new St. Louis concern, which has been formed to handle the Frayer-Miller trucks. Its quarters are at 103 N. Twelfth street.

The Detroit Electric Co. has opened a new garage on Michigan avenue, near Twenty-second street; the workshop is to remain open 24 hours every day, Sunday included.

C. E. Runyon's new three-story concrete garage at the corner of Madison and Sixth streets, Portland, Ore., is nearing completion; it will be ready for occupancy next month.

The Co-Auto Motor Co., Indianapolis, Ind., has opened a salesroom and garage at 23-25 Kentucky avenue. It will handle the Stearns, Fuller, Westcott and Jackson.

Charles Lehn, Easton, Pa., a well known machinist of that town, has opened a garage on the Bethlehem road, on the outskirts of the city. The establishment includes a repair shop.

Concrete and brick will be the materials employed in a new garage just started in Penacook, N. H., which is to be 50x80 feet and cost \$2,000; Doctor Hoyt is the owner of the business.

The Owl Auto Livery Co., Kansas City, Mo., of which C. F. Dinklage is manager, has taken new quarters. It now operates from the Hollister Automobile Co. garage, 1708 Grand avenue.

A combined automobile garage and gas engine works has been established in the McKinnon building on Second and Front streets, Orange, Texas, by A. L. Mitchell and C. W. McFarlane.

J. F. Twentyman and C. De Remer have gone into the automobile repair business at 11 Orchard street, Omaha, Neb. Besides general repairing the firm intends to do all classes of electrical work.

The Palace Auto Station, Worcester, Mass., is having plans drawn for a new garage to be erected at 735 Main street. The building will be of brick construction, 147x71, one story and basement.

A. J. Scott, Rugby, N. D., who handles Maxwells and Hupmobiles, has let contracts for the construction of a concrete garage, 30x140 feet. Work will commence as soon as frost leaves the ground.

The Empire Tire Co. has established a new branch at 1516 Grand avenue, Kansas City, Mo., which will be ready for business on March 15. Its temporary quarters are located at 308 East Fifteenth street.

J. E. Garland, of Tarrytown, N. Y., is planning to erect a garage on the Cypher property on South Highland avenue in Ossining. The structure will be 40x50 feet, and will be built of concrete blocks.

The Wheelock Automobile Co., Fargo, N.

D., are building a brick and concrete garage, three stories high, 75x143 feet, which is expected to be completed by May 1st. The concern represents the Knox, Overland and Hupmobile.

The Walden W. Shaw Auto Livery Co., Kansas City, Mo., which has been incorporated under the laws of that State, with \$100,000 capital, will operate a taxicab service. It has placed its order for Croxton-Keeton cabs.

J. O. Cummins, Roswell, N. M., has let the contract for the erection of a garage on the east side of Richardson avenue, between Second and Third streets. The structure will be 50x200, of brick, steel and cement construction, and will cost about \$10,000.

Fire destroyed the garage of Tinan & Reynolds, at 175 Washington street, Paterson, N. J., on February 24th, causing a loss of \$75,000. Ten private cars were completely destroyed. An explosion of gasoline in the tank of one of the cars is given as the cause of the fire.

Plans for a two-story brick garage, 50x200 feet, to cost \$23,000, have been drawn for T. S. and O. W. West, of Portland, Ore. Its location, Holladay avenue, between Union avenue and East Third street, is somewhat of an experiment, as it is the first garage to be built on Portland's East Side.

Work has commenced on a \$10,000 two-story steel construction garage, 55x170 feet, on Alabama street, between Fifteenth and Sixteenth streets, Indianapolis, Ind., which will be occupied by O. G. Thomas. The building will contain several private rooms, a ladies' room, chauffeurs' room, offices, repair shop, etc.

The Collingwood Automobile Co., Toledo, O., is a new firm which has absorbed the Collingwood garage and the Olds-Oakland company. Sales rooms will be established at Jefferson and Tenth streets, and a garage and repair department will be maintained at Collingwood and Delaware avenues. The line will consist of the Oldsmobile, Oakland and Detroit electric.

Max Moehrle, a manufacturer of carriages and wagons for more than 28 years, has finally decided that there is a bigger future in the automobile field, at least in Philadelphia, and changed his factory on Huntingdon street, into an up-to-the-minute garage. In addition to all kinds of repair work, Moehrle and his partner, John A. Clymer, will undertake to sell the Imperial cars.

The Freeland Brothers-Ashley Co. are building a four-story, full basement, 44x132 feet garage and sales room at the corner of Farnam and Twelfth streets, Omaha, Neb., to cost \$100,000. The building, which is to be ready for occupancy by July 1st, is constructed of pressed brick. The first floor will be given to garage purposes. The second floor is to be occupied by the Apperson sales agency; the third by the Omaha Aeroplane agency.

## The Satisfaction of being "Up-to-Date"

A Little Talk on owning a

# White Gasoline Car

**T**HERE is a certain real satisfaction which comes through the possession of any article which is, in every respect, thoroughly up-to-date. In fact, almost all "shopping" consists of a search for the goods of latest pattern and embodying the latest ideas. In purchasing a motor car, it is particularly important to secure the latest design because the art has been advancing so rapidly that those cars, the design of which dates back two or three years, do not possess many of the desirable features which the present state of the art makes possible.

The owner of a White gasoline car has the satisfaction of knowing that the design of his car is at least one year in advance of any other American machine and that he will see the features which he **NOW** has in his car adopted by other makers next year and the year after. Among these up-to-date features are the "long-stroke" engine, the casting of the four cylinders en bloc with only about one-fourth of the usual amount of piping, the four-speed transmission, etc.

The owner of a White gasoline car can be even more proud of its **QUALITY** than of its up-to-date design. There is no part of the car which could be made of any better material or could be constructed with more care, even if the selling price of the car were one thousand dollars greater.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, MARCH 3, 1910.

"Thank you for reminding me that my subscription to the Motor World was about expired. As I do not wish to expire myself for lack of motor car news of the newsiest kind, I hasten to renew my subscription. I cannot see how anybody considering himself, or herself, to be part of the "motor world" can afford to be without its brilliant namesake. There may be such, but, personally I do not care to miss an issue of your interesting publication.—  
L. H. Perlman, New York."

### The Proof of the Stock Car.

While the definition of a stock car, i. e., one that strictly follows catalogue specifications, is obvious, that is not good enough for racing or other competitive purposes, as is made evident by the repeated efforts to evolve a different and less elastic definition. The new A. A. A. rule, which, as the Motor World last week pointed out, permits practically everything save valves, frames and

wheels to be altered, is a splendid illustration of the squirming and straining that results whenever an attempt is made to avoid the obvious definition.

It therefore easily is possible to picture the cold reception that awaits Mr. Windsor T. White's suggestion that any car shall be subject to immediate purchase. Despite the fact, the idea is a happy one and deserves adoption. It does not assist the attempt to evolve a satisfactory definition, but it does come pretty close to supplying the most satisfying proof, which is, perhaps, even more important than a wordful definition.

That most of the automobilists who read or hear of a stock car contest believe that the cars engaged are exact reproductions of the ones that are offered to them for purchase is undoubted, and "selling races" or anything else that will assist in justifying this natural and proper belief should be encouraged.

### The Matter of Wind Shield Widths.

Up to the present time but little attention has been paid to the question of wind shield widths. But it is not unlikely that before long the subject will require definite settlement. For in addition to the need of as great a measure of standardization as is possible of accomplishment, from the standpoint of economy in production and satisfaction in use, it is a fact as yet little commented upon, that the width of the shield in great measure governs its protective power.

In general it is customary to regulate the width of the wind shield by the width of the dash. Only in comparatively rare cases is the plan adopted of making the screen wider than the dash, although in many respects this would result in increased efficiency, practically speaking. The importance of contriving the device in such a way that its height, and frequently the inclination of the upper section as well, may be regulated to suit the momentary inclination of the operator, is generally recognized. It is a fact not so generally appreciated, however, that the actual protection of the occupants of the front seat is governed to a considerable extent by the relative position of the outer edges with regard to the seat positions.

Generally speaking, the wider the screen, the greater its efficacy in fending off the direct air pressure due to the motion of the car, as well as in deflecting breezes which

strike upon it from a forward angle. Therefore, although a widely projecting shield would be distinctly ungainly, it is evident that its effectiveness would be sufficiently improved to warrant its use, even though it be carried to extraordinary limits and reach clear out to the full width of the mud guards. As it has been found in the case of the requirements for height, inclination and distance from the face of the operator, that it is extremely difficult to fix upon set dimensions applicable with equal impartiality to all sorts of conditions, even upon the same car, it might be that the question of width would be solved to best advantage by providing lateral adjustment in some instances. Certainly it would seem advantageous to provide greater widths than at present are employed on many cars.

### The Value of Improvements.

Rather a delicate and somewhat ethical question is that of the relative value to the manufacturer of improvements in the design of his product. Be it components, complete vehicles or accessories, the producer constantly is vexed with doubts as to whether it would be wiser to continue along the beaten track and hold as closely as possible to present structural standards, or whether it would be more profitable to advance along radical lines. Theoretically, of course, it is incumbent upon him to follow to the best advantage the knowledge which the engineering and scientific skill at his command enables him to master. Actually it is far more expedient in many cases to ignore the possibilities of advanced practice to pursue the advantages of present standing and, like the gentle tentmaker of far-away Persia, to:

"Take the cash and let the credit go.

Nor heed the rumble of a distant drum."

The point is that, while in very many cases better results might be obtained by building a motor with rotary valves, or a car with the motor located in the back of the tonneau, or a searchlight with adjustable focus to be regulated automatically by the speed of the vehicle; two very practical commercial considerations interfere with the carrying out of such undertakings, however well grounded they may be in a scientific way. One of them is that it is expensive business creating and adapting new structural standards, even after the burden of development has been shouldered. The other is that it is expensive business

"bucking the market" with new ideas, and teaching the trembling public to have proper confidence in something which is unfamiliar.

So the ambitious and conscientious manufacturer is buffeted about between his desire for the commercial success which results from giving the buyer just what the buyer thinks he wants, and his desire to give the buyer what he knows the buyer really needs. Probably as many misguided producers have starved by the wayside as a result of lagging along the beaten track as have got lost in the brambles trying to beat out a new way for themselves. The wise business man constantly is making little excursions into the thicket and promptly returning at the first prick of a thorn. But all the while he deeply regrets the immutable law of trade which teaches that in order to succeed a little better than his rival he must do his work a little better than the other, keep his vision a little broader than he and generally stay just enough ahead of him to be counted a leader, yet not far enough to get lost.

It is pertinent, just now, that the automobile industry is settling back into the course which is known as standardization, to suggest that in time that track may be worn into a deep and delusive rut. The older and wiser heads have foreseen such a possibility and are keenly alive to their opportunities. Which means that when they can lay hold of a new mechanism or a new process, however radical it may be, which promises enough advantage to defray the costs of construction and introduction, they will not hesitate to make use of it. In this period of tumultuous production it is difficult to realize that engineering departments are busy with problems of which the public is yet to hear, that improvements, great or small, will continue to be made from year to year, and that invariably someone must lead and others follow in introducing those changes. Yet this is the case, and the administrative problems attending such leadership, the gambling chances which must be taken, even the close study of the psychology of the market, are elements in the day's work which are very vital to its accomplishment.

#### **The Effect of "Influence."**

According to published announcements, the District Attorney of New York no longer will permit offenders against the speed law who are guilty of a second infraction, to plead guilty as first offenders and thereby

escape with the minimum fine. The practice had attained considerable proportions and was one of the many ways in which those who commanded influence brought it to bear. Whether the District Attorney's determination will have any effect in reducing the number of suspended sentences, which is the recourse of offenders with the more powerful influence, is exceedingly doubtful, and while this influence remains potent all the laws which may be passed by an industrious legislature will prove of small effect.

Only last week a typical illustration of the effects of influence was furnished by the Yonkers (N. Y.) court. A more or less gilded and high rolling youth who filled his skin with "high balls" turned himself loose on the public highways and defied all laws of decency and safety. When arrested the rum-soaked young man was arrogant to an extreme degree and loud in his boasts. When brought up for trial, the influence of a wealthy and prominent father was brought to bear and "little Willie" escaped with a fine of \$50, "pa" promising further to take his automobile from him for one whole year of 52 weeks.

One advantage accruing from the introduction of modern manufacturing processes in connection with motor vehicle production is the elimination of packing gaskets in many joints about the motor and transmission where formerly they were absolutely necessary. With the general use of grinding machines in all well equipped shops, it is now not only an easy matter to secure water or gas tight joints without the use of gaskets, but their use provides a very economical way of securing such closures in an effective and satisfactory manner. Besides, they possess the advantage that in the event of their failing to hold as a result of careless handling, they may be rendered tight by introducing thin paper gaskets, such as may be prepared at no cost and with a minimum of labor.

A good opportunity for the display of ingenuity is revealed in the construction of such parts of the car as are subject to not infrequent renewal in such a way as to eliminate screw threads. At present, radiator caps and occasionally the covers to carburettor float chambers are secured properly without the use of threads. Yet with these exceptions, the idea does not seem to thread construction could be eliminated.

## **COMING EVENTS**

February 28-March 5, Kansas City, Mo.—Kansas City Automobile Dealers Association's fourth annual show in Convention Hall.

March 1-5, Sioux City, Ia.—Sioux City Automobile Club's first annual show in Auditorium.

March 5-12, Boston, Mass.—Boston Automobile Dealers Association's eighth annual show in Mechanics Building.

March 5-12, Cleveland, O.—Cleveland Automobile Club's eighth annual show in Central Armory.

March 5-12, Des Moines, Ia.—Des Moines Automobile Dealers Association's first annual show in Coliseum.

March 12-19, Syracuse, N. Y.—Syracuse Automobile Dealers Association's annual show in State Armory.

March 14-19, Cedar Rapids, Ia.—Automobile show in Auditorium.

March 17-19, Louisville, Ky.—Louisville Automobile Dealers Association's annual show in Armory.

March 19, Altadena, Cal.—Annual Pasadena-Altadena hill climb.

March 20, San Francisco, Cal.—San Francisco Motor Club's hill climb on Nineteenth avenue hill.

March 21-26, Indianapolis, Ind.—Indianapolis Automobile Trade Association's first annual show.

March 26-April 2, Montreal, Can.—Fourth National Automobile and Sportsmen's show.

March 26-April 2, Pittsburg, Pa.—Pittsburg Automobile Dealers' Association's annual show in Duquesne Garden.

March 28-29, Savannah, Ga.—Savannah Automobile Club's 675 miles endurance run to Jacksonville, Fla.

April 8-17, Los Angeles, Cal.—Inaugural meet on the new Los Angeles Motordrome.

April 23-29, Bangor, Me.—Eastern Maine automobile and motor boat show in Auditorium.

June 1, Berlin, Germany.—Start of Prince Henry tour, finishing at Homburg on 8th.

June 11, Wilkes-Barre, Pa.—Wilkes-Barre Automobile Club's annual hill climb on Giant's Despair, Wilkes-Barre Mountain.

July 2, Wildwood, N. J.—North Wildwood Automobile Club's roadability run from Philadelphia to Wildwood.

July 4, Wildwood, N. J.—North Wildwood Automobile Club's annual beach races meet on Ocean drive.

August 6, Wildwood, N. J.—North Wildwood Automobile Club's beach race meet on Ocean drive.

September 5, Wildwood, N. J.—North Wildwood Automobile Club's beach race meet on Ocean drive.

**PUTTING THE MOTOR CARS ON ICE**

**How It is Done Near Detroit, and the Purposes Served—Where Skidding is Real if not Earnest.**

While automobiling on the ice long since ceased to be a novelty, probably never has a frozen lake or stream been used as a regular testing ground until the Chalmers test-

stunts which can be performed only on the ice. Probably the most original of these is the automobile waltz—a terpsichorean effort more weird than the ghost dances on old Dartmoor Heath, and in which the cars whirl around and around.

“‘Fancy skidding’ is another of the testers’ ice stunts. Those who know skidding only as they have seen it on the asphalt pavements or on a race course have a great deal to learn about what a skid really is.

MOTOR CAR AND ICE BOAT GOING 40 MILES AN HOUR

crews this year inaugurated the practice. The person who fancies that the practice is akin to skating, however, is far wrong; for it is uncommonly rough work.

The Chalmers plant is situated on the shore of the Detroit River, about three miles below Lake St. Clair, famous the country over for its iceboat fleet. And when the ice becomes thick enough to sustain the big ice yachts, Chalmers testers forsake the famous Grosse Pointe track, where much of the summer testing is done, and take to the ice.

In these circumstances, testing cars becomes largely a sport. Races between testers, and between motor car and iceboat make the tester's task a thrilling one. The ice yachtsmen are very boastful of the speed they attain with their craft—fifty, sixty, and even seventy miles an hour they claim with the utmost nonchalance. And yet the Chalmers testers, using a “30” chassis, have beaten the fastest of the boats. The accompanying illustration shows one of the cars “trimming” the “Gretchen,” the champion of the lake.

“This speeding on the ice is about as hard testing as a car can get, too,” says a man who has witnessed it. “Between dodging the ice craft and bounding over hummocks on the ice, the cars get as much jolting in 25 miles of ice speeding as they do in an entire season of ordinary use. Aside from the speeding, the testers have some novel

On the ice, the Chalmers testers attain a speed of about 40 miles an hour and then suddenly start to coast with brakes set. It is not unusual for a machine to turn around ten and a dozen times, or skid sideways for a distance of 300 or 400 feet. It's the sort of performance that almost gives a man heart disease the first time he tries it.

**WHITE'S STOCK CAR SOLUTION**

**Cleveland Offers a Simple Suggestion that Would Prove Effective—How “Selling Races” Would Afford Proof.**

Despite the new A. A. A. rules, which permit stock cars to be altered and yet to be classed as stock cars, additional restrictions are necessary in order to ensure that cars taking part in contests, particularly in races, shall be bona fide stock cars, in the opinion of Windsor T. White, president of The White Co. As a solution—a happy and effective one—Mr. White proposes a rule whereby any machine entering in a contest may be claimed by any other entrant on the payment of the list-price of that car.

“I think no one will dispute the statement that there has been much ground for dissatisfaction with and distrust of the stock car racing situation,” said Mr. White, in disclosing the proposed reform. “The examination of contesting cars at race meets is necessarily of the most superficial character and generally discloses nothing more than that the cylinders are of the proper dimensions and that the general arrangement of parts is the same as in the stock model. Such an examination cannot reveal, for example, whether or not the racing car has a chrome-nickel steel crank shaft (when real stock cars of the same make use only common machine steel), or

“FANCY” SKIDDING ON THE FROZEN SURFACE OF LAKE ST. CLAIR

whether or not there has been a similar substitution of materials throughout.

“The public has had ample reason to be suspicious. For example, they have not understood why it was necessary for a ‘stock’ car which competed one week in New York to be rushed by express to compete in Minneapolis or New Orleans the

next. The ordinary citizen would imagine that any car in Minneapolis or New Orleans would fully size up to the true capabilities of the stock car and could be used.

"With this unsatisfactory situation confronting automobile racing, why should we not avail ourselves of the experience of a much older line of sport—namely, horse racing, wherein various protective measures have been devised for safeguarding the interests of the public as well as of contestants. I refer particularly to the regulations covering what are known as selling races. I believe that these regulations could be applied with advantage to all stock car racing in this country, with the result that any car entering a stock car race could be claimed by any other contestant in the race on payment of the list price of the car.

"By the enactment of such an amendment to the automobile racing rules, motor racing in this country would receive a tremendous boom. There are many manufacturers and agents who would be very willing to engage in various kinds of speed contests if they were assured that they would be confined to stock models. But at present, they feel that the cars which are being sent first to one city and then to another to engage in race meets are not bona fide stock cars. Under the proposed rule, any maker who engaged in a race and who suspected that one of the cars contesting against him was not a stock model, could simply bid it in at the list price and could quickly assure himself whether or not such was the case. With this regulation enforced, the practice of building specially constructed cars for racing purposes would be discouraged, there would be many more cars entering races and the public and the industry at large would benefit from the new conditions."

#### Cobe Cup Race Echoes \$7,703.

A jury in the Chicago Municipal Court last week returned a judgment of \$7,703 against Ira M. Cobe, former president of the Chicago Automobile Club, in favor of the F. J. Lewis Mfg. Co. The suit was for the balance due on a contract to resurface the roads at Crown Point, Ind., where the Cobe cup races were held last summer. Attorneys for the defendant contended the material used in resurfacing the roads was not suitable, and that after the racing machines had passed over the track a few times large holes appeared in the resurfacing. The plaintiff's attorneys argued that the resurfacing was done with roofing materials at the request of the promoters of the races, and that they did not guarantee the work.

#### Ridicule Kills "Popular Car Contest."

After all, there will be no "popular car voting contest," from New York to Boston or anywhere else. The whimsical affair projected by a New Yorker and so styled by him has been abandoned. It was to have started on Saturday next, but deserved ridicule killed it.

## CLIMBING AN UNCLIMBABLE HILL

### Californians Conduct an Unusual Contest, Likewise Two Ordinary Climbs and a Road Race—Fresno's Busy Day.

With a 65 mile road race in the morning and two hill climbing contests in the afternoon, Fresno, Cal., had its fill of automobile competition on Sunday, February 20th. As the event was the first of the season in California, it aroused a great deal of interest among the local people.

The road race, which, as stated, was held in the morning, was run over 65 miles of slippery highways, made so by heavy showers the night previous, and required the drivers to be exceedingly careful, which accounts for the slow time made. The event was known as the "Coalinga road race," the first prize being \$100.

E. B. Waterman, at the wheel of a Buick, was the third to be started, but he passed all his competitors and finished the race in 1 hour, 24 minutes, 18 seconds. Eichner, driving a Rambler, finished in 1 hour 28 minutes; C. W. Hobson, in an Elmore, was third, in 1:35:30, and Edward Waterman, in another Buick, crossed the line in 1:38:30. McDonald, in a Winton, had considerable trouble in keeping the road, but finally finished in 2 hours 16 minutes.

After luncheon the hill climbs were held, but the Marian incline, which originally had been chosen, was passed up because of its steepness; it was feared that none of the cars would be able to reach the top. Instead, another grade of 28 per cent. was chosen, and this proved more than steep enough for some of the contestants. In the class for small cars Edward Waterman, in a Buick, was the only one to make the ascent, but in Class B, for cars costing under \$2,000, four machines reached the summit. They were the Rambler, driven by Snyder; an Elmore, Kretzer's Buick and a Reo, entered by Cobb Evans. In the class for cars costing over \$2,000, R. Raymond, driving a Dorris, won; Ochs, Winton; Patton, Pope-Hartford; Evans, Dorris, and Eichner, Rambler, all reached the top, however.

There was another hill climb, when the cars were timed, and this resulted in some close competition, the results being as follows:

Raymond, Dorris, 49 seconds; E. B. Waterman, Buick, 39 seconds; Cousins, Mitchell, 56 seconds; Edward Waterman, Buick, 51½ seconds; Eichner, 69 seconds; McDonald, Winton, 48 seconds; Wheelock, Chalmers-Detroit, 52½ seconds; Kreicher, Buick, 37½ seconds; Reo, 51½ seconds; McDonald, Oakland, 40 seconds; Wheelock, Hudson, 43 seconds; Eichner, Rambler, 58 seconds. The distance of the incline is not stated.

Still another contest was termed an "endurance hill climb." Selecting a steep hill

which the committee did not expect any of the cars to climb, a line was drawn quite a way up the incline, and the car making the greatest distance was declared the winner. Honors again fell to Kretzer, in the Buick. McDonald, in a Winton, held the record for a time, but Kretzer passed the mark by a few feet. The Mitchell was another car close to the finishing distance.

#### No Patent Line in Competitions.

That no discrimination between licensed and unlicensed cars in automobile racing is to be permitted by the American Automobile Association is the decision which that organization has come to in relation to the question presented by the attempt of the Licensed Automobile Dealers' Association of Los Angeles, Cal., to bar unlicensed cars from its race meet at Ascot Park this week. The A. A. A. holds that racing is not a field in which patent differences can be brought to bear, and this view has been brought abruptly to the attention of the Los Angeles organization by the following telegram from S. M. Butler, chairman of the A. A. A. contest board:

"Conditional sanction 127 for March 5 and 6 is withdrawn if meeting is closed to all but Licensed cars. Contest board positively will not sanction anything but open meetings. New York Licensed dealers have decided not to enforce agreement rules in contest or racing matters. Los Angeles dealers had better do likewise."

#### Glidden Tour Affairs Already Stirring.

S. M. Butler, chairman of the A. A. A. contest board, officially has announced that a Chalmers car has been selected for the "pathfinding" purposes of the 1910 Glidden tour. It will leave Cincinnati about April 1st in charge of D. H. Lewis, who will "plot" the route through the eleven states which the tour will traverse, viz.: Ohio, Kentucky, Tennessee, Arkansas, Texas, Oklahoma, Missouri, Nebraska, Iowa and Illinois. F. Zirbes, in the Mitchell Ranger, already is going over the Glidden route. He left Cincinnati on Wednesday last, acting in an independent capacity. Although the tour does not start until June 15, and the entry blanks have not been issued, two formal entries already have been made, both by the Premier Motor Mfg. Co. This forehandedness will entitle the Premier entrants to wear Nos. 1 and 2 in the tour, as was the case last year.

#### France Fixes Voiturette Regulations.

The annual international race for light cars (voiturettes) will be held this year on a closed circuit in France on June 19th. The contest will be open for cars having engines of the following maximum bores: Single cylinders, 3.937 inches; two-cylinder, 3.15 inches; four-cylinder, 2.56 inches. No restrictions will be placed this year on the length of the stroke, but the minimum weight of the cars has been raised to 1,430 pounds.

## Boston Show to be Held Amid Spirea Van Houti

Boston's best effort in the automobile show line will be uncovered in Mechanics Building on Saturday afternoon of this week, 5th inst., when the eighth annual exhibition promoted by the Boston Automobile Dealers' Association will be inaugurated. This prediction is inspired in part by Manager Chester I. Campbell's own confident utterances on the subject and in part by reason of the fact that it will be the biggest show the "Hub"—of New England—ever has had. Without particularizing too deeply on the basis of the more or less uncertain preliminary list of exhibitors which has been issued by the management, it is safe to say that the exhibition will be graced by a greater number of exhibitors

spring water, confectionery and numerous publications are generously included in the roster. This, it may be said in passing, is a characteristic of Boston show programs, though less noticeable than formerly.

But however that may be, there is no question that the forthcoming show will afford the New England contingent as fine a display of cars as has been staged this year, and one replete with the newest products the industry has to offer. In addition to the regular lines which have been perpetuated successfully in Massachusetts and the sur-

and the Buffalo and Frayer-Miller commercials. One or two of these products have been shown recently at local exhibits in other sections of the country, but they will be new to the East. Likewise the following products will be disclosed which were not shown even in New York: Krit, Abbott - Detroit, Patterson, Standard, Warren-Detroit and Welch,

MECHANICS BUILDING, IN WHICH THE BOSTON SHOW WILL BE STAGED

of cars than attended either of the two New York shows, and nearly as many as were on hand at Chicago's big exposition. Counting accessories, the show promises to stand next to the Madison Square Garden show in point of gross bulk.

About 140 different varieties of motor car will be staged by 88 exhibitors. An even dozen stands will be given over to the exhibits of the motorcycle manufacturers, while the balance of 184 spaces will be relegated to the makers of parts, accessories and supplies, and the merchants in whatever wares in which the generous motorist may be persuaded to invest. It is only fair to add that a semblance of even greater magnitude than this is lent to the show list by reason of the fact that sundry dealers in

rounding states since they came into existence, there will be nearly a score of cars which have not been seen locally before, though they have appeared at one or more of the national shows of the current season. An enumeration of such products reveals the Black Crow, Demot, Everitt "30," Empire, Fuller, Firestone, Hudson, Kline, Mercer, Midland, Ohio and Selden; and the Chase, Hart-Karft, Martin, Randolph, Reliance and Sampson commercial vehicles.

Cars which are well known locally, but which have not been exhibited in their latest guise during the current show season, will be shown to the number of nine, including the Berkshire, British Napier, Grout, Herreshoff, Rainier, Velie, and Stanley steamer,

and Couple Gear commercial. The Morse—a brand new local product—and the Morgan, Garford and White commercial vehicles will be among the exhibits which will be new even to those who have looked in upon practically all of the shows of the season.

From the days of the earliest settlers about the shores of Massachusetts Bay down to the present decadent era, the trading instinct has been laden upon every breath of Back Bay fog. Hence, although the aborigines are long departed, and red, white and blue beads no longer find a ready market, there always is an easy sale for small wares, in addition to the staple products of the locality which, as everyone knows, are codfish and culture. So the ac-

## THE MOTOR WORLD

cessory departments of all Boston shows are departments to be approached with wallet pockets tightly buttoned up. For they boast all the wealth of products which the entire industry can muster, a goodly share of domestic manufactures, and a completeness and broadness of scope which is to be found at no other show. Also, due to the presence of a considerable number of retailers, it happens that the same lines may be displayed in several different sections at the same time, so that there is no escape for the guileless visitor.

As for decorations, Boston is going to do herself proud once more, according to the best of information. "Springtime" is to be the "motif" of the forthcoming show picture, just as the apple orchard, the Japanese garden and the Hall of Arches were the themes upon which former decorative schemes were based. To this end the Comley Conservatories have been drawn upon for color. Whether the Comley Conservatories are hothouses or millinery shops, the visitor must decide for himself. But certain it is that a profusion of the Spirea Van Houti, Lilacs (Natural Order Oleacea) and Tulips (Tulipa, Natural Order Liliaceae) will lend their festal hues to the adornment of the big exhibition building. Hedgerows, not fences, will divide the spaces in the main hall, wherein the stage will be set with a huge drop curtain affording a bright and natural vista the effect of which will be heightened by the surroundings of real greenery and blossoms. Hybrid Lilacs in full bloom will give the main tone to the coloring along the natural plane of sight, while to add the effect of distance and strengthen the impression of the rural setting, the walls below the balcony will be covered with scenic paintings forming a continuous landscape surrounding the hall. The balcony front, as well as the arched superstructure which will ornament it will be vine-clad and in harmony with the remainder of the setting.

Reminiscent of the apple orchard of 1907, then called the prettiest show ever staged, the exhibition hall will present the effect of just such another valued adjunct to the farm. The pillars with which the architect saw fit to despoil the room, will be covered with real bark; the exhibits will be separated by rail fences, just the kind that the future senators "down East" have to repair on Saturday afternoons; and there will be blossoms enough to make the illusion as complete as ever the ethics of show decoration possibly could require.

Even the basement, hitherto largely overlooked in "fixing up" for the show, is to be decorated this year, though in less elaborate style than the upper floors. Special finishes for the columns, ornamental hand rails for the exhibits, and a restaurant framed in the likeness of a vine covered brick inn, will serve to alter its ordinarily barren aspect. Needless to add that here, as everywhere else about the show, the floor coverings and signs will be of a uniform character.

The official list of exhibitors, their wares and their locations is as follows:

**Automobiles.**

Abbott-Detroit Boston Co. of New England (A44A)—Abbott-Detroit.  
American Automobile Co. (A26-37)—American, Detroit, Ohio and Krit.  
American-Simplex Co. (E426-7)—American Simplex.  
Atlas Motor Car Co. (B150)—Atlas.  
Austin Automobile Co. (A43)—Austin.  
Autocar Co., The (D311-12)—Autocar, pleasure and commercial.  
Bailey & Co., S. R. (A39)—Bailey electric.  
Berkshire Autocar Co. (D314)—Berkshire.  
Boston Electric Automobile Garage (341-6)—Detroit electric.  
Boston Motor Co. (C223)—Acme.  
Bowman Co., The J. W. (A3-7)—Stevens-Duryea and Everitt "30."  
British Napier Motors (D318)—Napier.  
Brush Runabout Co. (D321)—Brush.  
Buick Motor Co. (B137-41)—Buick.  
Butler Motor Car Co. (G200-8)—Rapid commercial.  
Buxton Machine Co., W. A. (C247)—Garford commercial.  
Castle, Inc., H. C. & C. D. (B131-2)—Lozier and Haynes.  
Clapp, Henry A. (B147-9)—Simplex.  
Columbus Buggy Co. (C234)—Firestone gasoline and electric.  
Corlew-Coughlin Co. (B105-340-347)—Paterson and Velie.  
Curtis-Hawkins Co., The (B143-8)—Speedwell.  
Dike, Francis (C327)—P-S.  
Dodge Motor Vehicle Co. (A11)—Pope-Hartford and Waverley electric.  
Dunham, Geo. J. & Co. (A44)—Royal Tourist.

Proctor Supply Co., G. H. (B100)—Mora.  
Rainier Co., The (B156)—Rainier.  
Rauch & Lang Carriage Co. (D330)—R&L electric.  
Regal Motor Co. (CB151)—Regal.  
Reliance Motor Truck Co. (C251)—Reliance commercial.  
Russell & Co., W. L. (A20)—Apperson.  
S. M. Supplies Co., The (B136-42)—Inter-State.  
Sampson Manufacturing Co., Alden (D319-323)—Sampson commercial.  
Sanders, N. S. H. (B133)—Anderson and Kline, and Chase commercial.  
Schacht Manufacturing Co., (C221)—Schacht.  
Selden Motor Car Co. (B135)—Selden.  
Smith, Fred S. (A15)—Mercer.  
South End Motor Car Co. (D315-6)—Empire, and Hart-Kraft commercial.  
Standard Motor Car Co. (D339-48)—Standard, and Grabowsky commercial.  
Stanley Motor Carriage Co. (A19)—Stanley steam.  
Stevens-Sowers Motor Car Co. (C214)—Fuller.  
Studebaker Brothers Co., of New York (A40-1; C218-9)—Studebaker gasoline and electric, pleasure and commercial.  
Thomas Motor Co., E. R. (G665)—Thomas.  
Tyler, F. J. (B116-7)—Maxwell.  
Underhill Co., The (A6-10; C241-3)—Knox pleasure and commercial.  
Welch Motor Car Co., of New England (D314)—Welch.  
White Co., The (A5-9; C216-7)—White gasoline and steam.  
White-Ware & Co. (D317)—Corbin.  
Whitten-Gilmore Co., The (B108-10)—Chalmers and Hudson.  
Wing, F. E. (B122-3)—Marmon.  
Winton Motor Carriage Co. (A48)—Winton.

**Motorcycles.**

American Motor Co. (G600-3)—M-M.  
Aurora Automatic Machinery Co. (G617-8)—Thor.  
Consolidated Manufacturing Co. (F577-8)—Yale.  
Crouch Motor Co. (F565)—Crouch.  
Emblem Mfg. Co. (F563B)—Emblem.  
Excelsior Supply Co. (F567)—Excelsior.  
Hendee Manufacturing Co. (F572-3)—Indian.  
Miami Cycle & Mfg. Co. (F579)—Miami.  
Merkel-Light Motor Co. (F581-2)—Merkel and Light.  
Pierce Cycle Co., The (F575-6)—Pierce.  
Reading Standard Co. (G505-7)—RS.  
Reliance Motorcycle Co. (F580)—Reliance.

**Accessories.**

Aetna Life Insurance Co. (G612)—Insurance.

- Adams & Co., J. Q. (G656)—  
 Ajax-Grieb Rubber Co. (E549-50)—Ajax tires.  
 Ajax Trunk and Sample Case Co. (D302)—Leather trunks and tire cases.  
 American Ever Ready Co. (F526)—Ever-ready batteries, lamps and tire specialties.  
 American Storage Battery Co. (D300A)—Accumulators.  
 American Storage Battery Co. (D300A)—Accumulators.  
 Arseno Electric Co. (G613A-A)—Electric specialties.  
 Atlas Rubber Co. (C245)—Non-puncturable inner tubes.  
 Atwater-Kent Manufacturing Works (E554)—Timers and electric horns.  
 Auburn Auto Pump Co. (G608B)—Automatic tire inflating pumps.  
 Austin & Doten (E429B)—Pumps.  
 Auto Improvement Co. (E5270)—Accessories and specialties.  
 Auto Supplies Co.—Supplies.  
 Baker, Roy C. (C229)—  
 Baldwin Chain & Mfg. Co. (F555)—Baldwin chains and recoil checks.  
 Baldwin Tumbler Carrier Co. (G600AA)—Specialties.  
 Batavia Rubber Co. (G608A)—Batavia tires.  
 Bi-Motor Equipment Co. (D353)—Supplies.  
 Bosch Magneto Co. (F568)—Bosch magnetos.  
 Boston Auto Gauge Co.—Triumph gasoline gauges.  
 Boston Tire & Rubber Co. (F564A)—Dayton Airless tires.  
 Bowser & Co., S. F. (E432-448)—Gasolene and oil storage systems.  
 Boyd, F. Shirley (E446)—Supplementary Spiral springs.  
 Brunner Mfg. Co. (F550AA)—  
 Burn Boston Battery Co. (E428)—Sealed liquid batteries.  
 Burroughs Remountable Rim Co. (F569A)—Burroughs Remountable rims.  
 Champion Ignition Co. (D344)—Ignition supplies.  
 Chase & Co., L. C. (F508-9)—Top and cover materials.  
 Clayton Air Compressor Works (D303-AA)—Clayton non-blowout tire valves.  
 Cleveland Speed Indicator Co. (G619)—Speed indicators.  
 Coes Wrench Co. (E419)—Coes wrenches.  
 Coates Clipper Mfg. Co. (C227)—Flexible shafting.  
 Colton Combination Tool Co. (E414A)—Combination utensils.  
 Columbia Lubricant Co., of New Jersey (E4401)—Non-fluid oils.  
 Columbia Tire & Top Co. (D326)—Tops, tire cases and covers.  
 Continental Caoutchouc Co. (E416)—Continental tires.  
 Connecticut Oil Co. (D354)—Lubricants.  
 Consolidated Rubber Tire Co. (F528-9)—Tires.  
 Connecticut Telephone & Electric Co. (F501)—Connecticut coils and timers.  
 Couch & Seeley Co. (G624)—Casgrain speed indicators.  
 Coward, John D. (E442)—Star speedometers and E & M wind shields.  
 Craig Co., David (D365)—  
 Cramp & Sons Ship & Engine Building Co., Wm. (F539)—Bronze castings and components.  
 Crane Co., L. M. (C221)—  
 Culver-Stearns Manufacturing Co. (D350-AA)—  
 Daniels, Smally (F569B)—  
 Diamond Rubber Co., The (E420)—Diamond tires.  
 Dixon Crucible Co., Joseph (F514-5)—Graphite lubricants.  
 Dover Stamping & Manufacturing Co. (E449)—Drip pans, funnels and measures.  
 Downing, C. J. (E408-9)—Horns, tire accessories and holders.  
 Duren & Kendall (C335)—Vacuum cleaners.  
 Eagle Oil & Supply Co. (F556A)—Lubricants.  
 Eastman, W. E. (C244)—  
 Eco Mfg. Co. (E443)—Horns.  
 Eisner & Co., Harry (F570B)—  
 Electric Storage Battery Co. (F510)—Accumulators.  
 Empire Tire Co. (E430)—Empire tires.  
 Federal Rubber Co. (F500)—Rex ignitors and Bliss coils.  
 Fiat Repair Co. (D309)—  
 Firestone Tire & Rubber Co. (F506-7)—Firestone tires.  
 Fisk Rubber Co., The (E436)—Fisk tires.  
 Flentje, Ernst (F533AA)—Shock preventors.  
 Forbes, W. J. (G620)—K. W. Magneto.  
 Ford Co., Percy (E400-7)—Specialties.  
 Fox Metallic Tire Belt Co. (F530)—Non-skid chains.  
 G & J Tire Co. (F556-7)—G & J tires.  
 Gabriel Horn Mfg. Co. (E444-5)—Gabriel exhaust horns and Foster shock absorbers.  
 Gasoline Motor Efficiency Co. (E570)—Carburettor attachment.  
 Gilbert Mfg. Co. (F558)—Tire jackets, lamp jackets and rubber cloth specialties.  
 Goodrich Co., The B. F. (540-1)—Goodrich tires.  
 Goodyear Tire & Rubber Co.—Goodyear tires.  
 Gray & Davis (E433)—Lamps.  
 H. I. K. Co. (C220A)—  
 Harriman Engine Co. (D304-7)—Rotary motors.  
 Harris Oil Co., A. W. (F519-20)—Lubricants.  
 Hart & Fuller,  
 Hartford Rubber Works Co. (F537-8)—Hartford tires.  
 Hartford Suspension Co. (F542)—Tru-fault-Hartford shock absorbers.  
 Harvey Co., Arthur C. (C224)—Metals.  
 Havoline Oil Co. (F559)—Lubricants.  
 Heinze Electric Co. (F536)—Ignition specialties.  
 Hertz & Co. (F513)—Magnetic and ignition devices.  
 Hillman Auto Supply Co. (F531)—Supplies.  
 Hilton Mfg. Co. (D343)—  
 Hoeffcker Co., The (F516-7)—Hoeffcker speed indicators.  
 Holt & Beebe (D357a-a)—Electric lamps.  
 Hopewell Bros. (F509)—Tire casings.  
 Howard Detachable Rim Co. (D359)—Howard detachable rims.  
 Hydraulic Oil Storage Co. (D336)—Gasolene storage systems.  
 Ideal Wind Shield Co. (F563A)—Wind shields.  
 Iver Johnson Sporting Goods Co. (F555)—Accessories.  
 Jones Speedometer Co. (F502)—Jones speedometers, taximeters and live maps.  
 Jordan, R. W. (D314a-a)—  
 Kellom & Co., C. F. (G623)—Lubricants.  
 Kemble, A. M. (E415a-a)—  
 Kempshall Tire Co. (F570a)—Kempshall tires.  
 Kennedy Carburetor Co. (E402)—Kennedy carburetors.  
 Keystone Lubricants Co. (D332)—Lubricants.  
 Kilgore Mfg. Co. (G604)—Shock absorbers.  
 Knapp-Greenwood Co. (G615)—Shock absorbers.  
 Lavalette & Co. (E413)—Eisemann magnetos.  
 Leather Tire Goods Co. (F544)—Woodworth detachable tire treads.  
 Leland & Co., W. H. (E417)—Worcester spark coils and grinders.  
 Lovell-McConnell Mfg. Co. (E415a)—Klaxon horns.  
 Lunt-Moss Co. (D320)—  
 Lyon Non-Skid Co. (D358a-a)—Non-skid device.  
 Marburg, Theo. H. (D352)—Mea magneto.  
 Metcalf Machine Works, Geo. A. (D355-B)—  
 Mezgar Inc., C. A. (F504)—Soot-Proof spark plugs and automatic wind shields.  
 Michelin Tire Co. (E418)—Michelin tires.  
 Miller, Chas. E. (F566)—Brampton chains, accessories and supplies.  
 Moore-Smith Co. (G651)—Fur garments.  
 Morgan & Wright (E438)—M & W tires.  
 Motor Specialties Co. (D301)—  
 Murray Co., P. A. (D301; 324)—Tops.  
 Mutty Co., L. J. (G609)—Top and cover materials.  
 New York & New Jersey Lubricant Co. (E503)—Non-fluid oils.  
 National Carbon Co. (E439)—Dry batteries.  
 Nightingale Whistle Co. (G614; 625)—Exhaust whistles.  
 Noonan Tool & Machine Co. (D355a)—Special tools and utensils.  
 Oakley Steel Foundry (E429a)—Metals.  
 Oulton Motor & Mfg. Co. (C246)—Motors.  
 Panhard Oil (E407)—Lubricants.  
 Pantasote Co., The (F523-4)—Top and upholstery materials.  
 Parker Motor Co. (D352)—Motors.  
 Pennsylvania Rubber Co., of New York (E423)—Pennsylvania tires.  
 Perfection Wrench Co. (G616)—Wrenches.  
 Pittsburg Auto Equipment Co. (F564B)—Pittsfield Spark Coil Co. (E431)—Ignition specialties.  
 Polson, W. F. (E410-11)—Wind shields.  
 Post & Lester Co. (E424)—Supplies.  
 Proctor Supply Co., G. H. (C243)—Republic tires.  
 R. I. V. Bearings (F406)—Anti-friction bearings.  
 Randall Faichney Co., The (F512)—Jericho exhaust horns, B-line grease guns and Bing spark plugs.  
 Rayvello Chemical Co. (D351a-a)—  
 Reliance Speedometer Co. (E426a)—Speed indicators.  
 Remey Electric Co. (F547-8)—Magnetos.  
 Republic Rubber Co. (F545)—Republic tires.  
 Robinson & Son Co., W. C. (F525)—Lubricants.  
 Rogers, Leo N. (D367)—  
 Russell & Co., T. W. (E427a-a)—Accessories.  
 Rutherford Rubber Co. (G622)—Sterling tires.  
 Sage Trunk Co. (G609a-a)—Trunks and suit cases.  
 Salmon & Co., John A. (E447)—Monograms.  
 Sawyer Oil Co., Howard B. (D366)—Lubricants.  
 Seamless Rubber Co. (F532)—Tires.  
 Shawmut Tire Co. (E450-1)—Tires.  
 Sheldon Axle Co. (G624)—Axles.  
 Simmons, Hatch & Whitton Co. (G654)—Sireno Co. (G610-11)—Sireno horns.  
 Smith Co., Wm. J. (E414B)—Tools.  
 Spaulding Mfg. Co. (G653)—  
 Splittdorf, C. F. (E422)—Ignition appliances.  
 Stackpole Battery Co. (E414a-a)—Dry batteries.

Standard Thermometer Co. (E428B)—Standard Speedometer.  
 Standard Tire & Rubber Co. (F500A)—Federal tires.  
 Standard Welding Co. (E421)—Parts.  
 Star Auto Locks (C220B)—  
 Sterling Hardware Co. (D358)—  
 Stromberg Motor Devices Co. (F551-3)—Stromberg carburettors.  
 Suburban Concrete Block Co. (D368)—Garage material.  
 Swinehart Tire & Rubber Co. (F543)—Swinehart tires.  
 Teel Mfg. Co. (D329)—Tire cases and top materials.  
 U. S. Light & Heating Co. (F546)—National storage batteries.  
 Underhay Oil Co. (G621)—Lubricants.  
 Vacuum Oil Co. (F521-2)—Lubricants.  
 Valentine & Co. (F533)—Varnishes.  
 Veeder Mfg. Co. (E437)—Odometers and tachometers.  
 Victor Auto Supply Co. (F511)—Tops and wind shields.  
 Victor Metals Co. (D329)—Metals.  
 Voorhees Rubber Co. (G613)—Tire repair outfits.  
 Ward & Sons, E. T. (D322-3)—Metals.  
 Warner Gear Co. (E415)—Gears and parts.  
 Warner Instrument Co. (E435)—Auto-Meters.  
 Weed Chain Tire Grip Co. (F505)—Weed chain tire grips.  
 Westinghouse Electric & Mfg. Co. (D356-7)—Electric vehicle power plants, batteries and charging outfits.  
 White & Bagley Co. (E425)—Lubricants.  
 Whitney Mfg. Co. (F518)—Whitney chains and keying systems.  
 Whittaker Chain Tread Co. (F553a-a)—Non-skid appliances.  
 Wilkinson & Co., A. J. (F560-1)—Machinery and tools.  
 Y. M. C. A. Auto School (G653)—Demonstrating exhibit.

#### Boston Promoter to Hold Overflow Show.

A new Museum of Fine Arts having been built in another part of the city, the ornamental structure which graces the eastern side of Copley Square, in Boston, now is available for exhibition purposes, and in that capacity has been thrown open for an "independent" automobile show, which is announced to run during the period of the regular exhibition in Mechanics' Hall, from Saturday next, 5th inst, for one week. The affair is being promoted under local unofficial auspices and is offered as a safe harbor of refuge for such intending exhibitors as have been crowded out of the dealers' show at the old stand a little farther out on Huntington avenue.

#### Solars at a Mistaken Sacrifice.

Due to the use of the term "per pair," when the word "each" was intended, in a recent advertisement of the Badger Brass Mfg. Co., it was made to appear that several types of Solar lamp, Nos. 1077, 1078 and 1079, were being sold in pairs for the price of a single lamp. That, despite their great facilities, the Solar people have not been able to perform anything quite so remarkable should have been apparent, for as a matter of fact the cost of material and other things inclines to the increase of lamp price instead of to their reduction.

## PARIS NOW MAY HAVE TWO SHOWS

### Manufacturers' Association and the Automobile Club of France at Odds—Each Schedules a Show.

While last year Paris had no automobile show at all, it is likely that this year there are to be two of them in succession, inaugurated and supported by two different factions who do not appear to agree very well, a situation not unlike that which prevailed in New York a few years ago having been created.

Officially, of course, the Automobile Club of France has all the prestige of years behind it, and with the help of its syndical chamber proposes to hold its Salon in the Grand Palais in December next, Senator Gobron, head of the automobile firm of Gobron-Brillie, having been chosen commissary general of the exhibition, in place of M. Rives, who managed the Salon in former years.

On the other hand, the new Syndical Chamber of Motor Car Makers, which includes nearly all the French automobile manufacturers, has entered into an arrangement with the Industrial Association of Aerial Locomotion to organize a joint Salon at the end of October or beginning of November. The opinion prevails among both the French public and the manufacturers, that two shows are not needed, nor even wanted, and that the A. C. F. will find itself in a very difficult position, being able, it is said, to exhibit only a very few cars and accessories, while the rival show will have a plentitude of exhibits of all kinds and be sure to be patronized extensively by the public. But so strong is the social influence and prestige of the A. C. F. that the rival association actually asked the Club's sanction of the show, and even endeavored to induce a prominent member of the latter, Baron Van Zuylen, to accept the presidency, but without success.

At the present moment the members of the A. C. F. want the Motor Car Makers to affiliate themselves with the club and to exhibit jointly under club management, while the Motor Car Makers are trying to induce the few remaining automobile firms still faithful to the A. C. F., to abandon its cause and to exhibit under the Motor Car Makers management.

#### Bothering the Bay State Taxicabs.

In Massachusetts a peculiar situation has arisen over the recent order of the State Commissioner of Weights and Measures. that all taxicabs are to have their dials illuminated at night. Most of the cabs are gasoline driven and the expense of installing lighting plants would be so great that many of the taxicab companies are seriously considering the advisability of going back to the ordinary motor cab service at the

old rates, which were in excess of what is now charged for taxicab hire. The order has already led two of the smaller companies to take off the taximeters and to run their machines simply as motor cabs. The head of one of the larger firms said that after careful figuring he had come to the conclusion that it would cost from \$4,000 to \$5,000 to equip his cabs with lights for the dials, and that his concern could not afford to do this under the present conditions of taxicab hire.

As a temporary compliance with the order one of the companies has given to each of its drivers a pocket flash light with which he is compelled to illuminate the dial at the end of each trip. As the taxicabs of New York are getting along without permanent lamps in front of the dial, it is thought that the Massachusetts State Commissioner will modify his order so that the flash light may be regarded as legal.

#### Proper Names Now are Common Nouns.

Automobile terminology affords a fine example of the way in which a language may be enriched through the international development of the arts. Tracing the origin of the noun "chauffeur," for example, was a favorite pastime of the daily press for several years; the final and probably correct version placing the term upon the heads of a certain class of brigands which at one time haunted the outlying districts of old France. The popular French and English appellation for the universal jointed propeller shaft, "cardan," it now appears, is hardly more modern in its derivation. After Cardano, the sixteenth century Italian inventor of a certain type of shaft having universal joints, such members came to be known in France as "arbres a la cardan," whence cardan shafts and cardan joints are a natural outcome. Similarly, "carter," the popular French name for a gear box, instead of being of local origin, as might be supposed, is traced to one Harrison Carter, an Englishman, who many years ago invented a gear case for enclosing the driving chain and sprockets of a bicycle.

#### Novel Taxicab "Strike" Brings Results.

Drastic, but effective, means of relief were employed a few weeks ago by the taxicab drivers of Leipzig, Germany, when the police began to arrest them for trivial offenses and fine them heavily in each case. The police persecution had lasted for several days, when the chauffeurs suddenly took the bull by the horns, and at a pre-arranged hour disappeared with their cabs from the streets. For that day the transportation problem in the Saxon city was a difficult one, and the police heard a rather variegated lot of uncomplimentary remarks made by the suffering public. As a result an order was immediately given out by the highest police official to cease unwarranted persecution, and the next day everything went along smoothly. Rarely, if ever, has a difficulty been settled more satisfactorily.

## Six More Local Shows Occupy the Stage

GENERAL VIEW OF DENVER SHOW IN THE AUDITORIUM

### Denver's Auditorium Not Large Enough for its Show

Practically every city and town in Colorado, as well as many outside the borders of the Centennial state, was represented in Denver last week among the throngs of visitors who journeyed to the Mile High city for the second annual automobile show of the Denver Motor Club. Staged in the Auditorium, the city's largest building, the exhibition opened on Wednesday, 23rd ult., and continued for the rest of the week. Overflowing with cars and accessories, the big structure was not large enough to accommodate all who wished to exhibit, and in consequence there were a dozen private shows at local salesrooms. The display was composed of 63 exhibits, all told, about 20 of which were of cars. There were over 200 different machines on exhibition—which was in the nature of high water mark in local show annals.

In keeping with the greater magnificence and splendor of the show itself, the decorations likewise were of an elaborate and beautiful nature. On the main floor, which

was carpeted with green cloth, white lattice pillars marked with greenery marked off the spaces of the exhibitors, the pillars being connected by streamers of blue and white lights. Around the lower balconies at intervals were placed plaster casts of the club emblem—an artillery wheel surmounted by an eagle with outspread wings. On the front of the galleries were placed shields with American flags, and the boxes were similarly decorated. Numerous colored electric bulbs were scattered throughout the hall, over 10,000 lights being used, and when aglow the effect was one that could not well fail to impress the visitor.

Although belonging to the motor club, eleven prominent dealers decided to hold shows at their salesrooms instead of incurring the expense of taking space at the show, and dressed their salesrooms in elaborate form, all using the same color scheme of purple and white, with floral effects. Open house was maintained throughout the week, concerts being given at several establish-

ments, and these private shows also drew large crowds. Those who gave private exhibitions were the following: Tom Botterill, Pierce-Arrow and Pope-Hartford; J. H. McDuffee, Chalmers and Woods electric; McFarland Auto Co., Packard and Buick; Colorado Auto Co., Cadillac; W. W. Barnett, Alco and Stoddard-Dayton; Charles Bilz, Franklin; Felker Auto Co., Stevens-Duryea and Waverley electric; Vreeland Bros. Auto Co., Moon; Central Motor Car Co., Stearns; W. S. Newson, White; A. H. DeGaston, Knox.

With an attendance running up to 15,000 on the opening night, and holding strong on the following days, all previous show records were broken. Not to be outdone by energetic show committees of other cities who provided aeroplanes as drawing cards, the Denverites also had one of the ethereal vehicles on exhibition.

The exhibitors were as follows:

Gasolene cars—E. R. Cumbe, Rambler and Mitchell; Overland Auto Co., Apperson.

Overland, Marion and Winton; Krebs-Covington Auto Co., Haynes, E-M-F. and Flanders; Johnston Motor Sales Co., Premier, Falcar, Peerless and Everitt "30"; Studebaker Colorado Vehicle Co., Studebaker-Garford; Sanford Motor Car Co., Croxton-Keeton; Mathewson Auto Co., Thomas, Oldsmobile, Reo, Oakland, Ohio, Randolph and Reliance trucks; E. W. Swanbrough, Hupmobile; Commercial Motor Car Co., Buffalo trucks; Ford Motor Co., Ford; Welch Motor Car Co., Welch; A. T. Wilson, Kisselkar, Black-Crow and Empire; Havens Motor Car Co., Dorris and Frayer-Miller

trucks; Colburn Auto Co., Colburn and Renault; Michaels & Middlekauff, Parry; F. A. Trinkle, Brush; John Deere Plow Co., Velie; Arapahoe Motor Co., Elmore.

Electric vehicles—Overland Auto Co., Baker; Krebs-Covington Auto Co., Detroit; Studebaker Colorado Vehicle Co., Studebaker; Mathewson Auto Co., Columbus; Fritchle Auto & Battery Co., Fritchle.

Motorcycles—Mead Autocycle Co., Excelsior; Pierce Motorcycle Co., Pierce; Fry & McGill Motor Supply Co., Indian; Boot Motorcycle Co., R-S; Whiting & Wunderlee, Harley-Davidson; New Era Auto Cycle

Co., New Era; George Mayer Hardware Co., Yale.

Accessories—Fry & McGill Motor Supply Co., Great Western Oil Co., Colorado Tent & Awning Co., Meek Trunk & Bag Co., E. Lewis, Westinghouse Electric & Mfg. Co., Denver Gas & Electric Co., Brooke Airless Tire Co., Carstarphen Electric Co., Boss Rubber Co., Whiting & Wunderlee; Globe Storage Battery & Auto Co., Continental Oil Co., Raymond Electric Vaporizer Co., Paine Brier, Hendrie & Bolthoff, Pioneer Motor Supply Co., H. Tenwinkle, George Kindell.

## Los Angeles' "Licensed" Show Held in a Tented Forest

Nestling in a forest of giant redwood trees, beneath a canvas canopy studded with thousands of electric lights, more than 150 of the best known cars of the United States, arrayed in gorgeous attire, together with a generous array of accessories, was the scene which greeted the eye at the opening of the first annual show of the Licensed Automobile Dealers of Los Angeles, Cal., at Fiesta Park, on the 19th ult. There have been numerous shows in the West and on the Coast, each eclipsing its predecessor in lavishness, but for the most gorgeous and entrancingly bewildering motor exhibition ever held west of Chicago the initial effort of the Selden camp in the Angel City is entitled to premier honors. Unique in its housing 'neath walls of canvas which was permitted by the delightful climate of the region, the Los Angeles licensed show was a veritable fairyland.

So common has it come to be that the building selected for an automobile show has been crowded to the bursting point that the licensed dealers when laying out the show hit on a bold plan of holding it in a mammoth tent, where there would be ample room for all, and the plan was a huge success. The broad aisles were like avenues, and at no time were there any signs of congestion. Under a canopy of 90,000 square feet of canvas and a floor area nearly as large the 52 exhibitors of cars and 35 accessory concerns were gathered, with plenty of elbow room on all sides. With the rows of giant redwoods nestling in a green valley and surrounded by canvas scenes of snow

capped mountains and foaming waterfalls, were it not for the motor cars on every hand one easily could imagine himself in the wild and rocky fastnesses of the Golden State.

Hiding the uprights of the tent were redwood branches skilfully interwoven, while the posts were treated with an imitation redwood bark to further aid in the transformation.

Around the four walls was an immense scenic wall of canvas over 1,000 feet long and 12 feet high, representing a forest, which heightened the general effect.

Beginning with the opening night, when the elite were out in force and over 7,500 people passed into the tent, until the close of the show on the 26th ult., all previous daily attendance records were broken.

The exhibitors were as follows:

Gasolene cars—Bekins Motor Co., Atlas; Big Four Auto Co., Regal and Corbin; Bireley & Young, Columbia; W. E. Bush, Pierce-Arrow; Henry & Brown Motor Car Co., Knox; Eastern Motor Car Co., Stevens-Duryea; Elmore Motor Car Co., Inc., Elmore and Stearns; Golden State Garage, Palmer-Singer and Simplex; Greer-Robbins Co., Inc., Mitchell; R. C. Hamlin, Franklin; H. O. Harrison Co., Inc., Peerless and Everitt "30"; W. D. Howard Motor Car Co., Winton; Howard Auto Co., Buick; Don Lee, Cadillac; Lord Motor Car Co., Inc., Studebaker, E-M-F. and Flanders; Los Angeles Motor Car Co., Inc., Locomobile; Maxwell-Briscoe Los Angeles Co., Maxwell; Mercer Auto Co., Mercer; Miller &

Williams, Pullman; Nash & Fenimore, Lozier; Oakland Automobile Co., Oakland; Renton Motor Car Co., Matheson and Overland; W. R. Ruess Automobile Co., Pope-Hartford; Schwaebe-Atkinson Motor Co., Inc., Premier and Randolph trucks; Shafer-Goode Motor Co., Inc., Glide; Smith Bros., Mora; Stoddard-Dayton Motor Co., Inc., Stoddard-Dayton; Charles H. Thompson, Jackson; Woolwine Motor Co., Inc., Cartercar, Oldsmobile and Rapid trucks; Western Motor Car Co., Inc., Packard, Chalmers and Hudson; Wilson & Buffington, Thomas and Moline; Wade Motor Sales Co., Marmon.

Electric vehicles—California Electric Garage Co., Detroit and Columbus; Elmore Motor Car Co., Babcock; Charles H. Thompson, Baker.

Motorcycles—William H. Hoegee Co., Yale; Indian Motorcycle Co., Indian; New Era Cycle Co., New Era.

Accessories—Shugers Mfg. Co., Earl Auto Works, Auto Inner Casing Co., Non-Puncture Inner Casing Co., American Ever-Ready Co., Jackson-Eno Rubber Co., Barnard Specialties Co., Western Mechanical Works, Western Rubber & Supplies Co., Brown & Wall, Chanslor & Lyon Motor Supplies Co., E. A. Featherstone Co., Seeley Specialties Co., Noiseless Automatic Wind Shield Co., Perkins Wind Shield Co., Carl Entomann Jewelry Co., Beacon Auto Body Co., Martin Shock Absorber Co., E. H. Crippen & Co., Pico Auto & Carriage Co., H. & C. Tire Inflator Co., Berlin Dye Works.

## Kansas City's Second Show a Whaling Big Affair

Transformed into an indoor park of elms and apple trees for the occasion, the big Convention Hall in Kansas City, Mo., for the second time this year, is this week the scene of an automobile show. It is the fourth annual function of the Kansas City Automobile Dealers' Association, and despite the defection of a number of dealers from the organization last fall, who held a show in January, the present exhibition surpasses in size and splendor all its predecessors, and is one of, if, indeed, it is not the largest local affair ever held anywhere.

Despite the immense area of the big building, which is one of the largest structures in the West, it is practically bulging with automobiles and appurtenances, there being 81 car exhibits and 30 accessories displays. Over 300 different models of cars are staged.

In order to make room for all the exhibitors who were allotted space the show committee had to install considerable additional temporary flooring. In the balcony all the seats were removed and a platform 22 feet wide with a bridge in front of the band

stand was erected. This extra space together with the main floor gave a total of 40,000 square feet of space for exhibition purposes and there was none to spare. In fact a number of prospective exhibitors were unable to obtain space.

Among the cars on exhibition are several which are uncovered for the first time; they include the Henry, the Lanpher wagon, and the Economy truck. Hailing from Muskegon, Mich., the Henry is a four cylinder machine with cylinders cast in pairs and a power rating of 35 horsepower. Power

is transmitted through a multiple disc clutch to a three speed selective gearset mounted amidships, and the final drive is through an enclosed shaft to a floating rear axle. The power plant is mounted on a pressed steel double dropped frame with 116 inches wheel base, the wheels being 34x4 inches all around. The suspension is on semi-elliptic front and three-quarter scroll rear springs, the latter being extra long. There are two sets of brakes, both the service and emergency systems being mounted on the rear wheels.

The Lanpher is a light delivery wagon distinguished by high wheels and solid tires; it has a double opposed engine and planetary transmission placed amidships. The final drive is by chains.

In the matter of decorations the second Kansas City show suggests the touch of a magic wand. On entering the hall the eye is greeted by a striking white automobile drawn by a score of doves and driven by a bewitching, but inanimate, female, which has been christened "Matoria," the whole piece de resistance being suspended from the ceiling, or rather from the sky, for the roof has been transformed into a night sky of a dark ultra-marine hue and so shaded and illumined by ingeniously arranged lights consisting of electric stars, that the impression is conveyed that it really is an outdoor scene with the genuine sky above. Over the rear seats of the car, which is of open type, is a framework which is banked with flowers, as are the other outlines of the vehicle. The arrangement floats just above the tree tops. At the other end of the building and similarly suspended, but more apparently in its element, is an aeroplane which is lacking in the possession of a

cote of doves to lend a flight effect. On the main floor are over 100 apple and elm trees, the former with blossoms attached and suggesting an apple orchard in spring time. To lend further an aspect of genuineness to the setting, the odor of apple perfume from gallons of imported scent is wafted through the hall by numerous electric fans, while hundreds of canary birds concealed in the trees make more or less music.

The exhibitors are as follows:

Gasolene cars—Taylor & Taylor, Herreshoff; Boyd Automobile Co., Haynes and Sterling; Great Western Automobile Co., Great Western; Woodward Automobile Co., Knox; Hollister Motor Car Co., Great Smith; Lake Motor Car Co., Premier and Stearns; Brooke Automobile Co., Lexington; McIntyre Automobile Co., McIntyre; Kansas City Vehicle Co., Gleason; Monarch Motor Car Co., National, Demot and Cole "30"; Empire Automobile Co., Empire; Kendall Motor Car Co., Pennsylvania; Jackson Automobile Co., Jackson; Rambler Automobile Co., Rambler; Hall Bros., Dorris and Pierce-Racine; Standard Motor Sales Co., Matheson; Lambert Motor Car Co., Henry; Weber Engineering Works, Continental; Selden Motor Sales Co., Selden; Cartercar Motor Co., Cartercar; Enger Motor Car Co., Enger; Inter-State Motor Co., Inter-State, Parry, Warren-Detroit, and Buffalo trucks; Joseph W. Reid, Glide and Westcott; Regal Motor Car Co., Regal; Hunnewell-Scott Motor Car Co., Lozier; Genung Motor Car Co., Falcar; Western Motor Car Sales Co., Speedwell, Davis; H. G. Kirkland, Anhut; Automobile Sales Co., Pope-Hartford; Bond Motor Car Co., Everitt "30"; Pullman Motor Car Co., Pullman; Zartman-Tuller Co., American and Chad-

wick; Bergers Auto Co., E-M-F. and Flinders; L. C. Motor Car Co., Palmer-Singer; Western Commercial Car Co., Reliance, Economy, Monitor and Gramm-Logan trucks; Demster Machinery Co., Locomobile; Post Motor Car Co., Kisselkar; A. L. Bennett & Co., Petrel; Long Motor Car Co., Brush; Missouri Valley Auto Co., White; Kansas City Rapid Motor & Transportation Co., Black-Crow; Ryer & Peycke, Abbott-Detroit and Halladay; A. E. Snow, Beyster-Detroit; Kansas City Auto Truck Co., Frayer-Miller; Meils Motor Car Co., Lambert; Ray-Histed Motor Car Co., De Tamble and Chase trucks; A. M. Wiker, Lanpher; Auburn Motor Car Co., Auburn; Franklin Automobile Co., Franklin; Schacht Motor Car Co., Schacht; Auto Livery Co., Fuller and Whiting; Bradley-Alderson Co., Cameron, Overland and Marion.

Steam cars—Missouri Valley Auto Co., White; Hunnewell-Scott Motor Car Co., Stanley.

Electric vehicles—Woodward Automobile Co., Babcock; L. C. Motor Car Co., Baker; Inter-State Motor Co., Broc.

Motorcycles—Yale Motorcycle Co., Yale; E. B. Saufly, Excelsior; American Motorcycle Co., American.

Accessories—Vesta Battery Co., Fidelity Oil Co., Western Oil Pump Co., Phoenix Auto Co., Kansas City Rubber Belting Co., Mercantile Lumber & Supply Co., W. F. Polson, Triple-Tread Tire Co., Universal Sales Co., Kansas City Auto Supply Co., Excelsior Supply Co., Fireless Cooker Co., Columbia Steel Tank Co., Star Speedometer Co., Multi-Ball Spark Plug Co., Vacuum Cleaning Co., Butler Mfg. Co., Kansas City Vehicle Co., Auto Specialty Co., Pioneer Top Co.

## Milwaukee's Show and Fountain "Played" Even on Sunday

However spacious Milwaukee's Auditorium may appear when unoccupied, it was none too large to house the Milwaukee Automobile Club's show, which held the boards there from February 22 to 27. When noses were counted among the car exhibitors it showed 35 manufacturers and dealers—it largely was a manufacturers' show—who staged some 53 brands and over 150 models in all. Besides this there were a score of motorcycles and a host of accessory people, the total exhibitors amounting to about 75. Making their debut on the show circuit were several cars: The Deal, made by the Deal Motor Vehicle Co., Jonesville, Mich.; the Imperial, of Jackson, Mich.; the Wisco, born of the Wisconsin Motor Car Co., of Janesville, and the Johnson gasolene car, produced by the Johnson Service Co., of Milwaukee.

Adopting the outdoor scenic effect which has been so widely used for show settings by various managers throughout the country this season, the big hall was transformed into a garden. In the arena, aisles marked by white pillars topped with potted plants, were laid out, converging at the stage,

where a profuse bank of potted plants and flowers were massed. In the centre of the arena was an electrical fountain playing incessantly through a film of vari-colored lights and surrounded by banks of flowers and plants. Above these was suspended an aeroplane, without which no show of the current season's vintage seems complete.

No better illustration of the broad minded attitude of the authorities of the Cream City as regards the observance of the Sabbath was needed than the fact that the show was open on Sunday as well as week days and closed on Sunday night, 27th ult., with a grand finale of music and entertainment.

That all was not harmony in the ranks of the local dealers was strongly illustrated by the fact that some fourteen dealers refused to take space at the show and held private displays at their salesrooms, which were elaborately decorated during show week. Some time previous to the show these dealers issued a statement setting forth their position and their reasons for not supporting the Auditorium show. According to the fiat of the insurgent dealers, the exhibition which was promoted by the club was a pri-

vate enterprise to raise funds for the erection of a new clubhouse, and that inasmuch as they claimed that dealers were not given fair consideration in the arrangements for the show, they decided not to take part in it. This, however, was the extent of the dealers' opposition to the show, and they did nothing further towards opposing it.

Those who held private shows at their salesrooms were the following: Akin Motor Car Co., Stevens-Duryea and Columbus electrics; Curtis Automobile Co., Reo; Jonas Automobile Co., Cadillac and Peerless; Edward F. Sanger Co., Maxwell, Oldsmobile and Stearns; Waite Bros., Moline; American Automobile Co., Pierce-Arrow and Babcock electric; Emil Estberg, Pope-Hartford, Woods and Waverley electrics; Mitchell Auto Co., Mitchell; Albert Smith, Palmer-Singer; Bates Oldenbrett Automobile Co., Winton, Overland and Marion; Hickman-Lauson-Diener Co., Ford, Cartercar and R. A. C.; Rambler Garage Co., Rambler; Studebaker Automobile Co., Studebaker-Garford and electric; Welch Bros. Motor Car Co., Packard and R. & L. electric. Cars were furnished by the dealers

to transport visitors from and to the various establishments. The Auditorium exhibitors were:

Gasolene cars—Kopmeier Motor Car Co., Velie and American; West Side Auto Garage, Auburn and Halladay; Franklin Automobile Co., Franklin; Badger Motor Car Co., Badger; Stephenson Motor Car Co., Brush, Staver, Speedwell and Utility trucks; Buick Motor Co., Welch, Buick pleasure and commercial; Ogden-Farwell Garage, Chalmers and Hudson; McDuffie Automobile Co., Courier and Stoddard-Dayton; La Crosse Plow Co., Deal and Imperial; Modern Motor Co., Empire; Gove Automobile Co., Fuller and Jackson; Grout Automobile Co., Grout; Schreiber Motor Car Co., Haynes and Locomobile; Taylor Bros., Hupmobile; International Harvester Co., International; Johnson Service Co., Johnson; Kisselkar Co., Kisselkar; Knox Automobile Co., Knox; W. V. B. Camp-

bell, Lozier and Mercer; J. I. Case Plow Works, Ohio; Pierce Motor Co., Pierce-Racine; H. E. Halbert, Paterson "30"; B. F. Dorsch, Schacht; J. L. Kinz Machinery Co., Warren-Detroit; White Co., White steam and gasolene; Wisconsin Motor Car Co., Wisconsin; Abresch-Cramer Auto Truck Co., Abresch-Cramer trucks; Brodeser Motor Truck Co., Brodeser trucks; Wisconsin Motor Mfg. Co., Clark trucks; H. P. Haushalter, Haushalter trucks; Commercial Auto Co., Gramm-Logan trucks; Meiselbach Mfg. Co., Meiselbach trucks; Welch Bros. Motor Car Co., Packard trucks; Sternberg Mfg. Co., Sternberg trucks.

Electric vehicles—Franklin Automobile Co., Babcock; George F. Gerlach, Baker; Kopmeier Motor Car Co., Detroit; McDuffie Automobile Co., Ohio.

Motorcycles—Comet Motor Co., Comet; Harley-Devidson Motor Co., Harley-David-

son; Wisconsin Motorcycle Co., Indian; F. A. Bremmer, Merkel and Light; R. C. Parson, R-S; J. H. Wagner, Yale.

Accessories—Charles Abresch Co., Julius Andrae & Sons Co., Aquila Chemical Co., Bartles-Maguire Oil Co., Cream City Trimming Co., C. N. Casper & Co., Christenson Engineering Co., Detroit Steering Wheel & Wind Shield Co., Franklin Automobile Co., Garage Equipment Mfg. Co., Philip Gross Hardware Co., Goodyear Rubber Co., Leo Kopmeister Co., Kamlee Co., King Leather Tire Co., A. J. Monday, Milwaukee Trimming Co., Northwestern Storage Battery Co., The Only Grease & Oil Gun Co., O'Neil Oil & Paint Co., George F. Ransom, The Roxine Co., B. Roberts Co., Oscar L. Ritter Co., Wadhams Oil Co., Wallmann Mfg. Co., Wisconsin Motor Mfg. Co., Wisconsin Machinery & Mfg. Co., Wold Bros., Empire Fur factory, Longdin-Brugger Co., Allis-Chalmers Co.

### Four "Native" Cars Included in Baltimore's Display

With twice the number of exhibits that graced the initial function a year ago, the second annual show of the Automobile Club of Baltimore, Md., was ushered in, in the Fifth Regiment Armory on Washington's Birthday, 22d ult., amid a fanfare of horns and band music. The strides which the motor car has made in the Monument City during the past year were well illustrated by the increase in cars shown for the first time, which amounted to 28. All told, there were 241 cars on display, representing 57 different brands.

It may be surprising to some to learn that Maryland figures more prominently in the car manufacturing fields than is imagined, four native products being shown—viz., the Washington, Crawford, Spoerer and Maryland.

Myriads of Japanese parasols and lanterns dangling from the roof of the big hall and sprinkled about the galleries lent an Oriental aspect to the scene. At the entrance an arch of smilax greeted the eye of the visitor, while searchlights hidden in the greens poured forth their beams upon the

luminaries of paper and cane, which were symbolical of the Far East. Dividing the spaces were white posts topped with colored globes, and around the balconies streamers of bunting and winged wheels were tastefully arranged. Bunting was liberally used, the color scheme being pink and blue. The exhibitors were as follows:

Gasolene cars—Auto Outing Co., Haynes, Buick and Palmer-Singer; Bauman & Lilly, Washington; Boyd, Eastman & Co., Apperson; Callahan, Atkinson & Co., Locomobile; Ford Auto Co., Ford; Foss-Hughes Motor Car Co., Pierce-Arrow; General Auto Co., Parry; Griffin Garage, Knox; Hoff-Ford Co., Spoerer; Charles S. Houghten, Overland, Marion and Bobcab; International Harvester Co., International; Lambert Auto Co., Maxwell and National; E. L. Leinbach Co., Matheson; Joseph Weisenfeld, Oakland, Hupmobile and Brush; McMullen-George Auto Co., Stearns; Joseph B. McMullen, Mercer; Mt. Vernon Motor Co., Autocar; Mar-Del Mobile Co., Packard; Motor Car Co., Stevens-Duryea and Thomas; Neely & Ensor, Alco and Jackson;

Norwood Bros., Velie and Demot; Palace Motor Car Co., Klinekar and Manhattan trucks; Royal Auto Co., Rider-Lewis; F. W. Sandruck, Gaeth and Moline; Walter Scott, Crawford; Shaffer Mfg. Co., Pullman; W. P. Shuler, Mitchell; Sinclair-Scott Co., Maryland; J. J. Smith, Chadwick; Standard Motor Co., Cadillac and Oldsmobile; Shaab Auto Co., Stoddard-Dayton, Renault and Rainier; D. C. Walker Auto Co., Studebaker, E-M-F. and Flanders; White Automobile Co., White; Winton Motor Carriage Co., Winton; Zell Motor Car Co., Peerless, Chalmers and Hudson.

Steam cars—H. A. Broadbelt, Jr., Stanley; White Automobile Co., White.

Electric vehicles—D. C. Walker Auto Co., Studebaker.

Accessories—Auto Supply Co., Baltimore Buggy Top Co., E. M. Denton, James G. Davy & Co., Charles Elliott & Co., Howard A. French & Co., General Auto Co., H. W. Johns-Manville Co., Johnson & Johnson, Joseph Weisenfeld, R. Milton Norris, Frank C. Pearre, L. Sonneborn Sons, Inc., Standard Oil Co.

### American Cars Constitute Show in British Territory

Although held in foreign territory, the fourth annual automobile show of the Ontario Motor League, which was inaugurated in the St. Lawrence Arena, Toronto, Ont., on the 24th ult., is essentially an exhibition of American cars, for with few exceptions the cars displayed are of American make. Of course, considering the proximity of the American automobile centers and the fact that several American makers have established factories in Canada to avoid the duty, it is not strange that American cars predominated. Two foreign cars are shown, one from England, the other from France, and the Canadian strength is embodied in a single make—the Russell. However, this

machine is notable in that, although it is an established make, it is shown for the first time this season with the Knight slide valve engine, which has created such a furore abroad. Several other models with the regular type of mushroom valve engine also are displayed.

How great has been the expansion of the present show over previous exhibitions is shown by the number of exhibitors, 125 in all; whereas in former years it has been necessary to fill in much empty space with motorboats and kindred displays, while this year there is but one water craft shown. The large hall is tastefully decorated in red and white, while clusters of large incandes-

cent lamps hung from the roof flood the hall with light.

There are some twenty exhibitors of cars, the remainder showing motorcycles, accessories and marine fittings. The show closes today (Thursday), 3d.

The following American cars are exhibited either direct by their makers or through local agents: White, E-M-F., Cadillac, Oldsmobile, Stevens-Duryea, Welch, Haynes, Overland, Stoddard-Dayton, Ford, Reo, Oakland, Packard, McLaughlin-Buick, Pierce-Arrow, Franklin, Pennsylvania, Regal, Brush, Maxwell, Mitchell, Jackson, Metz, Pullman, Reliance, Rapid and Chase, the latter three being commercial vehicles.

## LONG STROKE AND LONG PISTON

Advanced Practice Embodied in the Excelsior Motor—Rotary Throttle on the Specially Designed Carburetter.

Modern methods of specialization permit the parts maker to keep at the very forefront of the field of design, thus placing his customer in the position of competing on an even footing with such makers as are possessed of the large equipment necessary to the production of their own components. Thus in the new four cylinder motor which has been brought out by the Excelsior Motor & Manufacturing Co., Chicago, Ill.,

RIGHT AND LEFT SIDES AND SECTION OF NEW EXCELSIOR MOTOR

it is not surprising that the long stroke idea has been carried about as far as has yet been done in automobile work, nor that the machine is equally up-to-date in other respects as well.

The cylinder dimensions are  $4\frac{1}{8}$  by  $5\frac{1}{4}$  inches, bore and stroke. By the A. L. A. M. formula, this would indicate a probable output of  $27\frac{1}{4}$  horse. But the maker's figure for the normal driving effort is 35 horsepower, when turning at 1,000 revolutions per minute, while, due to the nature of the design, extreme flexibility is claimed; the statement being made that the motor will carry its load at from 150 to 2,500 revolutions without breaking down.

In keeping with the extension of the stroke to the degree chosen, the pistons are made exceedingly long, while a noteworthy point is that the connecting rods also have been lengthened, thereby reducing wall thrusts as well as contributing to smooth working. Four eccentric packing rings are used, all of which are mounted above the wrist pins. The latter are tubular and of 1 inch diameter. The valves are interchangeable and are of  $1\frac{1}{8}$  inch diameter, with 5-16 inch lift. The valves are mounted on the left side of the engine and are operated by direct lift from the single cam shaft. This, together with the water and oil circulating pumps and the magneto drive, is actuated by spiral gears.

Lubrication is effected by means of the sump system, with forced circulation to all the crank shaft bearings and to the connecting rod bearings through ducts in the crank

shaft. The overflow keeps a constant supply in the troughs which lie beneath the cranks, whence it is caught up by scoops on the under side of the cranks and splashed against the cylinder walls and wrist pins.

Special features about the motor are the carburetter, which is of the multiple jet type with rotary throttle—especially designed for the engine; the use of a heavy support for the starting shaft, whereby the necessity of giving it an outboard bearing on the frame of the car is done away with; and the method of support. The starting shaft is held rigidly in line with the crank shaft by means of a boss cast integrally with the front cover plate of the gear housing. The engine is supported in the frame by means of an arm on either side in front,

both arms being cast integrally with the case; and a cross beam in the rear, which is bolted to the case and held under brackets cast in place for the purpose. No packing gaskets are used anywhere about the motor, ground joints being employed instead, while in the case of the water, oil and other connections, screw couplings are employed.

### How Frame Weaving Racks the Body.

Many shortcomings in body construction may be charged to the way in which cars are handled by their owners; particularly in instances where they are permitted to stand for any length of time upon uneven footing. For since the tendency to weaving in the frame has been found to be so great that in most instances designers have been forced to provide flexible connections between the essential elements of the power plant or else to combine them in a single unit mounting that itself being supported in a flexible manner, it follows that the body, which is unsupplied with such provisions, must be directly the sufferer from such stresses as result from this sort of cause. Under ordinary road conditions, it is evident that the body must be subject to considerable working. But when the car is permitted to remain for any length of time with one of its wheels considerably out of the plane of the others, it is evident that there must be some tendency for the stresses so created to be transmitted through the springs to the frame and so to cause a "permanent set" in the body.

## PROVIDES WARMTH WITHOUT FIRE

Ingenious Adaptation of a Chemical Phenomenon in a Motor Car' Heater—"Sponge" Platinum is Used.

The great difficulty hitherto experienced with foot warmers has been the necessity of using charcoal or of connecting them with the exhaust of the motor. In carriages, on the other hand, heated bricks or metal "pigs," which lost their heat rapidly, have been used, and were far from satisfactory. There has appeared in Germany, however, a novel apparatus which is based on the heat generated by certain chemical reac-

tions, and which requires practically no attention beyond the occasional charging of the fuel reservoir with small quantities of ordinary methyl alcohol, such as is readily and cheaply obtainable.

The warmer consists of a small receptacle filled with methyl alcohol, a tube leading from this receptacle to a second chamber in which platinum in finely distributed, so called "sponge" form is placed, and a small valve in the tube connecting the two receptacles, which can be regulated by hand. The vapor of methyl alcohol, when brushing over "spongy" platinum, has a peculiar quality of heating this metal to about 80 degrees Celsius (176 Fahrenheit). There is no danger of explosion, fire, or overheating, and the apparatus can be used everywhere and in every desired place, whether in the house, in the motor car, carriage, boat, etc. The platinum is practically indestructible, and the only expense is the methyl alcohol, amounting to less than 2 cents per hour. The apparatus which is constructed of bronze, and weighs less than five pounds, is marketed by the Saechsische Export Gesellschaft, Leipzig, under the name "Me Voila."

### To Operate Motor Trucks in Grand Forks.

H. W. Sims, who is engaged in the automobile business in Grand Forks, N. D., has placed an order for 10 motor trucks and will conduct a delivery service. He plans to operate the trucks on a half hour schedule to handle all freight, packages, etc., in his locality.

## BRITISH COLUMBIA COMING STRONG

**Demand for Automobiles Will be Doubled During 1910, Says a Consul—American Cars Dominate the Market.**

According to a report of Consul Abraham E. Smith, of Victoria, B. C., the number of motor vehicles now in use and registered in British Columbia is 625, of which 168 are owned and operated in Vancouver Island, and 151 in the city of Victoria. The advance of price in real estate in the three principal cities of the province—Vancouver, Victoria and Westminster—has caused a greatly increased demand for automobiles during the last few months, and dealers everywhere in the province are anxiously awaiting shipments of the cars ordered long ago, which have been delayed owing to the great floods and snowstorms of the past few weeks.

"Automobiles have become here, as in other places, no longer luxuries, but necessities," writes Consul Smith. "The insular prejudice which formerly existed against American manufacturers has measurably disappeared, as is significantly shown by the automobiles now in use in Victoria. A visit to the dealers and importers here shows that of the 151 automobiles in use in this city, one was manufactured in Belgium, two in Italy, three in France, 39 in England, 47 in Canada, and 59 in the United States. Of those manufactured in Canada, 36 bear American names and are the product of American houses, though built in Canada, their engines being made in the United States and the vehicles in Canada to save customs dues. A few runabouts are in use, but generally the car seating three or five persons is preferred."

As the roads in the more thickly settled portion of Victoria, and particularly on the island of Vancouver, are generally good, automobiles are used to a great extent for long trips to the west coast and to the mines and settlements in the northern portion of the island. Consul Smith predicts that the number of motor cars used in Victoria will be doubled during 1910.

### Even the Canaries Call for Motor Cars.

Teneriffe, Canary Islands, boasts the possession of 15 motor cars at the present time, four of which are American made, seven French and four English. At Grand Canary there are seven cars at the present time, according to American Consul Solomon Berliner, two of which were produced in the United States and five in France. In addition, three German omnibuses are in service. Improved highway conditions and increasing interest in the automobile movement has resulted in orders for four addi-

tional cars from America and two omnibuses from France. One 'bus service already is in operation in Grand Canary, and another is to be started in Teneriffe within a short time.

### Electric Horn that Affords Variable Tones.

With a diaphragm which is vibrated by means of an electro-magnet, an electric horn has been brought out by the Atwater Kent Mfg. Works, of Philadelphia, Pa., makers of the "unisparker" ignition system, which for several years has been familiar to the trade. The new horn is styled the "Monoplex," and its exterior appearance is indicated by the accompanying illustration, the brass horn, which is 11½ inches long, being mounted on a black enameled

base containing the sounding mechanism. It is attached to the dash by a bracket cast in one piece with the base, and is operated by a push button placed wherever most convenient, generally on a spoke of the steering wheel. By the turning of a screw the strength of the horn note may be altered to suit the needs or wishes of the owner. The current for the horn's operation may be supplied from dry cells, storage battery, or charging dynamo, and, if desired, from the same source that supplies the ignition. The best results are obtained on from 6 to 12 volts and the current consumption is from 1 to 1¼ amperes.

### Proper Adjustments that Save Trouble.

It is a hard matter to convince many users of automobiles that any piece of machinery, no matter how carefully made or how well designed, will, in time, wear, and this wear must be taken up. The right policy to employ in regard to connecting rods and main engine bearings is that "a stitch in time saves nine." Therefore at the first suspicion of a knock or pound, investigate the trouble and make the proper adjustments.

### Why Cylinders Should be "Bathed."

Too much stress cannot be laid on the importance of thoroughly washing out the insides of the cylinders with kerosene. The quality of oil is a factor in the amount of carbonization that takes place. There is no oil, no matter how good, but that will carbonize somewhat. The cylinders should be treated to a bath of kerosene certainly once a week, and if time permits it is advisable to flush them out twice a week, or even more frequently.

## SPAIN OFFERS OPPORTUNITIES

**Price of Gasolene a Drawback, but Hoover Declares There are Openings for Americans—How One Made Headway.**

Heretofore, owing to a number of reasons not at once apparent to the general public, Spain has not played any important part in the trade with automobiles. It has not been a great importer, neither has it been in the public eye as a manufacturing country for motor cars. A report of Consul Charles S. Hoover, of Madrid, Spain, in answer to an inquiry from the State Department, tends to shed some light upon the peculiar conditions confronting the intending importer of automobiles in the land of the Dons.

"In the Spanish capital," says the consul, "with a population equal to that of St. Louis or Boston, with the diplomatic corps, the government officials, the large numbers of people who have made fortunes in the Americas, and nearly all the nobility, there are only 725 licensed automobiles, and no automobile trucks. The reasons assigned for this relatively small use of automobiles are as follows: (1) The cost of gasolene, 48 cents a gallon, which hinders all but the rich from the use of the machines; (2) the conservatism of many influential families in clinging to horses and carriages—although this is gradually disappearing in the face of the fact that the automobile has been adopted by royalty and the leaders of the nobility; (3) the high prices which have been demanded for the machines, which preclude their use by all but the very rich—prices which would be considered exorbitant in the United States. Most of the machines in use are from 10 to 16 horsepower. As many of those are out of date their owners are anxious to sell them and purchase new machines of higher power."

It is in this desire of the early purchasers to dispose of their antiquated vehicles that the future of a good market in Spain for modern motor cars may be found.

Naturally, when the general public, particularly the middle class merchant or official, views the ramshackle contraptions masquerading under the name "Automobile" at present in the Spanish capital, it is not consumed by any overpowering desire to invest in similar machines. If, however, some good modern cars were introduced and driven continuously over the main thoroughfares of the city, there is every reason to believe that a demand for similar excellent vehicles would be created.

Consul Hoover, in discussing the conditions prevalent in Spanish cities, says that the streets in the city of Madrid are smooth and broad, and that large extensions are made to its system of boulevards. "The roads in the vicinity of Madrid, and in many other parts of the country," he

adds, "are fully as good as the famous French roads, and motoring excursions are becoming the fashion. But manufacturers who wish to compete for this market must have their own representatives on the ground to look after their interests. All the dealers are bound up by contracts so that they cannot handle American goods; in fact, nearly all the dealers are employees of the manufacturing concerns, who are merely in charge of the sales rooms established by the companies. American manufacturers have been writing to these people for some years past, with the net result that there is not an American car in use in Madrid."

On the other hand, and as an example of what may be accomplished by proper methods and personal effort, Consul Hoover relates the experience of a representative of an American automobile concern who recently visited Madrid.

"He canvassed all the dealers in the city trying to secure an agent for his car," says Mr. Smith, "but found them either unwilling or unable to accept the agency. Through a proper medium he was eventually placed in communication with a party not in business at all, who accepted the agency, purchased a car immediately, and contracted for twenty more to be delivered within the year. The car put out by this company will sell for about \$1,800 to the local trade, including the body. Its motor is 30 horsepower.

The consul calls further attention to the fact that no sales can be made from catalogs, that American factories must deal through independent representatives who will be loyal to their interests instead of using their agencies to prevent the sales of American cars.

"To sell cars to the trade here it will be necessary to show the prospective purchaser the car and tell him exactly what it will cost him laid down in Madrid. European manufacturers do this and they will continue to get all the trade until American manufacturers meet conditions as they exist here. Unattached agents may be secured, but it would be better for each company to exploit its own output through a competent salesman who can speak the Spanish language. The companies here advertise very little, and it is believed that a campaign of advertising of any car would produce good results, especially if there were a salesroom where the car could be shown to people while they were interested."

When an American manufacturer decides to invade the Spanish market, he must remember that in Spain as well as in many other European countries, the chassis only is furnished by the manufacturer, the body usually being made to order elsewhere. This division of work on one car precludes a lump sum being fixed for each car; for the price of the body will naturally depend on

the taste and requirements of the purchaser, but the consul furnishes a guiding list showing the prices of chassis put out by a well-known European factory, laid down in Madrid: 12-15 horsepower motor, \$1,785; 15-25 horsepower, \$2,200; 25-35 horsepower, \$2,291; 40-50 horsepower, \$3,667; 40-50 horsepower, six cylinder, \$4,053; 75 horsepower, six cylinder, \$5,404.

#### Body Built for Carrying Tires.

Instead of wrapping tires in yards of burlap and paper and then having a boy roll them like a hoop along the streets to deliver them to the purchasers, a firm of dealers in San Francisco, Cal., The Weinstock Nichols Co., has evolved a motor car delivery scheme which is rich in suggestion

for other large dealers who are endeavoring to solve the tire delivery problem. A light runabout has been equipped with a big hollow drum in the rear, as shown in the accompanying illustration, and in this the tires may be carried any distance and over any kind of roads without the slightest danger of chafing and without the necessity of wrapping or packing them, as has been proved in the strenuous service of the runabout in delivering Morgan & Wright tires to retail purchasers and agents.

#### Sager Still Strong for Comfort.

With a view to permitting the springs of the car a free movement in the middle range but presenting an increasing resistance to their deflection either up or down when they exceed the normal, the J. H. Sager Co., of Rochester, N. Y., is putting on the market the Peerless shock absorber, which differs from most devices of this character in that friction plates or surfaces are not an essential feature of the construction. The fork from the frame fastening is attached to a three point cam, while the lower arm, which is connected with the axle, incorporates a cover and casing holding a triangle of springs. The movement of the car frame in relation to the axle turns the cam resting within the triangle, and the greater the movement the more resistance the cam encounters, according to the degree that the springs in the shock absorber

are deflected. A price of \$50 per set of four or \$25 per pair has been set on the devices.

Detail improvements have been made also in the Sager bumper, made by the same company. The bumper stands about six inches above the spring hangers, protecting not only the lamps and the radiator, but also the fenders and tires. The bumper bar itself is a steel tube, covered with a heavy brass tube and containing a wood filler. The bell cranks are made of manganese bronze and the whole construction is designed to be "non-rustable." The I-stud bolts carrying the coil springs are fitted with nuts which permit a variation in the adjustment of the degree of spring tension on the bumper.

#### Old Trick Leads to the Law.

One of the old tricks of a small part of the trade, that of renting out an automobile placed for sale in a garage, has landed E. R. Kent and Carrie Kent, of Denver, Col., in the District Court, Judge Whitford presiding. Clarence Cobb, also of Denver, alleged that he placed an automobile worth \$1,700 in the hands of the Kents on April 16th, 1908, to be sold on commission. They rented it, he claims, until May 19, 1908, thereby damaging the property to the amount of \$1,200. The case was argued at considerable length, Judge Whitford reserving his decision.

#### How Spain Levies on Motor Cars.

The Spanish tariff on motor cars is very high; on chassis alone it amounts to 7 cents per pound. Cars with open bodies pay besides the chassis duty an extra \$38.60 for the body; cars with closed bodies must pay \$61.76 plus the rate for the chassis. In case the machine is imported complete, the weight of the chassis is determined by the Spanish authorities by subtracting 440 pounds from the gross weight of open cars, or 880 pounds from that of closed cars.

#### Mexico Leans to European Cars.

Despite its neighborly advantages, the automobile market of Mexico continues to exhibit a decided leaning toward the European made product. According to American Consul William W. Canada, of Veracruz, a total of 74 automobiles was received at that port during the latter half of 1909, destined for the interior. Of this number one came from England, 66 from the Continent, and only seven from the United States.

#### How Horse-Drawn Trade is Affected.

As a manufacturer of both automobiles and horse drawn vehicles, John M. Studebaker, head of the big company in South Bend, Ind., which bears his name, has made a commentary on the effect of the motor car industry on the carriage trade.

"The automobile has practically killed the business in fine horse drawn vehicles," he declares, "but it has increased the output of the medium class vehicle."

## HAS A SLIDE VALVE IN THE HEAD

Radical System Employed in the Drummond-Bostock Engine—Advantages Obtained by the Construction.

Slide valve engines in one form or another continue to multiply in Great Britain at a rate which threatens the ultimate extermination of the poppet valve type—or at least would do so were it not for the fact that up to this time most of the inventions of this character still are confined to blue print paper. Several practical designs have been committed to cold metal, however, and with encouraging results to those who are enthused with the principle. One such is the Drummond-Bostock, which is the invention of two engineers in the employ of the English Lorraine-Dietrich Co., and has been in operation on the road since last June. So successful has it proved that manufacturing arrangements between the inventors and the Dietrich company are said to be in prospect.

Despite the radical character of the slide valve principle as applied to internal combustion engine construction it must be admitted that the Drummond-Bostock design is one of the most promising of the great number of new inventions along this line which have come to light during recent months. Its construction, in a word, provides for a single ported sleeve valve mounted in a cylindrical chest over the combustion chamber, the sole purpose of which is alternately to close the cylinder and to open it to communication with the interior of the sleeve. Within the latter a second valve member is mounted which alternately opens communication with one end or the other of the cylindrical space. According to the position of the second valve, the cylinder proper is put into communication with the inlet or exhaust:

As will be seen from the illustration, the general formation of the engine is little different from that of the ordinary engine, save that the cylinders are cast without pockets, but with the peculiarly shaped head formation which is necessary to the operation of the system. In the motors thus far produced the valve gear, which consists of a single crank mounted along side the cylinder heads, is driven by chain and sprocket mechanism.

The construction is such that despite the use of two valves, only one is required to be a gas-tight fit with the cylinder. This is the outer sleeve B, which is designed to open the cylinder during the exhaust and the succeeding intake strokes. During the two strokes remaining in the cycle the cylinder is closed, only the blind face of the valve being presented to the interior of the combustion chamber. On this account practically two revolutions are consumed in making each stroke.

The inner valve, which acts as a distributor only, also runs at half piston speed. Its action is merely that of a simple piston, as it alternately closes the distributing chamber first in one direction and then in the other. As shown at A, it is in mid-stroke position. As this part of the system is not exposed to high pressures, it does not require to be more than a good running fit, while its travel being slight, and its motion unincumbered by high pressures, very little power is required to drive it.

It will be observed that the valve chest or cylinder forms practically a straightaway passage from the intake manifold D and

the exhaust main E. The piston A therefore acts as a deflector and automatically selects the proper avenue of communication according to the period of the cycle.

Another important element in the design is the stationary cylindrical sleeve, C. This provides at once an interior guide for the main valve B, and also a seat for the distributor A. Also it assists materially in packing the main valve member. A junk ring closes the pocket on the right hand side of the motor and therefore on the exhaust side, while the valve is equipped with a single set of rings on its left hand end, to prevent leakage of the cylinder gases in that direction.

Cooling of the valve surfaces is secured in part through the water jacketing of the cylinder, and in part as a result of the cooling influence of the incoming charges, which leave the interiors of both valves during the suction strokes. Needless to say, the valve construction is almost completely balanced. This means that the parts work silently and without shock, and that very little power is required to drive them. As a matter of fact, on the first engine tried out in a practical way, the valve gear was driven by only a half-inch roller chain, and this was found to be adequate for the work it was called upon to perform. Unfortunately no data as to the performance of this as compared with other engines of corresponding cylinder dimensions are as yet obtainable.

## PROSPECTIVE CHANGES IN DESIGN

Points that Manufacturers Must Consider Before Making Alterations in Models—The Course of Improvement.

Show time, with its influx of new developments invariably gives rise to some question as to the reasons impelling certain manufacturers to introduce a large number of improvements in their lines, while others bring out few improvements, if indeed, any at all. Superficially, questions as to the advisability of making changes in the design of a product might appear to be governed solely by considerations of relative serviceability, restricted to some extent by demand. Actually, the manufacturer who is in a position to command certain alterations finds himself obliged to weigh with extreme delicacy a large number of conditions more or less conflicting in their nature, and is able to arrive at a definite conclusion only after mature deliberation. Some of the considerations involved are analyzed by a foreign authority who gives expression to a great deal which is in the mind of every manufacturer, whatever his product may be, when considering upon improvements.

"The difficulty which the manufacturer labors under when endeavoring to arrive at a decision as to whether he shall adopt some new device or adhere to his last year's design is not alone the uncertain factor of the practical working of the device under the conditions of public use, but—and this is quite as important—it may be questionable how the new device will appeal to the public taste," he observes. "And here it may be remarked that the automobile engineer has to face a problem which perhaps has no parallel among the other branches of engineering; he must be sure that any appliance he introduces will appeal to a somewhat unmechanical public, or in any case to a body of buyers who are not trained engineers. In other branches of engineering, in most cases the purchaser is himself an engineer, or is in a position to receive the opinion of a trained engineer before effecting a purchase . . .

"Then again some few people hold the opinion that whenever a manufacturer alters to any great extent an important part of his chassis, he may be considered to have admitted error of design of that particular part on the previous year's chassis. This may have the effect of causing some amount of loss of faith in the manufacturer on the part of the public. The loss of faith may not be merited, however, as there are several reasons which may cause a manufacturer to change his designs. He may change, as before suggested, principally to engage public attention; he may change in order to introduce some innovation which was not even in existence at the time of last exhibiting; it may be essential for him to

change in order to meet some new public requirement—such as, for example, a demand for a more roomy body; and, finally, he may change in order to reduce cost of manufacture in some way.

"It may be remarked that the large amount of extra expense entailed in getting out a new design, such as cost of the designs themselves, of new patterns, of new jigs and tools, and perhaps a considerable amount of reorganization in the works generally, is a sufficient guarantee to the public that the innovation is worthy of their most serious consideration. I am inclined to think that the public are prone to expect too much of a new device—for example, a new engine—and they are not aware of the extreme difficulties to be encountered before even a small genuine advance can be made in matters engineering. For a manufacturer to secure the patent rights of any device which can claim to be really very much in advance of other devices of a similar nature is, in these days of keen competition, almost an impossibility. The more successful devices on the market may, perhaps, be superior mechanically to their rivals by some five per cent., if one may be permitted to describe their superiority in this way. Good workmanship and good management are responsible for the greater part of their success."

It is pertinent in this connection to note the observations of another authority, a British engineer, on the visible improvements which are being wrought out in the English branch of the industry just at the present time.

"The most striking feature of the latest productions," in his estimation, "is the better balance given to the chassis." He adds:

"Formerly no attention was given to the disposition of weight, with the result that unequal loads were imposed upon the springs, and on bad surfaces excessive rolling of the frame was set up. The best practice is to trace an imaginary fore and aft center line through the chassis and dispose the weights equally on either side, keeping the greatest weights actually on this center line.

"Spring design has not varied greatly, but length and width have both been increased. Three-quarter and full elliptics vie for popular favor. The transverse front cross spring which once seemed likely to gain in popularity now appears on few cars, the Sizaire et Naudin being perhaps the best known example, and even the original arrangement is not followed. But the usual types are not likely to be displaced by any other kind of steel spring, and if it ever is superseded, it will in all probability be by some arrangement such as the Cowey pneumatic suspension.

"The use of the springs to take the driving thrust and torque of the live axle is not an advance, although it may be excused where cheapness and simplicity are the first considerations. With stout shackles and large bearing surfaces well lubricated no

undue wear may result, but the fact still remains that the springing designed to take these strains will not be best for efficient suspension.

"Steering gear continues to improve. The old ball and socket joint has given way to stirrups, or where retained is of the horizontal, and not vertical, type. Swivel centers are now mostly designed to bring the axis produced to a point where the tire touches the ground, but such arrangements have their drawbacks, such as the wheel lifting when turned, but no maker seems to have the courage to tackle the wheel with the swivel center in the hub. It can be done, and one day will be done, for there is nothing to prevent it. The wheel may be a little heavier and the bigger hub may look strange at first, but we do not notice changes in appearance as much as we used, and the perfect steering with absence of strain on wheels and tires will give more than adequate compensation. The stub axle is not really good engineering, and it is upon this that I base my opinion that it must go sooner or later. Another direction of advance is in providing easy adjustment for backlash in the steering. Whilst an absolutely tight wheel is not necessary, or, indeed, desired, by many good drivers, yet beyond a certain degree lost motion in the steering becomes dangerous, owing to time lost and want of surety. Therefore the provision of complete worm wheels which can be rotated when worn and another point used, double nuts, etc., is to be recommended, and any car without adjustment for worm and wheel or nut will soon be out of date, and rightly so.

"As regards general chassis design, it is probable that the development of the unit system will become very popular. The old unit with crank case, fly wheel casing, and gear box all sealed up together had not much to recommend it, but the present practice of using one casting for engine and gear box bases or two or more bolted together, with the fly wheel and clutch gear uncovered, is excellent. The future will probably bring forward a pressed steel design of crank case and gear box in one, whereby machining and handling will be simplified. It is not likely that these details will be pressed out with the frame, for the advantages of the scientific unit are that it can be supported at three points, thereby ensuring immunity from any distortion of the main frame.

"In gear boxes the chief advance is in using helically cut pinions for the constant mesh wheels, and it is only the impossibility of engaging wheels of this type which prevents them being used throughout. On many cars every fixed gear is helically cut, but it is doubtful whether the complication of a constant mesh gear box and locking device would give sufficient return for replacing the existing cut pinions by helical gearing.

"One of the most significant features of the 1910 cars is the increase of the worm

drive, and I should not be at all surprised if in five years the bevel drive has not been relegated to the position now occupied by chains. Formerly considered most suitable for heavy work, the worm drive is now to be found on low powered cars also, and as experience of it increases so will its popularity, for there is no question of its silence and efficiency. Whether the drive should be to the top or bottom of the worm wheel seems undecided, for we see the same firm employing either method on different models. At the bottom it may have more efficient lubrication, but unless a very low setting is given to the engine and gear box a somewhat sharply inclined shaft is necessary, although the engine can be inclined slightly to overcome this. The drive on top is apt to mean a chassis with the weight high, so that altogether the worm at the bottom is probably the best if the mechanism can be kept low enough. . . .

At one time it was common to see torque, radius and brake rods and cardan shaft all jointed at different centers—a bad feature now fast disappearing. The enclosed shaft with forked or ball-ended front end seems to be likely to become the most popular. It gives the utmost freedom to the axle while relieving it of all strains, but driving. The only objection is that the driving thrust comes on the center of the axle, whereas side radius rods divide the thrust and impose the loads as near as possible to their points of application.

"In conclusion, it is obvious that we are far from finality at the present time. . . . The tendency is undoubtedly towards refinements which make for efficiency, and when side by side we see the development of the cheap car on the lines of reducing working and assembling costs, and not by low grade material and work, it is evident that the industry is in a healthy and virile state."

#### Ice in the Acetylene Generator.

Although the water in acetylene gas generators is liable to freeze during cold weather, so long as the container is made of proper strength there is small danger of its being injured and little likelihood of inconvenience resulting therefrom. The addition of a small amount of water to a frozen generator—in emergencies a little saliva will do—is sufficient to start the generator working, when the heat of the chemical action will be sufficient to thaw out the main supply and permit the action to go on in the usual way.

#### Britishers May Show at Paris.

In connection with the forthcoming Paris Salon, to be held next winter, the project of promoting a collective automobile exhibit is being discussed in British trade circles. Representation secured on such a co-operative basis as this is already being applied in preparation for the Brussels international exposition, which will open this coming summer.

**T**HE new Rambler, because of its quiet ease of motion, reserve power, and dignity of comfort, affords to the busy man pleasing relaxation and healthful recreation with family or friends at the end of the day. For satisfactory operation in crowded city traffic, on boulevard, or country road the new Rambler, because of the offset crank-shaft, is capable of three or sixty miles an hour, on high speed, climbing any hill with gratifying ease. The Spare Wheel obviates tire trouble. With straight-line drive, big wheels and tires, and new expanding clutch the new Rambler is superior to all in efficiency and better than any in quality, silence, and comfort.

Rambler automobiles, \$1,800 to \$2,500

## ACID BALL BEARINGS' WORST ENEMY

**So Declares Matt in a Lecture on the Subject—Some Other Interesting Facts Brought Out.**

Despite the frequent and rapidly increasing use of ball bearings in automobile construction it is noteworthy that a number of popular misconceptions as to the true nature and operating requirements of such mountings exist. Due in part to the term anti-friction which commonly is applied to them, it has come about that the average layman regards them as not only frictionless, but entirely divorced from the necessity of such attentions as are deemed requisite to the proper service of bearings of the plain type. A number of these erroneous impressions are dissolved by W. L. Matt, of the Hess-Bright Mfg. Co., who lectured upon the subject last week before the New York School of Automobile Engineers. He said in part:

"Automobiles are so generally mounted on ball bearings both in this country and abroad that this practice may well be considered as standard. In spite of this almost universal use, we have constant evidence that many important facts about ball bearings and their care are not appreciated by the using public.

"Bearings are, broadly speaking, of two general types—radial bearings that carry the load at right angles to the shaft, and thrust bearings carrying loads parallel to the shaft. The first of these consists of an inner and outer raceway, between which a series of balls roll in grooves. These grooves guide the balls in their correct path and give additional strength over that which would obtain with a flat running service. This is the type of bearing largely used on automobiles. While this bearing is designed to carry only radial load, it will carry a reasonable amount of endwise loading, and is especially desirable for this at high speeds.

"The number of balls that can be gotten into these grooves is limited to about half of the total circumference, unless it is desired to cut a so-called filling slot, as is sometimes done. In such a case the continuity of the running surface for the balls is broken and the advantage of more balls is more than lost by the weakened race construction. The end thrust bearing consists of two plates in between which the balls roll; one of these is fastened to the end of the shaft and the other seated in the housing. Of course, a full circle of balls can be used in this type of bearing. This is the type of bearing frequently used behind the bevel gear to carry the severe load due to driving thrust.

"An impression that ball bearings will successfully operate without lubricant is more general than one would think. This is absolutely untrue. There is a slight amount

of sliding friction in the best of all ball bearings due to the fact that the materials are, after all, elastic, and there is of necessity some deformation under load. In addition, there are small inaccuracies of workmanship that make for more or less sliding. HB-DWF bearings are made to shop limits of a few ten-thousandths of an inch, but even that is a deviation from the essentials of theoretically pure rolling. Therefore, it is apparent that lubrication must be furnished. Besides its function of reducing friction, it acts as a protection against rust and against the entrance of grit and foreign matter which causes wear. Every ball bearing housing on an automobile should be kept well filled with grease or oil. The hubs in particular should be filled by repeatedly screwing on the hub cap full of good grease until the grease is forced out from around the rear closure.

"Acid is the enemy of the fine surface finish of a good ball bearing. Therefore one must be certain that the grease contains no acid. A simple test for this is to place a thin film of it upon a highly polished piece of steel and allow it to lay exposed for several days. Any discoloration or evidence of pitting should be sufficient to bar the use of such grease. If this careful attention is given whenever there is a ball bearing it will be found to pay for itself in the extended life of the bearing.

"The use of ball bearings is as wide as the machinery world. Wherever there is a rotating journal of any sort, there a ball bearing may be profitably used. Small spindles of but a fraction of a pound and immense turbines of a hundred tons are today running on HB-DWF bearings; and this from a speed of a few revolutions per minute to many thousands per minute."

### Unusual Cause of Over-Lubrication.

Commonly it is supposed that automatic, constant flow lubrication when properly regulated, is calculated to overcome any tendency to smoking at the exhaust which, in the older splash system results from irregular and frequently overabundant supply. In the case of the system in which the oil is forced through ducts in the crank shaft, in particular, it is supposed that except where the regulating device is badly out of order there should be no tendency to over-feeding. That such is not necessarily the case has been proved in more instances than one, somewhat to the mystification of operators and repairmen. In one instance, at least, the difficulty was located in an unexpected point when the "big end" bearings of the connecting rods were taken up after having developed an inordinate amount of play. It was found that as a result of the undue lost motion, the effective area of the delivery openings at the connecting rod bearings was increased. Consequently, although the pressure in the system was in no way affected, larger quantities of oil were delivered, with the result that the engine began to give unmistakable signs of over-lubrication.

## CAUSES NINE-TENTHS OF TROUBLE

**Maxwell Summarizes the Several Things that are Responsible—Most of Them are Small Ones.**

Asked what in his judgment would safeguard the upkeep expense attending the running of an automobile, J. D. Maxwell, vice-president of the Maxwell-Briscoe Motor Co., offered the following "make sures" against the usual "guesses" of the motorist:

That there is plenty of oil in the lubricator, that it is feeding properly and that the oil is the best obtainable. A little oil in the right place at the right time, will forestall a big repair bill.

That all bearings are properly adjusted. One loose bearing has a tendency to loosen others, causing knocks, loss of power and crystallization of metal. More harm can be done to a motor by running it on loose bearings for a few days than would result from a year's ordinary use.

That cylinders, pistons and valves are not coated with carbon. Kerosene oil will not remove it, once it is baked on, without the assistance of a scraper.

That steering connections are cleaned and oiled. This will prevent the excessive wear and play so common in steering gears.

That front wheels are properly adjusted. It will save tires and cones.

That rear axle and drive pinion bearing are always well oiled, and that your universal joints are never allowed to become dry.

That all bolts and nuts are kept tight. Ten minutes use of a wrench each week will prevent many a break.

That the motor is kept clean. Better results will be obtained from a machine, and better work from any repair man, who is obliged to work on it. A dirty motor is a sure sign of neglect.

"My experience has taught me," added Mr. Maxwell, "that neglect of these details is responsible for nine-tenths of the repairs necessary on an automobile. Aside from the repairs, attention to these matters will save many dollars in depreciation of the car, and assure the owner of his full quota of pleasure."

### To Get at Cost of Commercials.

With the object of obtaining authentic information as to the costs of commercial vehicle operation, the Commercial Vehicle Users Association, of Great Britain, is considering a plan to offer cash prizes for the most satisfactory practical working results. It is proposed to offer a substantial reward for the best economy obtained with a single light delivery vehicle of less than one-ton capacity; the competition incidentally being expected to develop a considerable amount of information which will be of value from an educational standpoint.

# **"This Advertisement is Published for the Protection of Automobile Buyers"**

By the

*Ford Motor Company*

DETROIT, U. S. A.

An advertisement recently published under this heading was for the intention of intimidating prospective buyers, who, deciding on merits only, would overlook all of the "71" varieties mentioned and purchase a FORD.

**History repeats itself.** That same sort of advertising appeared in 1903, warning against the purchase of an Unlicensed Car. After nearly seven years the Licensed Association has unexpectedly received a *Lower Court* decision and the advertising of 1903 is repeated.

**They tell you in bold face type** that "There is no reason why anyone buying a car should not buy a Licensed Car." There are many reasons why anyone should *NOT* buy a car licensed under the Selden Patent, because by so doing trust methods are encouraged, the evolution of the industry curtailed, and the maintenance of high-priced and poor quality cars assisted, because it is obvious that a protected monopoly does not try to please the public by producing better goods by more economical means.

**Who has constituted this "Divine Body"** to tell the public the names of manufacturers who market honest or dishonest cars? Who will say that FORD cars are dishonest after all they have done to promote the advancement of the industry? In this connection we were speaking to one of the prominent Licensed members the other day, and during the conversation he stated that without doubt HENRY FORD had done more, in building and marketing his low priced machines, to advance the industry than any dozen other manufacturers in the business.

**It is a safe bet** that the car will be honest as long as the manufacturer pays his dues to this "Divine Body." And would this same body deign to pronounce the FORD car dishonest in the face of what it has done for the development of the entire car industry? Would the FORD be a dishonest car if FORD would join the "71" varieties?

**Our opinion and our position, taken from the beginning, is unshaken**—that this Selden Patent is a *freak among alleged inventions and is worthless as a patent and worthless as a device.*

**The advertising campaign** in the newspapers of this "Divine Committee" represents commercial morals and business methods which are very questionable. If the Ford Motor Company cared to resort to such tactics it has patents that cover many of the leading features of automobile construction a thousand times more valuable in the automobile industry than Selden's, and could also threaten and bring suits against many of this "Divine Committee" as infringers of its patents. Not for a moment, however, had it entered our heads to harass or annoy individual users of Licensed product by suing them as infringers of Ford patents.

**Although the opinion of Judge Hough** was filed on September 15, 1909, no decree has been entered. It would really seem, then, that this threatening cabal should get through with us first before they make any attack upon our customers. The court will not permit our customers to be sued and persecuted as individuals while this suit is pending against us as manufacturers.

**A Lower Court Decision** is far from final. It is only the first round of a patent battle. There remain the Court of Appeals and then the Supreme Court, to both of which we can, and, if necessary, will, carry the case. This is a right granted us by the Constitution of the United States, which right we will exercise, so that it is hardly becoming of our esteemed Licensed competitors to take this decision as final and by it endeavor to intimidate present and prospective owners of Ford cars.

**The opinion of the patent in the lower court** was rendered by District Judge Hough, showing on its face that he expected an immediate appeal to the higher court from the doubtful questions disclosed by his opinion.

**Although it is seven years** since this fight was started and nearly six months since the decision was rendered, no decree has yet been entered, and there is no immediate likelihood.

**There are millions of dollars** invested and more being invested every day in the building and marketing of Unlicensed automobiles which will unquestionably bring advanced methods of manufacture into vogue and will mean better and more economical cars to buy and maintain.

**It is a well known fact** that prices are already too high, although this "Divine Executive Committee" says to the Unlicensed makers, "Before we will place upon you our 'Divine' blessing we desire you to advance your prices several hundred dollars per car and to limit your production," and while they do not say, it is clearly implied, "so we will not have such keen competition."

**Because the unlicensed makers** are not organized they do not present such an array of names as their self-constituted saviors of the public, but we assure you that there are sufficient independent manufacturers who will continue to fight against turning the automobile industry into a monopoly.

**It is clearly the duty** of every law-abiding American citizen to respect exclusive rights secured by a patent, when that patent has been honestly obtained, honestly operated and declared to be an honest patent by the highest courts in the land. Such, however, cannot be said of the Selden patent.

**We take issue** with the statement that the members of the Licensed Association individually and collectively are chiefly responsible for the development of the automobile to its present perfect state. HENRY FORD alone has done more to develop the automobile industry than the combined members of the Licensed Association, which fact cannot be honestly contradicted. We believe the public will agree with us in this.

**It is not true** that those Licensed under the Selden patent have been and are now leaders in the production of medium, low and high priced cars. We can prove by figures and facts, that HENRY FORD produces more low priced cars than any other maker in the world. So it can hardly be stated that these Licensees are the leaders in the production of low priced cars. We ask our friends who have heard or read some of the statements made by these "Divine" people to call upon them to furnish their proof.

**In conclusion we beg to state** if there are any prospective automobile buyers who are at all intimidated by the claims made by our adversaries that we will give them, in addition to the protection of the Ford Motor Company, an individual bond issued by the National Surety Company of New York whose assets, combined with those of the Ford Motor Company, aggregate approximately \$12,000,000.00, so that each and every individual owner of a Ford car will be protected until at least \$12,000,000.00 of assets have been wiped out by those who desire to control and monopolize this wonderful industry.

**The bond is yours for the asking,** so do not allow yourself to be sold inferior cars at extravagant prices because of any statement made by this "Divine" body.

**N. B.—**This fight is not being waged by the Ford Motor Company without the advice and counsel of the ablest patent attorneys of the East and West.

**This announcement is made so that buyers of Automobiles may know the facts and be governed accordingly.**

## RECENT PATENTS.

942,328. Igniter for Internal Combustion Motors. Howard A. Johnston, Toronto, Ontario, Canada. Filed Sept. 27, 1907. Serial No. 394,869.

1. An igniter for internal combustion motors comprising a sparking plug provided with suitable electrodes, one electrode being shaped to form a cup, and the other shaped as a wire extending from without the cup within sparking distance of the rim of the cup.

942,467. Starting Device for Internal Combustion Motors. Eliel L. Sharpneck, Boston, Mass. Filed Feb. 6, 1909. Serial No. 476,579.

1. The combination with an internal combustion motor having an exhaust furnished with two outlets, of a valve movably mounted in said exhaust, for controlling the flow of fluid therethrough, and a second valve actuated by the opening movement of said first mentioned valve to close one of said outlets.

942,567. Automobile Tire. Iva B. Kempshall, Boston, Mass. Filed Aug. 13, 1909. Serial No. 512,700.

1. An anti-skidding tire for automobiles provided with a rubber surface, formed along the tread with a series of continuous edges extending around the tire, and is formed with a series of pockets.

943,671. Hanger for Shock Absorbers. Ernst Flentje, Cambridge, Mass. Filed Sept. 27, 1909. Serial No. 519,776.

1. In a shock absorber, the combination with a cylinder and a piston therein, of a clip adapted to be secured to the axle of a car, a member having a stem swiveled to said clip and provided with a laterally extending foot which is connected to the cylinder, a bracket secured to the frame of the car, and another hanger device provided with a stem which is swiveled to the bracket and provided with an overhanging portion that is connected to the piston rod.

943,689. Radiator. Samuel Lavine, Detroit, Mich. Filed July 6, 1909. Serial No. 506,248.

1. A radiator comprising tubes of cruciform in cross section arranged in rows with the laterally projecting portions of the tubes of one row projecting into the spaces between the laterally projecting portions of the tubes of the adjacent rows with spaces between the rows forming tortuous passages.

943,697. Magneto Electric Machine. Theodor M. Mueller, Dalton, Mass. Filed Feb. 25, 1909. Serial No. 480,038.

1. A magneto electric machine having in combination with the permanent field magnets thereof, a rotatable inductor element, an adjustable, but normally stationary element, located between the field magnets and the inductor element for varying the magnetic flux through the inductor element, an induction coil, the core of the same being included in the magnetic circuit, and means carried by the inductor element for making and breaking the primary circuit.

943,744. Automobile Driving Mechanism. Charles B. Hatfield, Jr., Oshkosh, Wis. Filed Aug. 3, 1908. Serial No. 446,698.

1. In driving mechanism for a self-propelled vehicle, the combination, with the driving road wheels of such vehicle, of an axle on which such wheels are mounted to rotate reversely arranged ratchets mounted to rotate and correspondingly reversed

pawls operatively connected to said wheels on their inner faces, means for driving said ratchets, and means for shifting said ratchets to engage one or the other set of pawls; substantially as described.

943,745. Automobile Driving Mechanism. Charles B. Hatfield, Jr., Oshkosh, Wis. Filed Aug. 3, 1908. Serial No. 446,699.

1. In a driving mechanism for a self-propelled vehicle, the combination, with the driving road wheels of such a vehicle, of a live axle on which the wheels are mounted to rotate, a ratchet carrier at each end of the axle and secured directly thereto, a pair of reversely acting ratchets secured to each carrier, pawls for said ratchets, a pawl carrier or support secured to each vehicle wheel, and means for shifting the ratchet carrier longitudinally on the axle for disconnecting one set of ratchets and pawls and connecting another set thereof at each end of the axle; said ratchets and pawls performing both driving and differential functions; substantially as described.

943,746. Automobile Driving Mechanism. Charles B. Hatfield, Jr., Oshkosh, Wis. Filed Aug. 3, 1908. Serial No. 446,700.

1. In a driving mechanism for a self-propelled vehicle, the combination, with the driving road wheels of such a vehicle, of a divided live axle connected to such wheels, ratchet carriers arranged at the proximate ends of the members of such axle and mounted to rotate with but move longitudinally thereof, a pawl support adapted to be driven by a prime mover, sets of pawls thereon, ratchets mounted on said carriers and having reversed ratchet teeth, said ratchets being adapted to co-operate with said pawls, and means for disconnecting one set of ratchets and pawls and connecting another set thereof; substantially as described.

943,764. Spring Running Gear for Automobiles. Clarence P. Boomer, Muncie, Ind. Filed Jan. 2, 1909. Serial No. 470,455.

1. The combination with a pair of axles provided with double bowed springs, of a bolster mounted on the springs of one of the axles, an arched bar pivotally mounted on the springs of the other axle, an arched bar pivotally connected to said arched bar, and a frame mounted on the last mentioned arched bar and the bolster.

943,774. Shock Absorber for Automobiles and the Like. Robert B. Ewart, New York, N. Y., assignor of one-half to Benjamin A. Seitz, Kansas City, Mo. Filed March 10, 1909. Serial No. 482,439.

1. A shock absorber comprising a fluid containing casing having main and auxiliary compartments, connected reciprocatory elements in the respective compartments, means for permitting displacement of the fluid from one compartment to the other, means for permitting displacement of the fluid from one end to the other of the main compartment, and separate fluid-controlling devices carried by said means.

944,213. Tire Pump Attachment. Harry H. Rung, Philadelphia, Pa., assignor of one-half to Robert F. Whitmer, Philadelphia, Pa. Filed Sept. 7, 1907. Serial No. 391,826.

1. The combination with a traction wheel of an automobile, of a crank arm detachably connected to the same, a pump cylinder detachably hinged to the automobile, a piston in said cylinder connected to said crank arm, and a hose leading from said pump to the tire of a wheel whereby said tire may be inflated by driving the wheel to which the crank arm is attached.

**You, as a dealer, have reason to get this book—which costs you nothing but which shows you how to buy accessories to your best advantage and biggest profit.**

Making money on accessories is easy when you get the right prices, the right goods and prompt deliveries, together with right treatment and actual selling assistance.

You will understand why so many dealers all over this country find profit and satisfaction in having us supply their accessories, when you get our big 1910 catalog and CONFIDENTIAL net trade price book.

So successful have the dealers been who handle Post & Lester goods that we have grown to be one of the largest wholesale accessory houses in the world;—but that means nothing to you until you use our immense capacity and resources for your own benefit.

To protect legitimate dealers, we must ask that you send us proof that you are in the trade when you send for the big 1910 catalog and CONFIDENTIAL net price book. Your letterhead or business card will probably be sufficient.

Tell us what kind of a business you are doing or are expecting to do this year, and we will write you giving you special information concerning some things that may be of particular value to you in your territory. Please direct your letter to GENERAL SALES MANAGER.

939,972. Front Wheel Drive for Traction Vehicles. Lewis K. Brown, Tsotin, Wash. Filed Sept. 8, 1908. Serial No. 452,156.

1. With an axle casing and housing inclosing a centrally disposed differential gear and inclosed driving sprocket wheel, having live axle pieces rotatably located within the casing and connected at their inner ends with a differential gear, the combination of coaxial perpendicular hinges on the axle casing between the central housing and the wheels, near each end of the casing and a short distance from each of the wheels, a bell crank fastened on the back of each of the laterally swingable portions of the axle casing and extending rearwardly therefrom, a universal joint in the live axle intersected by the axis of the vertical hinge on the axle casing, a laterally swingable portion of the live axle connected with the universal joint and journaled in the laterally swingable portion of the axle casing and protruding outwardly through the end of the swingable portion of the axle casing, a wheel hub with an outwardly projecting collar keyed rigidly on the protruding end of the swingable piece of live axle, a roomy recess being formed on the inner side of the hub on the rim of which a wheel is built in a plane intersecting the swingable piece of live axle through its bearing in the swingable piece of axle casing; horizontal gudgeons forwardly and rearwardly disposed on the centrally located housing of the differential gear, a recess on the back end of the back gudgeons, rollers in the recess and a bearing on the yieldably supported body of the vehicle back of and against the rollers, bearings rotatably fastened on the gudgeons, leaf springs across the bearings and fastened thereto the outer ends of the springs being fastened across under the front end of the body of the vehicle supporting it yieldably and hiding the axle mechanism substantially at right angles across the front of the vehicle.

942,883. Hub Odometer. Harry P. C. Browne, New York, N. Y. Filed Nov. 4,

1907. Serial No. 400,605.

1. In a hub odometer, the combination with a fixed axle and a rotating hub of a hollow housing mounted over the end of said hub and axle a supporting piece secured in said hollow housing, a spindle pivoted in said supporting piece, a cyclometer carried by said spindle, an arm also carried by said spindle, and a second arm held against rotation and engaging the first arm, substantially as described.

942,910. Speed Changing Mechanism. Emil E. Keller, Pittsburg, Pa. Filed Nov. 14, 1905. Serial No. 287,312.

1. In combination with a motor driven shaft, a shaft to be driven therefrom, a friction gear device between said shafts and means movable longitudinally of the shaft to be driven and the operation of which is dependent upon the torque encountered for varying the speed ratio of said friction gear device.

942,913. Power Transmission Mechanism. Emil E. Keller, Pittsburg, Pa. Filed Dec. 13, 1905. Serial No. 291,512. Renewed Aug. 24, 1909. Serial No. 514,451.

1. In a power transmission mechanism, a plurality of power transmission gears, co-operating clutch devices, a load responsive device for controlling the operation of said clutches which comprises a driving member, a driven member, yielding means whereby said driven member is caused to move longitudinally in response to variations of load and means for rendering the motion of said driving member effective in controlling the operation of said clutches.

942,957. Starting Device for Internal

Combustion Engines. Paschal G. Caspian, Chicago, Ill. Filed Nov. 6, 1908. Serial No. 461,390.

1. In starting devices for internal combustion engines, a valve plug connected to and operable by one of the engine shafts, a valve casing within which said valve plug is located, connections leading from the valve casing to the several cylinders, each of said connections being disposed in a common plane transversely of the valve casing, an arcuate port formed in the valve plug and arranged to consecutively register with the said connections, a supply port leading to the casing and arranged in a horizontal plane distant from that of the other connections, and a connecting port leading through the valve plug and communicating with the arcuate port.

942,977. Carburetter. Johan C. Simonson, Elkhart, Ind. Filed Dec. 28, 1908. Serial No. 469,598.

1. A carburetter including an L-shaped carburetting chamber, a diluting chamber above the carburetting chamber and communicating therewith, a hydro-carbon chamber surrounding the carburetting chamber, a valve chamber at one side of the last named chamber, a boat controlled valve in the valve chamber, an iris diaphragm to adjust the intake opening to the carburetting chamber, a nozzle communicating with the hydro-carbon chamber and terminating near the axis of the diaphragm and also having its axis substantially at right angles to the axis of the diaphragm, a needle valve to the nozzle, a spring controlled valve to admit air to the diluting chamber, and a throttle valve to regulate the flow from the diluting chamber to the engine.

943,029. Vehicle Wheel Rim. Paul W. Litchfield, Akron, Ohio, assignor to The Goodyear Tire and Rubber Company, Akron, Ohio, a Corporation of Ohio. Filed Aug. 10, 1908. Serial No. 447,770.

1. A vehicle wheel rim of the class described having a seat for a tire, an outwardly extending flange along one side edge thereof and an offset extending inwardly from said tire on the opposite side edge, the latter provided with a channel, a split locking ring adapted to be sprung into said channel provided with a rabbeted portion adjacent to said tire seat, the horizontal face of said rabbeted portion being approximately flush with said tire seat, and a pair of endless tire retaining devices capable of lateral movement on and a reversal of position around said rim, one of said tire-retaining devices adapted to be engaged by said outwardly extending flange, the other by said locking device and when positioned to lap the horizontal face of the rabbeted portion thereof when in either position, one of the sides of each of said tire retaining devices fashioned to engage a clincher tire shoe and the other an inextensible edge tire-shoe, respectively, substantially as and for the purpose described.

943,215. Electric Switch. Henry J. Carrigan and Arthur J. Sangster, Buffalo, N. Y., assignors to Auto Safety Specialty Company, a Corporation of New York. Filed Sept. 22, 1908. Serial No. 454,196.

1. An electric switch comprising an annular row of fixed contacts any two of which are adapted to be connected with opposite sides of an electric current, two rotatable contact arms which are adapted to engage with said fixed contacts independently of each other, an outer hollow shaft carrying one of said contact arms, and an inner shaft arranged within the outer shaft and carrying the other contact arm.

## RUBBER RISES AND SOLIDS GO UP

Up-river Para Reaches Record Breaking Price and May Advance to \$3 per Pound—Effect on Tire Prices.

Rubber this week reached the highest price that it ever has attained since being put on the market as a commercial product, the fine upriver Para quality being quoted at \$2.56 per pound, and as a consequence of the high prices now prevailing the tire manufacturers have made a horizontal advance of 15 per cent. on the prices of solid tires. Confidential advices from South America to one of the big tire companies indicate that a price of \$3 per pound or more is not only possible, but extremely likely before the year is out, which would have the effect of again raising the prices on all rubber tires, whether pneumatic or solid.

Col. Samuel P. Colt, president of the United States Rubber Co., which through its subsidiary, the Rubber Goods Mfg. Co., controls the Hartford Rubber Works, Morgan & Wright and the G & J Tire Co., offers partial confirmation of the expectation of continued high prices in the rubber market.

"I would not be surprised to see the price of crude rubber continue to rule high during the balance of 1910," he declares, "although I look for some relief next year when a large increase is expected in the output of the plantations at Ceylon and the Strait Settlements, the quality coming from these plantations being of the same botanical order as that of fine Para from the Amazon used for similar purposes."

Although this week there arrived from South America the steamer Clement with 1,432 tons of rubber, a cargo worth about \$7,000,000, there was no drop in the quotations in the New York market, as practically all of the cargo had been contracted for far in advance. It is explained by a prominent dealer that the recent sharp advance has caused the dealers to withdraw offerings and that the quotations at present

are to a great extent nominal, the American buyers holding off for more favorable prices. Europe, however, is taking a heavy supply, so that crude rubber is being delivered as fast as it is shipped.

The extent of the advance in the price of rubber is made sharply apparent when it is recalled that in 1908 upriver Para was as low as 67 cents per pound, making the record price of this week equal an advance of 282 per cent.

### Bosch to Build Plant Near Springfield.

Brightwood, a part of Chicopee, Mass., and a suburb of Springfield, has been selected by the Bosch Magneto Co. as the place where it is to build a series of three large factories for the manufacture of Bosch magnetos. Arrangements have been made for the purchase of seven acres of land, between the Boston & Maine railroad tracks and North Main street, the company asking that the railroad move one of its crossings and supply spur tracks to the site, and that Chicopee provide a curb line and a sewer for the property. The first factory is to be started as soon as the frost is out of the ground and will employ about 700 men. The second and third factories will not be built immediately, but are to be put up after the first factory is under full headway, the plant ultimately employing 2,000 men, according to the company's estimate. Each of the buildings will be concrete, 385x66 feet, and will have an equipment of from \$75,000 to \$100,000 in machinery and tools. Meanwhile, the Bosch plant in New York will be maintained.

### Willys Gives Dallas High Hopes.

Dallas, Tex., is basking in the possibility of having an assembling factory for cars made by the Willys-Overland Co., of Toledo, O. President Willys is making a tour of the Southwest with a view to establishing such a factory, it is said, and Dallas may be made the point at which cars for that portion of the country will be assembled, from parts supplied from the Toledo or the Indianapolis plants and shipped in bulk.

## STUDEBAKER BUYS E-M-F

Detroit Owners Finally Yield at a High Figure—Purchase Effected by Morgan & Co.—Flanders to Remain and All Litigation Terminates.

All the difficulties which have existed between the E-M-F. Co., of Detroit, Mich., and the Studebaker interests, of South Bend, Ind., this week were swept aside by the outright purchase of the E-M-F. Co. by the Studebakers. The deal, which is sensational in its magnitude and in the abruptness with which it was consummated, was brought about by the acceptance on the part of the E-M-F. stockholders in Detroit of eight times the par value of their stock, after their having refused several recent tempting offers.

About \$5,000,000 in cash was paid for the 64 per cent of stock held in Detroit, the deal being accomplished through the aid of J. P. Morgan & Co., acting in accordance with an agreement with the stockholders of the Studebaker Bros. Mfg. Co., of South Bend. The Studebakers already owned 36 per cent., but the remaining 64 per cent. was held as a unit by the Detroit group consisting of Walter E. Flanders, president and general manager of the E-M-F. Co.; Charles L. Palms, treasurer; Dr. J. B. Book, vice-president, and William T. Barbour, together with E. Le Roy Pelletier, advertising manager, and the holders of smaller blocks of the shares. These stockholders were paid by Morgan & Co. on a basis of \$8,000,000 for the total issue of \$1,000,000 par value of E-M-F. stock, and it is estimated that they received an equivalent of \$32 for every dollar originally invested a year and a half ago.

Under the new arrangement Walter E. Flanders will continue as president and general manager of the E-M-F. Co. for a period of three years. He also remains as a member of the board of directors, and retains a block of stock under the reorganization.

Messrs. Book, Palms and Barbour retire as members of the board of directors, and their places will be taken by Messrs. Delafield and Stevens, of the Morgan firm. Pelletier is scheduled to remain with Flanders. Almost needless to say, all litigation between E-M-F. and Studebaker is to be dropped.

The whole transaction was concluded in New York City early yesterday (Wednesday), in time for President Flanders to take the Wolverine Flyer back to Detroit. On the same day there was incorporated at Albany, under New York State laws, a corporation known as the Studebaker Vehicle Co., of New York, with a capitalization of \$8,600,000, "to manufacture automobiles and other vehicles and supplies." The directors of the new company include Frederick P. Delafield, the Morgan representative on the reorganized E-M-F. board; Clement Studebaker, Jr., Frederick S. Fish and Scott Brown, of South Bend, and Frederick W. Longfellow, of Riverdale-on-Hudson, N. Y. This incorporation is taken to be the creation of the Studebaker holding company for the E-M-F. property, and may even pre-empt the big flotation which Fish, who is chairman of the Studebaker executive committee, admitted in court, during the injunction litigation against E-M-F., had been contemplated, with a proposed capitalization of from \$80,000,000 to \$100,000,000. Dr. Book, the retiring E-M-F. vice-president, is quoted as saying that the property ultimately will be capitalized at from \$30,000,000 to \$50,000,000.

Because of the late split between the Studebakers and the E-M-F. Co., as a result of which the latter refused longer to supply the Studebaker selling organization with E-M-F. cars and proceeded to appoint its own agents direct, a somewhat delicate situation has been created, but assurance is given that all contracts made by the E-M-F. Co. with agents will be carried out. In those cities where the Studebaker agents have not been succeeded by E-M-F. appointees in the handling of E-M-F. cars it is likely that the line will be restored to them promptly.

The fact that J. P. Morgan & Co. appeared as the purchasers of the E-M-F. property created a host of more or less wild rumors among the uninitiated, one report having it that Morgan personally was organizing a \$300,000,000 combination to control the whole automobile industry and in time would devote some of the present big automobile plants to aeroplane manufacture as well. Others traced a connection between the E-M-F. purchase and the recently organized United States Motor Co., in which a son-in-law of Morgan is known to be interested, but officials of the latter enterprise deny that E-M-F. is related to their plans.

The E-M-F. plants in Detroit are among the largest in the country, and the company, according to official figures, has sold over \$3,000,000 worth of cars during its com-

paratively short period of existence. At present it is shipping 65 or more cars of the E-M-F. "Thirty" type per day, and last month it commenced the delivery of the Flanders "Twenty," of which it is planned to have a production of 100 per day by the first of May.

#### New Departure Takes Over Houpt.

The New Departure Mfg. Co., of Bristol, Conn., which for some time has been making the Houpt cars for the Harry S. Houpt Mfg. Co., of New York City, has taken over the latter concern, and in addition to its other activities will continue to manufacture the car, the name of which is to be changed to the Houpt-Rockwell. The separate identity of the two concerns will be maintained, but A. F. Rockwell, president of the New Departure company, has assumed the presidency of the Houpt company, with De Witt Page as vice-president, and Charles Terry Treadwell treasurer. Harry S. Houpt has been retained as secretary and general manager, and the salesrooms at 2008 Broadway will be continued. The Houpt-Rockwell will be supplied in two models, these being a four cylinder 60 horsepower car at \$5,000, and a six cylinder 90 horsepower type at \$6,000.

#### Evince Confidence in Croxton-Keeton.

Satisfied as to the future of the company members of the board of trade of Massillon, O., have themselves bought \$12,000 worth of the 500 preferred shares of stock in the Croxton-Keeton Motor Co., of that city, which they have arranged to dispose of in order that the company's plant may be greatly enlarged. E. C. Merwin and Frank H. Synder have been added to the board of directors, representing Massillon stockholders. O. P. Bernhart, until recently vice-president and general manager of the company, has removed to New York, to become vice-president and general manager of the Croxton-Keeton company of New York, which handles the Croxton-Keeton product in the East.

#### Newbro Heads Beyster Truck.

The Beyster Motor Truck Co., of Detroit, Mich., has been reorganized and with new capital will erect two factory buildings at an estimated cost of \$200,000 for buildings and equipment. D. M. Newbro is the new president, the other officers being Benson E. Brown, vice-president and sales manager; E. E. Gallogly, treasurer, and Edgar E. Murray, secretary and general manager. Henry Beyster will be the general superintendent and chief engineer. Alexander McPherson, president of the Old Detroit National Bank is one of the stockholders. The company plans to make a 1,250 pound truck to sell for \$1,250.

#### To Make Bearings in Spokane.

The Patent Holdings & Mfg. Co., of Spokane Wash., a new concern recently incorporated at \$3,000,000, has taken over the

stock of the Diamond Carriage Works, one of Spokane's big industries, and will use the factories thus acquired for the manufacture of Ban Luben roller bearings. An additional factory, to cost \$15,000, will be built on Second avenue, adjoining the carriage works, to make bearings for automobile purposes. The company also has arranged to build a branch plant in Calgary, Alberta, Canada. The officers of the concern are C. O. Bassett, president and business manager; J. C. Mountain, vice-president and general manager, and S. S. Bassett, secretary-treasurer.

#### Berkshire Bought Out and Reorganized.

Controlling interest in the Berkshire Motor Car Co., of Pittsfield, Mass., has been bought by Stuart H. Clapp and James Addison, who will assume active management of the property. John McQuaid, who has been manager of the company for the last few months, will retire, having disposed of his holdings. The concern, which is capitalized at \$120,000, will have Addison as president and treasurer, and Clapp as vice-president and sales manager. After the company has completed its contemplated output of 75 cars for this year, the plant is to be enlarged with the aid of additional capital which has been enlisted.

#### Snutsel Sails on Splitdorf Mission.

Paul L. Snutsel, of the Splitdorf Laboratory, New York City, sails for Europe on the 12th inst. for an extended trip of six months or more in the interests of the Splitdorf magneto. He will go direct to Turin, Italy, where he will have charge of the Splitdorf exhibit at the automobile show to be held there in April, after which he will visit automobile manufacturers in France, Belgium, Germany and England, with a view to extending the already considerable use of Splitdorf magnetos on "the other side."

#### Bailey Truck Another Detroit.

The Bailey Motor Truck Co. is among the most recent additions to Detroit's constantly expanding list of automobile manufacturing enterprises. The concern has been capitalized at \$100,000, and proposes to make the Bailey truck, of about one ton capacity. The backers of the enterprise include Thomas E. Reeder, manager, and C. F. Mellish, assistant manager of the Hargreaven Mfg. Co.; E. R. Stoughton and C. W. Baird.

#### Tracy Gets Michelin Chicago Branch.

R. B. Tracy has been appointed manager of the Chicago branch of the Michelin Tire Co., of Milltown, N. J., to succeed C. C. Harbridge, who, with J. C. Zimmerman, William Seward, Jr., and Hugh Jackson, has resigned from the Michelin service in Chicago to open at 1312 Michigan avenue as the Federal Rubber Co. of Illinois, handling Federal tires. Tracy has been manager of the Michelin branch in Cleveland, O.

**EXPORT YEAR BEGINS BOOMLIKE**

**January Shipments Total Nearly a Quarter Million Dollars—Gains are Fairly General Throughout the World.**

Exports of American motor cars are continuing to rise. During the month of January, 1910, there were shipped abroad three times as many machines as during the corresponding month of the preceding year, the quantities being 492 and 167, respectively. The average value of the exported cars decreased, however, from \$1,428 to \$1,183. As the average value of exported cars during the month of December, 1909 was \$1,099, a slight upward tendency is noticeable once more. The aggregate value of the 492 cars was \$582,255; that of the parts \$136,335; the total value of both being \$718,590, compared with \$292,995 during the same period of 1909; the gain in car values amounts to 244 per cent.; that in the value of parts to over 250 per cent.

Italy, which had been steadily reducing its imports of American cars, this month shows a gain, amounting to \$3,000, while Mexico, which so far has been a growing customer, took \$1,137 less than during January, 1909. The greatest actual gain is presented by British North America where the value of cars imported from this country increased from \$53,271 to \$269,111, an advance of 405 per cent. The greatest proportionate gain, however, was shown by Germany, to which country were shipped during January \$6,292 worth, compared to \$210 in the corresponding period of 1909, a gain of almost 3,000 per cent. Noticeable increases also are shown by the United Kingdom, from \$45,785 to \$176,806, British Australasia from \$14,712 to \$40,874, and Oceania from \$5,707 to \$15,769.

For the seven months ending January, 1910, the figures generally are proportionate to those of the month of January, with the exception of Italy, where a total shipment of only \$25,761 is recorded for the full period, while January alone shows exports amounting to more than half this sum. The report in detail:

**To Build Bodies in Salt Lake.**

With the approval of the White Co., of Cleveland, O., there is to be built in Salt Lake City, Utah, a factory for the manufacture of bodies and for automobile repairs. P. R. Melchert, who for three years has been a White western representative, will be manager, and the enterprise is to be backed by Salt Lake capital. The plant, which will have three stories and a basement, will cost approximately \$50,000, and will be the Salt Lake headquarters for White cars. It will include a large display room and a garage, and will be built on First South street, between Second and Third East streets.

**American to Move to Lafayette.**

Negotiations have been completed by which the American Motor Car Co., of Indianapolis, Ind., will establish a factory in Lafayette, Ind., provided the citizens of the latter place purchase \$125,000 worth of 6 per cent. bonds of the company, pay \$25,000 to cover the expense of moving from Indianapolis, and donate five acres of land for a factory site. Lafayette business men have appointed a committee to carry out these provisions of the contract.

**Stephens Strikes Out for Himself.**

G. W. Stephens, who recently resigned as advertising manager of the G & J Tire Co., of Indianapolis, Ind., has been succeeded by W. B. Harding, the company's former purchasing agent. Stephens has gone into the tire and accessory business in Chicago on his own account.

**Pope to Produce a Six-Cylinder.**

Although the Pope Mfg. Co., of Hartford, Conn., heretofore has confined itself to a maximum of four cylinders, a new six-cylinder Pope-Hartford model is indicated as being in preparation. It is scheduled to make its appearance on the Pacific Coast in September or October.

**Jobbing Firm Starts in Oklahoma.**

Burwell & Smith are to establish a jobbing house of tires and accessories in Oklahoma City, Okla. The concern will open its establishment this month.

**DE LISSER GOES FROM TIRES TO CARS**

**Resigns Ajax-Grieb Presidency to Direct United States Merger's Sales—Also Becomes Official of Big Corporation.**

General management of the sales department of the United States Motor Co., the \$16,000,000 Maxwell-Briscoe and Columbia merger enterprise, has been placed in the hands of Horace De Lisser, whose election as a vice-president of the company was announced early this week. De Lisser, who has been president and general manager of the Ajax-Grieb Rubber Co., has resigned his connections with that company, and William G. Grieb, who has been vice-president and who before the organization of the Ajax-Grieb Rubber Co. was president of the Grieb Rubber Co., of Trenton, N. J., is to succeed De Lisser as president of the Ajax company, in which the Maxwell-Briscoe Co. is considerably interested.

Some slight hitch in the arrangements delayed the announcement of De Lisser as a vice-president of the United States Motor Co. following the organization meeting last week, and although it was understood on the outside that he had been included, official confirmation was withheld until the disclosure of his being given entire charge of the sales. His association with the United States company was at first taken as evidence that the Ajax-Grieb company had formally entered the merger, but that this is not the case is made plain by the emphasis that is placed on the separation of De Lisser from his Ajax connections in assuming his duties with the bigger company.

In 1894 De Lisser became identified with the rubber business when he conducted a large cycle tire factory in England, which later was sold to a London syndicate headed by Ellis Parr, the banker. In disposing of this business De Lisser agreed to remain out of rubber manufacturing for a term of five years. He then took the American agency for Worcestershire sauce, which condiment he popularized throughout the United States.

At the expiration of his agreement he went with the International Rubber Co., of Miltown, N. J., remaining with that company until the formation of the Ajax-Grieb Rubber Co., two years later. His wide experience in the management and the sales departments of his various enterprises is regarded as especially fitting him for the responsibilities involved in the management of the United States Motor Co.'s sales organization.

**Webb Jay Becomes the Chatauqua.**

The Webb Jay Motor Co., of Dunkirk, N. Y., has changed its name to the Chatauqua Motor Co. It will commence the erection of an automobile factory in the near future.

**THE WEEK'S INCORPORATIONS.**

Dunkirk, N. Y.—Webb Jay Motor Co., changes name to Chautauqua Motor Co.

Bellevue, Pa.—Bellevue Automobile Co., under Pennsylvania laws, with \$10,000 capital.

Philadelphia, Pa.—Taylor Motor Distributing Co., under Pennsylvania laws, with \$10,000 capital.

Philadelphia, Pa.—Krit Sales Co., under Pennsylvania laws with \$10,000 capital. Corporators—T. W. Pritchard and others.

Wilmington, Del.—Otto Motor Car Sales Co., under Delaware laws, with \$100,000 capital. Corporators—W. N. Akers, W. J. Maloney and E. B. Davis.

Wilmington, Del.—Railway Motor Car Corporation, under Delaware laws, with \$150,000 capital. Corporators—F. M. Shive, M. L. Rogers and H. W. Davis.

Dover, Del.—Auto Transit Co., under Delaware laws, with \$100,000 capital. Corporators—J. G. Gray, Thomas F. Magarity and C. P. Douglass, Wilmington.

New York, N. Y.—Hall Development Co., under New York laws, with \$100,000 capital; to manufacture motor vehicles, engines, etc. Corporators—H. A. Van Liew, H. P. Hall.

New York, N. Y.—Polar Motor Car Co., under New York laws, with \$5,000 capital; to manufacture automobiles, etc. Corporators—F. M. York, C. Kenney and M. Jones.

Buffalo, N. Y.—Seneca Rubber Co., under New York laws; to deal in vehicle tires and mechanical rubber goods. Corporators—Roswell Park, Jr., William L. Cramp and others.

South Bend, Ind.—Diamond Automobile Co., under Indiana laws, with \$50,000 capital; to manufacture and sell automobiles. Corporators—Joseph, Hannah and Grace E. Ricketts.

Columbus, O.—Reliance Truck & Garage Co., under Ohio laws; general automobile business. Corporators—Theodore Leonard, Andrew Timberman, George C. Bohn and Frank Trau.

Indianapolis, Ind.—Toops Auto Hood Co., under Indiana laws, with \$25,000 capital; to manufacture automobile specialties. Corporators—Emory D. Toops, Frank Schlusser and C. B. Clarke.

New York, N. Y.—Black Motor Car Co., under New York laws, with \$25,000 capital; to manufacture automobiles, engines, etc. Corporators—C. C. Darnall, Chicago, Ill.; O. F. Rost, Mt. Vernon, N. Y.

Peekskill, N. Y.—Lawson Motor Car & Garage Co., under New York laws, with \$75,000 capital; to manufacture and deal in automobiles, etc. Corporators—W., A. and M. S. Lawson, all of Peekskill.

Detroit, Mich.—Bailey Motor Truck Co., under Michigan laws, with \$100,000 capital; to manufacture commercial vehicles. Corporators—Thomas E. Reeder, C. F. Mellish, E. R. Stoughton and C. E. Baird.

Peoria, Ill.—Mackemer Motor Car Co.

Co., under Illinois laws, with \$5,000 capital; to repair and deal in motor vehicles and appliances. Corporators—E. M. Mackemer, H. B. Pinkerton and Sieboa Reents.

Newark, N. J.—Newark Motor Car Co., under New Jersey laws, with \$50,000 capital; general automobile business. Corporators—Jerome M. Schwerin, William F. Schupe, Fred Dudley and A. A. Russell.

Guttenburg, N. J.—Hudson County Automobile Co., under New Jersey laws, with \$10,000 capital; to manufacture automobiles, motors, cars, etc. Corporators—Stuart J. Lebach, George W. and Henry H. Kern.

New York, N. Y.—Modern Storage Battery Co., under New York laws, with \$125,000; to manufacture and deal in storage batteries and electrical goods. Corporators—J. J. Harper, E. J. Forhan and G. F. Martin.

Camden, N. J.—American Taxicab Co. of Pittsburg, Pa., under New Jersey laws, with \$50,000 capital; general transfer and express business. Corporators—V. A. Murray, J. R. Bradley and H. C. Elliott, all of Camden.

Buffalo, N. Y.—Polson Mfg. Co., under New York laws, with \$5,000 capital; to manufacture wind shields, glass fronts and automobile accessories. Corporators—Frank F., William F., and Mrs. William F. Polson.

White Plains, N. Y.—Cobb Motor Car Co., under New York laws, with \$5,000 capital; to manufacture and deal in automobiles, accessories, etc. Corporators—Frederick W. Cobb, J. O. Hobby, Jr., and Arthur I. Strang.

Bridgeport, Conn.—Automobile Dealers Association of Bridgeport, under Connecticut laws; to promote the general welfare of dealers in automobiles and accessories and to promote contests and exhibitions of the same.

Chicago, Ill.—Motor Body & Trimming Co., under Illinois laws, with \$2,500 capital; to manufacture and deal in motor vehicles, machinery and appliances. Corporators—D. H. Mann, Adolph Lindholm and W. S. Jameson.

Camden, N. J.—Chester Automobile Tire Co., under New Jersey laws, with \$500,000 capital; to manufacture tires and wheels for automobiles, bicycles, carriages, etc. Corporators—Joseph F. Swain, George M. Bryson and Wynn Armstrong.

New York, N. Y.—Liberty Radiator Co., under New York laws, with \$1,000 capital; to manufacture and repair radiators and automobile accessories; to deal in same. Corporators—Maxwell H. Elliott, John J. Quencer and George R. Casey.

New York, N. Y.—United Horse Subdrier Co., under New York laws, with \$50,000 capital; to manufacture and deal in electrical vehicles, etc. Corporators—P. J. Minck, Brooklyn; J. A. Marin, New York City, and W. A. Cooper, Jersey City, N. J.

New York, N. Y.—Hub Motor Co. of America, under New York laws, with \$1,000,000 capital; to manufacture and sell motors, engines and machinery of all kinds. Corpor-

ators—C. A. Spofford, New York City; P. S. Smith, C. Berg, Philadelphia, Pa.

New York, N. Y.—Duford Garage Co., under New York laws, with \$50,000 capital; general automobile business. Corporators—J. J. Pheelan, J. Santora and W. Kerruish.

Seattle, Wash.—Pennsylvania Motor Car Co. of Seattle, under Washington laws, with \$10,000 capital. Corporators—David W. West and John C. Hollingsworth.

**Increases of Capitalization.**

La Crosse, Wis.—R. L. Kenyon Co., from \$25,000 to \$50,000.

Akron, O.—Swinehart Tire & Rubber Co., from \$200,000 to \$400,000.

Detroit, Mich.—Metzger Motor Car Co., from \$500,000 to \$1,000,000.

Elkhart, Ind.—Elkhart Motor Car Co., from \$200,000 to \$1,000,000.

Milwaukee, Wis.—Variable Speed Clutch Co., from \$25,000 to \$100,000.

Findlay, O.—Findlay Carriage Co., from \$50,000 to \$150,000, and will engage in the manufacture of automobiles.

**Bretz in a Drop Forge Enterprise.**

J. S. Bretz and Jack L. Straub, of the J. S. Bretz Co., New York City, have become financially interested in the Rivetless Chain & Engineering Co., of Lebanon, Pa., an old established concern which heretofore has devoted itself wholly to producing a rivetless drop-forged chain, largely used in mining and conveying work, but which is now increasing its drop forge capacity, and is undertaking the manufacture of drop-forged parts for motor cars. The J. S. Bretz Co. has been appointed sole selling agent for the latter class of work.

**Freeman is Made Mora Manager.**

W. N. Freeman has been appointed to succeed W. W. Burke as manager of the New York branch of the Mora company. He has been with the company for several years, first as traveling representative and latterly as treasurer.

**Diamond Takes a Long Lease.**

The Diamond Rubber Co., of Akron, O., has taken a five years lease on the property at 807-9 Race street, Cincinnati, O., for a branch. The lease provides for the Diamond company adding another story to the one-story structure.

**Knox Buys More Factory Land.**

The Knox Automobile Co., of Springfield, Mass., has acquired an additional parcel of land, 132x50 feet, adjoining its present property. The purchase was made as a provision for future factory expansions.

**Brodhead to Build Motor Cars.**

The Brodhead Motor Car Co., of Brodhead, Wis., is preparing to build automobiles. The concern plans to make a four cylinder, five-passenger car at a low price.

## IN THE RETAIL WORLD.

Michael Back, Jr., Albany, N. Y., will erect a garage at 831-835 Madison avenue.

The Waynesboro (Pa.) Garage Co. has purchased the old market house and will convert it into a garage.

The Collins & Drake Automobile Co. has changed its name to the Collins Auto Co.; Drake has sold his interest to his partner and retired.

Caleb L. McKee, Columbus, O., will erect a garage on the west side of North Fourth street in the spring. It will be a one story brick structure.

Charles Broughton, De Kalb, Ill., has let the contract for a new garage to be built early in the spring. It will be located on West Main street.

F. L. Rinehart, Hartford, Ind., sees an opening for a garage in his town and is preparing to fill it. His establishment will include a repair shop.

H. C. Harrison, Lockport, N. Y., has leased the Holly water works building, which will be devoted to the manufacture of automobile supplies.

The Crown Automobile Co., Peoria, Ill., has completed arrangements for the erection of a one-story brick garage at 800 Main street. It will cost \$8,000.

The Des Moines (Ia.) Vulcanizing Co., located at 420 Eighth avenue, is figuring on an enlargement of its plant. Work on the addition will be begun shortly.

Robert Wright, Orange, N. J., has had plans drawn for a large garage to be located on the east side of Cleveland street. The building will be 40x100 feet.

F. M. Hoffman and A. Sharboro, Chicago, Ill., have joined forces to exploit the Cutting in western territory. They will have show rooms at 1330 Michigan avenue.

M. R. Dillin, of Philadelphia, Pa., is building a six-story garage, 51x83 feet, at 142-144 North Broad street, in the Quaker city. The cost will approximate \$80,000.

William Frisbee, Sheldon, Ia., has acquired an interest in the Sheldon Automobile Co. He will not be a stranger in his new venture, having had ripe experience.

E. G. Reimers, Louisville, Ky., is preparing to erect a two story brick and concrete garage in the rear of 716-718 Baxter street. The plans call for an expenditure of \$8,500.

D. V. Purdy, Ft. Wayne, Ind., has taken possession of a garage in Van Wert, O., which he recently purchased. He formerly was connected with the Wayne Oil Tank Co.

Headed by George M. Weber, the Weber Automobile Co. has been formed in Indianapolis, Ind., to handle Apperson cars. It will have salesrooms at 16 South Capitol avenue.

J. M. Clarke, sales manager of the National Motor Vehicle Co., of Indianapolis, Ind., has resigned to enter the retail field.

He has taken the National agency in Denver, Col.

Everitt S. Hilton, former manager of the Eastern branch of Morgan & Wright, has taken over the Regal-Detroit Auto Co. The concern has the New York city distribution of Regal cars.

William D. Clarkson, now at Waynesboro, Pa., will open a garage in Hagerstown, Md., this month. The establishment will be located in the rear of the Shelton, on West Franklin street.

The Central Garage Co. is the style of a new firm which has "opened up" at 125 South Park street, Streator, Ill. The building is 53x140 feet, of concrete blocks; Moline cars are shown.

Thomas W. Meiklejohn, Fond du Lac, Wis., has purchased an interest in the agency of A. T. Haber, and the firm will be known as Haber & Meiklejohn. They have the Ford representation.

Bridgeport, Conn., automobile dealers have formed an association and filed articles of incorporation. Its objects are to advance the general welfare of its members, and to promote contests and exhibitions.

The Woodsdale (W. Va.) Motor Car Co., which is located in a suburb of Wheeling, W. Va., has taken possession of its new garage, which includes a well appointed repair shop. They handle the Chalmers and Hudson.

The Texas Motor Sales Co., which has headquarters in Fort Worth is preparing to establish branches, in Dallas, Oklahoma City, Okla., and several other southwestern cities. It markets the Marmon, Cole and Richmond.

Glenn Frazell, a prominent Springfield (O.) dealer, has invaded Dayton, and has taken show rooms at 227-229 South Main street, where he will handle the E-M-F. He, however, will retain his Springfield establishment.

Johnson & Fortune, Findlay, O., are remodeling the Edwards property on North Main street, preparatory to embarking in the automobile business. They will take the agency for a car and also conduct a general garage business.

Newell Matthews Co., Los Angeles, Cal., who represent the Whiting and Westcott cars in the Angel City, have joined the Olive street motor colony. They have taken quarters in a handsome establishment at 595 South Olive street.

The Electric Auto Station Co., Hartford, Conn., one of the hardy young concerns of the Nutmeg capital, soon will let the contract for the erection of a large garage on Church street below High. It has the agency for the Baker electric.

The Ford Motor Co., Detroit, Mich., has conducted a blacksmith shop in connection with their garage on Seventh street, have discontinued the former enterprise and will devote themselves exclusively to automo-

biles. The building will be remodeled to meet the business changes.

C. P. Brewster, manager of the United Manufacturers branch in Cleveland, O., has resigned that position to enter the field of motor car selling. He has joined the forces of the Olds-Oakland Co., of Cleveland, as state and city salesman.

The Ford Motor Co., Detroit, Mich., has purchased a plot at the northeast corner of Woodward avenue and East Grand boulevard with a frontage of 117 feet on the former thoroughfare. It will erect a large sales building on the property.

New quarters are being prepared at the corner of Main and Globe streets, Peoria, Ill., for the Crown Auto Co., to be ready for occupancy on April 1st. Besides doing a general garage business the company will handle the Waverley electrics.

McArthur & Zollar is the style of a new firm in Minneapolis, Minn., which has the agency for the Black Crow, Everitt, Babcock and American Simplex. The salesrooms and garage are located at Nicollet avenue and Thirteenth street.

The City Motor Car Co., Houston, Tex., just has opened up in that place at 709 Louisiana street. W. W. and C. O. Weir and E. F. Holmes constitute the firm, which in addition to conducting a general garage business, will market the Pittsburg Six.

The garage of Tynan & Reynolds, 173-175 Van Houten street, Paterson, N. J., which recently was wiped out by fire, will be rebuilt by the owner of the property, M. A. Beekman. The new structure will be two stories, 50x100 feet, and will cost \$3,800.

The Atwood Automobile Co., Toledo, O., has leased the former Dollar Savings Bank building on Madison avenue and will occupy it as a downtown branch salesroom. The new quarters, which are in the heart of the financial district, will be opened about April 1st.

L. S. Mariger, Salt Lake City, Utah, who operates a line of sight seeing cars in the Mormon capital, has entered the commercial selling field and will handle the Rapid line. For the present the new venture will be exploited from his bus garage, 257 First South street.

The Taylor Motor Distributing Co., is the style of a new concern which has begun business in Philadelphia, Pa., with offices in the Real Estate Trust building. William T. Taylor is president of the concern, which will market Warren-Detroit in the Middle Atlantic states.

The Broadway Automobile Exchange, New York City, of which Louis C. Jandorf is president, has acquired the property at the northeast corner of Eleventh avenue and Fifty-eighth street, consisting of a two-story and basement factory building 100x100. After extensive alterations the purchasers will occupy the premises for manufacturing purposes in connection with their present business of selling used cars.

# The Satisfaction of being "Up-to-Date"

A Little Talk on owning a

# White Gasoline Car

**T**HERE is a certain real satisfaction which comes through the possession of any article which is, in every respect, thoroughly up-to-date. In fact, almost all "shopping" consists of a search for the goods of latest pattern and embodying the latest ideas. In purchasing a motor car, it is particularly important to secure the latest design because the art has been advancing so rapidly that those cars, the design of which dates back two or three years, do not possess many of the desirable features which the present state of the art makes possible.

The owner of a White gasoline car has the satisfaction of knowing that the design of his car is at least one year in advance of any other American machine and that he will see the features which he NOW has in his car adopted by other makers next year and the year after. Among these up-to-date features are the "long-stroke" engine, the casting of the four cylinders en bloc with only about one-fourth of the usual amount of piping, the four-speed transmission, etc.

The owner of a White gasoline car can be even more proud of its QUALITY than of its up-to-date design. There is no part of the car which could be made of any better material or could be constructed with more care, even if the selling price of the car were one thousand dollars greater.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, MARCH 10, 1910.

### Clause that Should be Amended.

There is one clause in the bill drafted by the American Automobile Association, which is pending in New York State and which is held up as a model law, that is not easily defended—i. e., the clause applying to the use of non-skidding devices, which is as follows:

Subd. 2.—Use of Nonskidding Devices.—No person shall operate or drive on the public highways of this state a motor vehicle on any of whose wheels is a tire chain or a nonskidding contrivance or tire composed in whole or in part of metal, except when such highways are wet and slippery or covered with ice or snow.

This clause will clearly legislate out of use a number of well known tires possessing permanent non-skid treads; as they cannot be removed when snow disappears or mud and water dry, they cannot be used at all. This would serve to leave the field clear for tire chains which readily can be detached, and this circumstance has led

to charges or insinuations affecting the motives which inspired the clause. The Motor World, however, has too much regard for Mr. Charles Thaddeus Terry, the head of the A. A. A. legislative board and the author of the bill, to share these suspicions. But as the effect of the clause is apparent and as its sweeping nature scarcely can have been realized, it does appear that no time should be lost in amending it. This easily can be done to the satisfaction of all parties.

If the language of the clause is altered so as to prohibit the use of "a tire chain or other detachable nonskidding contrivance composed in whole or in part of metal, except," etc., all difficulty will be obviated and all unpleasant suspicions be allayed. As tire chains readily are detachable, their use will not be affected, and as the idea that non-skid treads such as form parts of present day tires injure the roads has been pretty well exploded, there is no occasion for legislating against them. The amendment should be effected without delay or much argument, and it most gracefully can come from those who proposed the bill.

### "Marooning" New Jersey's Motorists.

New Jersey men are said to be taking more than usual interest in the much-mixed effort to evolve a new automobile law for New York State. They are more or less fearful that New York, like Pennsylvania and Delaware, may impose a reciprocity condition on non-residents, which means chiefly themselves, since, thanks to the lovely Senator Frelinghuysen, who lives in New York and votes in and makes laws for New Jersey, the latter state has set itself against reciprocity and demands an "admission fee" from all motorists who would cross its borders.

If New York adopts a reciprocity clause, the New Jersey men will be indeed "marooned," as one of them not inaptly describes it. Before they will be able to enter any of the three neighboring states, they must "stand and deliver," as already they must do when they go into Pennsylvania and Delaware. It is a sorry state of affairs and a stiff price to pay for Frelinghuysenism and is sufficient to cause the victims of it to reflect long and bitterly. The wonder of it all is that Frelinghuysen is able so persistently to maintain his position and block every effort to make New Jersey a "free" state. He is said to be holding up the bill passed by the Assembly

which will open the state to non-residents and the adjoining states to the Jersey men, and apparently the only hope of relief rests in his reported ambition to become Governor; political selfishness or expediency may cause him to move himself out of the way and thus permit the bill to become a law.

For more than one reason it is to be hoped that this may come to pass and that Frelinghuysen will become a gubernatorial candidate. It would enable the motorists of New Jersey to strike a blow that would be heard from ocean to ocean and that would do more to promote the passage of sane and reasonable legislation everywhere than all the legislative hearings that ever have occurred or may occur. There is one power which all politicians respect, and that is the power of the ballot. The defeat of a Frelinghuysen at the polls would demonstrate possession of that power in a fashion that is not to be denied and that would exert immediate and far-reaching effect. The motorists of New Jersey ought to be able to bring enough of it to bear to swing the balance of power, and after such a long period of oppression, which their prospective marooning makes worse, they will be queer creatures if they do not make the effort. It will be worth all it may cost.

### Amazing Influence of Star-Gazing.

It's about time for whoever has been doing so to quit "kidding" The Automobile. Our intensely profound and almost reverend contemporary deserves better treatment. Its desire to be taken seriously should be respected, even if it has fallen into the habit of erecting tombstones or semi-mourning borders in the center of its pages and of "dressing" cars in semi-quivers and curlicues and trimming engines with Scotch plaids and other dry goods effects, to say nothing of including well known men in its department of more or less "prominent accessories." That sort of thing represents serious effort—effort of the kind that causes brains to operate like accordions and that affords entertainment for all those who desire to obtain it without moving out of their chairs.

But just because The Automobile thus is striving to prove that it really is blithesome and gay and not nearly so heavy as it feels, is no reason why anyone should fill it fuller with prunes or "kid" it with figures, in boxes or out of them. "Figures don't lie," they say, and when anyone induces

a publication to fly in the face of such a maxim it is time for protest—serious protest. It is taking mean advantage of a trusting nature. Who, for instance, could have induced our respected and highly respectable contemporary to take such a long, sweet peep, first into that dim, dead past which is beyond recall and then a longer and sweeter excursion into the far future and the future which is not so far and of which men—most men—know nothing?

The effect is delicious, but it should cause the wholesale issuance of search warrants; for if what The Automobile says is even half true, there are nearly two hundred thousand motor cars that have disappeared so mysteriously as to suggest that they were carried off under the coats or in the vest pockets of men who were supposed to be far, far above suspicion. The Automobile says there were 80,000 cars produced in America in 1907, 130,000 in 1908 and 200,000 in 1909, whereas men versed in industrial statistics have placed the production of those years at not exceeding 40,000, 60,000 and 130,000, respectively. The discrepancy—the loss of 180,000 automobiles in three years—is too great to pass unnoticed. They must be somewhere, and they should be sought for. Every man should search himself. He may have one or more concealed about his person without knowing it. If he finds none, he should look into his children's playroom. Santa Claus may have left a few of them there and the kiddies may be playing "choo-choo cars" with them.

It is rather important that these missing cars be located, as The Automobile's flight into the future portends similar and greater mysteries. After reading the stars and the Milky Way it has found that during the present year of grace not less than 300,000 cars will be manufactured—a figure which will cause that optimistic prophet who reached to the 200,000 mark to feel queer and to sing small forevermore. But the worst—or best—is yet to come! For star-gazing has convinced The Automobile that during each succeeding year the production will increase 50 per cent., so that in 1915 there will be manufactured a trifle of 2,278,000 cars and there then will be in use 5,900,000 of them, or one for every sixteenth person in the United States.

Those will be happy days, for mankind and for horses, too. There probably will be a garage attached to every flat and tene-

ment house for the use of the tenants, while Dobbin will be gamboling on the roof or seated on silken cushions on the parlor sofa. For by 1913 "every delivery wagon, truck, farm wagon, cab and omnibus" having been "replaced by an auto"—that's what our contemporary says—the horse probably will take the place of the lap dog, while the street cars, subways and elevated lines will be covered inches deep with cobwebs. If the simple 50 per cent annual increase holds true after 1915 it will not be long thereafter before schoolboys will be able to use automobiles as marbles and schoolgirls to play "jacks" with them.

We confess ourselves out of patience that our contemporary should have left its story incompleting. Why it did not figure how many times its automobiles placed end to end will reach around the earth, or, piled high, how near they will reach to heaven, is almost inexplicable. We hope this omission will be rectified, and if the rectification brings with it tables showing the number of times the engines will turn over and the number of times the valves will open, etc., the added figures will increase the impressiveness of the presentment.

Seriously, The Automobile should cease fooling itself or trying to fool others. Such figures as it prints are a reflection on its intelligence and its sources of information and they serve no useful purpose. They do more harm than good. If The Automobile is not "fooling," it should engage some one to awaken it and to keep it awake. We all can enjoy a good dream, but most men can distinguish between a good dream and a nightmare.

No craze ever attained greater proportions than the bicycle craze and no vehicle of locomotion was or is so simple, so convenient, so compact, or so economical as the bicycle; its price was within the reach of the masses; it was easily and quickly manufactured, and there were just as many factories engaged in producing them as now are producing automobiles; but not in its wildest delirium did its production attain such proportions as The Automobile so blithely places to the ultimate credit of the automobile industry. The bicycle has its limitations; so, too, has the motor car. Among other things, while one bicycle carries but one person, one automobile will carry from two to seven persons, which means something when calculating at a 16 to 1 ratio.

## COMING EVENTS

March 1-19, Fort Worth, Tex.—Fort Worth Automobile Dealers' Association's first annual show in Coliseum.

March 5-12, Boston, Mass.—Boston Automobile Dealers Association's eighth annual show in Mechanics Building.

March 5-12, Cleveland, O.—Cleveland Automobile Club's eighth annual show in Central Armory.

March 5-12, Des Moines, Ia.—Des Moines Automobile Dealers Association's first annual show in Coliseum.

March 12-19, Syracuse, N. Y.—Syracuse Automobile Dealers Association's annual show in State Armory.

March 14-19, Cedar Rapids, Ia.—Automobile show in Auditorium.

March 15, Daytona, Fla.—De Palma-Oldfield match race.

March 17-19, Louisville, Ky.—Louisville Automobile Dealers Association's annual show in Armory.

March 19, Altadena, Cal.—Annual Pasadena-Altadena hill climb.

March 19-26, Aberdeen, S. D.—First annual automobile show.

March 20, San Francisco, Cal.—San Francisco Motor Club's hill climb on Nineteenth avenue hill.

March 21-26, Spokane, Wash.—Spokane Automobile Dealers' Association's first annual show in Princess Rink.

March 22-24, Daytona, Fla.—Florida East Coast Automobile Association's eighth annual beach speed carnival.

March 26-April 2, Montreal, Can.—Fourth National Automobile and Sportsmen's show.

March 26-April 2, Pittsburg, Pa.—Pittsburg Automobile Dealers Association's fourth annual show in Duquesne Garden.

March 28-April 2, Indianapolis, Ind.—Indianapolis Automobile Trade Association's first annual show in individual show rooms.

March 28-29, Savannah, Ga.—Savannah Automobile Club's 675 miles endurance run to Jacksonville, Fla.

April 4-9, Elmira, N. Y.—Elmira Chamber of Commerce's first annual automobile show.

April 8-17, Los Angeles, Cal.—Inaugural meet on the new Los Angeles Motordrome.

April 11-18, Springfield, Mo.—Springfield Chamber of Commerce's first automobile show.

April 12-16, Springfield, Ill.—Springfield Chamber of Commerce's first annual automobile show in Arsenal.

April 18-23, Bangor, Me.—Second annual automobile show in Auditorium.

June 1, Berlin, Germany.—Start of Prince Henry tour, finishing at Homburg on 8th.

# Boston's Big Show and Some Apple Trees

Nearly All the Well Known Cars in Evidence and Some That Were Not Shown Before—Display of Commercials Particularly Impressive—Apple Trees, Such as Never Grew, in Full Bloom, Canaries Carol and the Spirea Van Houtii, too, are there.

Dear old Boston! There are some things in which it is not easily possible to beat the prim old lady.

She long and justly has had the reputation for being able so deftly to "make over"

sands of dollars expended for decorative treatment, Boston never even clucks about its costs. Rather do her word-painters portray mind-pictures of buds and blossoms, birds and brooks, pergolas and peristyles,

tinctly pleasing, even if critics may observe that some of them are reminiscent or have been "warmed over."

To say nothing of the balcony and the basement, which do not readily lend them-

SOME OF THE CARS AND PART OF THE "APPLE ORCHARD" IN EXHIBITION HALL

her old bonnet or her old gown that even her next door neighbor has difficulty in recognizing it, and her skill in warming over a meal so that it appears or tastes like a fresh one, equally is well known. They are thrifty folk in that neck of the woods. They can stretch a dollar bill until it looks like a landscape, and their nimble fingers can do it with such adroitness as to compel admiration.

For several successive years, the Boston automobile show has served as an apt illustration of such deftness, and the one which opened in Mechanics Building on Saturday evening last, and which will hold the boards until next Saturday night, is no exception to the rule. There is none of the big shows that can compare with it in this respect. While the chanticleers of the New York and Chicago functions crow lustily of the twenty-five, fifty and one hundred or more thou-

colonnades and columnar effects and such like; and the net result is quite as effective as the dollar-trumpeting.

This is true of the show now current. The crowds have flocked in satisfying numbers and they have not cared a rap or a button or a bean whether the decorations cost thirty-three cents or thirty-three thousand dollars.

"It's a pretty show," is a very general verdict, which occasionally is varied by a "Prettier even than New York or Chicago" remark of men who viewed the national exhibitions in both of those cities. And p-o-s-s-i-b-l-y it is prettier, in the same sense that dainty Dolly Twinkletoes may be prettier than the queenly Evelyn Devere, or the stately Madame Elderberry; anything is possible, you know—and in this case it doesn't make any difference, any way. For the effect of the Boston decorations is dis-

selves to decorative treatment, the Boston show comprises two parts—one part made up of the exhibits staged in Grand Hall, with its high and lofty ceiling, the other comprising the displays in Exhibition Hall, with its low and obtrusive posts and rafters; the halls connect one with the other. The visitor first enters Exhibition Hall. Forgetting motor cars for the moment, and agitating the accelerator of his imagination, he beholds himself in a bully make-believe apple orchard in full bloom, and if his ears are sharp and one of the two female orchestras—"patented" in Boston and rarely infringed by any other show—is not making music, he will hear the warble of birds—real ones—not in gilded cages, but real canaries in those little wooden prisons just as they come from the bird stores. The birds are positioned in the apple trees. And those apple trees! Wow! Their trunks

ANOTHER VIEW OF THE APPLE ORCHARD IN EXHIBITION HALL

are slabs of bark—chiefly spruce—about as they came from the sawmill, which are nailed around the obtruding posts which support the rafters; the boughs, which are nailed to the bark, are of all sizes, shapes and varieties, and the job of nailing the bark to the posts, and the boughs to the bark was roughly and cheaply done, and at close range the "trees" are remarkable creations. Some are in leaf, others are leafless, but all are abloom; the blossoms are large and their delicate whites and pinks cause the imperfections of the "trees" to be forgotten, and despite anything that may have been said, the effect obtained is surprisingly pretty and from a distance strongly suggestive of the apple orchard which it represents. The exhibitors' signs, of rough board, are suspended from the trees and the exhibits themselves are separated by low fences stained a weathered green. Grey-green rugs contribute harmony, and a painted and continuous landscape covers the walls and furthers the outdoor "atmosphere." The landscape is not done in either oils or water colors; it is a splendid piece of kalsomining and looks all right in a photograph. In the "light well" of Exhibition Hall there are loopings of white and green bunting—and an aeroplane, without which apparently no local or neighborhood show of 1910 appears to have been complete.

And, passing this way, ladies and gentlemen, we enter Grand Hall! Pretty, isn't it? Observe the sky! No, it did not cost \$10,000 like the one at Chicago, and it is not the largest sky in captivity. It is mere-

A TREE AND A BIRDIE

ly sky blue bunting, price 5 cents per yard. Take notice of the white colonnade or arbor erected on the balcony, and the vines thereon. A little later the white-gowned orchestra will play there, and still later, a human canary—also of the female gender—will thrill you with her tuneful carolings and carry your minds far from motor cars. (Boston still loves her sweet voiced songstress.) Of course, you have not failed to notice the festoons of pink roses and foliage around the balcony railing, which lend such dainty coloring to the scene; and your eyes could not well fail to absorb the central piece—that white pergola banked high with real flowers. And talking of flowers, ladies and gentlemen, we call your attention to the fact that real flowers, and not rail fences separate the exhibits in Grand Hall. Those are lilacs and tulips in those green troughs, and that tall shrub with the small white blossom is the famous spirea van houtii. It is of the same family as the spirea reevesii and the spirea prunifolia, and it is the first time in history that the van houtii plant ever has blossomed in an automobile show. Please remember that whenever you think of Boston! And now, if you please, we will visit the galleries where there is not so much decoration, but a wealth of accessories, or we will descend to the basement and view the trucks and

GENERAL VIEW OF THE DISPLAY IN GRAND HALL

the wagons. Meanwhile, if you desire peanuts, popcorn, lemonade or candy, you will be able to purchase it at any of the several stands we have passed. You will find the prices very reasonable.

In addition to or wholly apart from its decorative treatment, the Boston show is, as usual, a fine large affair. No one except the management ever is able to say exactly how many exhibitors the big building houses, as in respect to accessories at least, there always seems room for "one more" even after the eleventh hour, and, in fact, until the doors close on the last day. Numerous small jimcracks creep in during the week and not all of them pertain to motor cars. The program always contains not a few names wholly unknown to the automobile industry and which cause the man who compiles the summary of exhibitors some vexed moments. Last year, one of these compilers took a chance when he found an unknown spring company listed as an exhibitor by promptly writing it down as displaying automobile springs. His eyes bulged when at the show he found the company had spring water for sale. This year, John Quincy Adams was found to be selling dictionaries, while exhibitors possessing less famous names were found to be marketing such things as candy, face grease, pianos, vacuum cleaners and photo papers.

Because of this condition of things, the total number of exhibitors at the show always is subject to discount. Last year there were 258, of whom 87 staged 409 vehicles

CENTRAL PERGOLA IN GRAND HALL

and 168 other things. This year there are 87 exhibits of cars and 197 of accessories and "other things," a total of 284. The num-

ber of vehicles in evidence again is 409. Most, but not all, of them are shown in the names of the local agents, but practically all of the eye-catchers which were displayed at New York and Chicago by the manufacturers themselves are in evidence. The Thomas tumbling chassis and New York-Paris car and trophy are there; so, too, are the cutaway and working chassis of the Chalmers and the Hudson. The P-S, the Winton and the other striking torpedo bodies likewise are on hand, together with the usual display of silverware, not forgetting even the Vanderbilt cup, which, of course, is an Alco exhibit.

The display of commercial vehicles in the basement is an impressive one. It probably is the best representation of such cars that ever has been made and illustrates vividly the progress that has been made of the construction of the "big fellows." One of these truck exhibitors introduced a new wrinkle, too. His truck being so large and his space too small to permit of a desk and chairs being placed on the floor, this office equipment was placed in the truck itself. It was a novel sight to thus see men climbing onto the truck to seat themselves beside a man doing business at a desk and with telephone and electric drop-light and other office appointments in plain sight. The adaptability of the big trucks

was also illustrated by the White company, whose vehicle came to the show loaded with all of the White show furniture and fixtures.

It was in the basement, too, that two real novelties of the show cropped out—the Hariman rotary gas engine and the Teel valveless two-cycle motor without crank case compression.

Most of the accessories were displayed on the galleries, however, and at least one, the Casgrain hydraulic speedometer, is displayed in strikingly original fashion. One

new but no less striking body designs are on view. But perhaps nothing could give just the required touch of up-to-dateness, which it is necessary to cultivate in the terminal city of the Boston and Maine Railroad, than the influx of torpedo bodies. Because, as everyone knows full well, while some of the structures which are limited in the picture books under this warlike title really suggest very strongly just a plain touring car with high side doors in front, they really are in a class by themselves for the reason that they afford a degree of pro-

tection for the passengers hitherto undreamed of. Strange as it may seem, Boston musters more torpedo bodies than any single show yet held—more even than the Palace and Garden shows in New York could count between them. There are an even 20 machines to be seen in and about Mechanics Building which answer to the general definition of the torpedo, five of them being designed for two passengers only, and the remainder for four stout passengers or four normal ones and one thin one. Chicago's display accounted for a baker's dozen of the sort, while in New York there were seven in the Palace and just 10 in the Garden.

Other torpedos shown in various parts

COLONNADE ON THE BALCONY IN GRAND HALL.  
The arrow indicates the location of the famous Spirea Van Houti

of the instruments is frozen fast in the center of a large cake of ice, while another of them is contained in a glass-front oven provided with a thermometer which indicates that it is being subjected to 110 degrees of heat. As the accompanying placard makes plain, this novel demonstration is designed to prove that the speedometer is not affected by temperature.

#### Torpedoes and "Show Cars" Plentiful.

Considering the general display of cars, it is noteworthy that the manufacturers as a whole have by no means skimmed their local representatives in affording them material for exhibition purposes. Indeed, in many instances, the show cars which have done duty at the four national shows of the season—the last one having been in Chicago—again appear. In other instances,

tection for the passengers hitherto undreamed of.

Strange as it may seem, Boston musters more torpedo bodies than any single show yet held—more even than the Palace and Garden shows in New York could count between them. There are an even 20 machines to be seen in and about Mechanics Building which answer to the general definition of the torpedo, five of them being designed for two passengers only, and the remainder for four stout passengers or four normal ones and one thin one. Chicago's display accounted for a baker's dozen of the sort, while in New York there were seven in the Palace and just 10 in the Garden.

Among the cars of this type which have not appeared before may be mentioned the Franklin, which, instead of the French type

of the big building include the two P-S creations, the Winton runabout, which has traveled the whole show circuit, and incidentally has come to be known as the "hard boiled egg," owing to its spheroidal posterior; the black Winton touring torpedo, and the White, Columbia, Selden, McCue, and Stoddard-Dayton cars. The new Morse car is similarly equipped as to one of its examples, while the new Marmon torpedo broadly suggests that some day someone may invent a design convertible from touring to "torpedoing" operations. While a true torpedo, it has much the same lines as the stock touring car, with a few necessary modifications.

That highly ornamental feature of all automobile exhibitions, the show car, however, is by no means all torpedo, in Boston. For example, there are a number of most

excellent and distinctly practical limousines—such, for example, as the Stevens-Duryea, Pierce-Arrow and Stearns, while the Chalmers product is brought out in the form of a most attractive little inside driven coupe, among others. Aided in its spectacular effect by its conspicuous position in the very center of the stage in Grand Hall, the Packard double limousine is calculated to attract a deal of attention in consequence of its vermilion and black color scheme, as well as because of the complete enclosure of all the seats which it effects. The same product is displayed in the white and gold confection which has been the rounds of all the big shows of the present season. Immediately in front of the stage a peculiarly effective shade of green masks a Winton rumble runabout, which is distinguished, among other things, by an ingenious form of folding top which when collapsed is released from its normal fastenings, the lower ends of the bows being dropped sufficiently so that the upper portion of the top ceases to obstruct the vision of the recluse on the dicky seat. A somewhat similar device is used on a Knox runabout.

There is a green Pope-Hartford car also, while a Pierce-Arrow roadster in grey affords somewhat the practical effect of the "battleship" shade, which is much affected by some sporting motorists, without the unfinished and raw suggestion which that unglossed pigment produces. As a rule, however, bright and glaring colors are replaced by the more ordinary shades of the stock cars on such stands as the Mitchell, Jackson, Apperson, Premier, Studebaker and Alco. The little Krit is the only brand new car shown in this portion of the exhibition, though the Ohio, in a neighboring booth, is both a new product and one not before seen in Boston.

Under the apple blossoms in Exhibition Hall a number of the older and better known manufacturers are represented at stands with which they have been identified at practically all the Boston shows. Exhibits of this order include the Rambler, Locomobile, Ford, Marmon, Columbia, Stearns and Maxwell cars. The sectioned and moving chassis illustrative of the Chalmers and Hudson methods of construction occupy the same space as was used for Chalmers products one year ago, while the new four-cylinder Reo and its stand mates, the practical Overland and the Marion racing runabout have a cross-connecting aisle all to themselves. Three Matheson sixes and one of the big four-cylinder touring machines are placed at the head of the hall, while the Inter-State, Selden, National—shown only in chassis and racing runabout forms—the little Hupmobile and the Kline car, the latter making its bow to New England, line the second of the two avenues which lead from the principal entrance to Grand Hall.

Despite the good offices of the decorators, a certain feeling of depression, due perhaps to its subterranean location, attends

the visitor on his way to the basement. Nor is the feeling wholly relieved by the gross confusion of the exhibits, which have been shuffled about until they are sadly lacking in classification. Accessories and commercial cars are there in goodly array, not to mention the telephone operators ensconced in their glass cage. Also, there are an abundance of good pleasure cars which deserve better treatment at the hands of the management. For instance, the little Brush runabout is jammed in between the flamboyant and more or less noisy display of a manufacturer of stationary gas engines and charging outfits and the huge bulk of the Morgan truck. Just opposite it is the Corbin display, where the visitor is rendered more or less uncomfortable by the heat which radiates from the adjoining power plant from which the feeble light of the basement is derived. Back to back with the Brush display is that wherein are demonstrated the advantages of the Lambert friction drive, and also the pedal motor starting device with which one of the Lambert models is regularly equipped this year.

Various other cars, mostly rather large ones, overhang very small spaces in the neighborhood, their attendants complaining that because of the small area available other cars have had to be garaged during the show, instead of being put on view, which, in instances where such machines have been freighted long distances just for show purposes, tends to induce unpleasant thoughts in the breasts of the visitors.

The Schacht exhibit is on a well-traveled thoroughfare, but in an ill-lighted corner, where the advantages of the "three-purpose" car are hard to see, if easy to comprehend. Better fortune has befallen the exhibitor of the Fuller line, however, which, by the way, is counted among those new to Boston, and also among those which, upon the purchaser's requirement, may be equipped with solid tires. Firestone gasoline and electric cars and the two white chassis, which render conspicuous the location of the E-M-F. "30" and Flanders "20" cars, are in an even better situation as regards accessibility and visibility. The latter car, of course, makes its initial appearance in Boston at this time, and is conspicuous among the newcomers because of the logical way in which it has been developed as a companion to the widely known "big sister" E-M-F.

#### CARS NOT SEEN AT OTHER SHOWS.

One or more "native" products invariably appear at Boston, as at many other local shows of greater or less magnitude, but this year only one of the sort is to be found, as against four which made their debut at the 1909 show. The new standard bearer for New England is the Morse, which is built by the Easton Machine Co., of South Easton, Mass. The makers have been producing cars in a small way since 1904, while developing their design, but the present exhibition is the first at which the

machine has made a public appearance.

In construction the Morse evidences a number of entirely original devices. As a whole, it is of generally standard proportions, but it is entirely free from the marks which invariably identify the parts which have been bought in the open market. It is a high class product, in that expensive materials are used throughout, and no marks of manufacturing economy are visible. The motor, which is the most distinctive portion of the chassis, is of entirely original construction. The valves are located side by side in the head, an unusual point being the enlargement of the upper end of the cylinder bore, which is cored away at the combustion head to permit the application of valves of greater diameter than would be possible were the bore proper carried up to the head. The valves are liberally jacketed and are actuated by short walking beams from a single cam shaft. Incidentally, a neat detail is revealed in the method of enclosing the push-rod lifters and their springs, which are capped by brass covers secured by an adapted form of bayonet lock, instead of screw threads. The four vertical cylinders are of  $4\frac{1}{2}$  inches bore and 5 inches stroke, the rating being quoted at 24 horse—"European."

The engine base is cased with strong flanges on either side, which extend out to the side frame members, forming a closed dust pan and also staying the front part of the chassis against distortion. The lower part of the case is divided into two sections, the lower forming a sump, for the oiling system. This system is distinguished by the use of only two external pipes, the remainder of the circulation being carried out through cored passages. The gear pump itself is housed in a chamber which is cast in the base.

The transmission system includes multiple disc clutch, four-speed selective change gear and shaft drive. The clutch is original in form, contains only nine saw-blade steel discs, and is applied by a helical spring through adjustable cone and finger mechanism, the adjustment feature being such that any slack may be taken up without disarranging any of the connecting parts. The change gear is distinguished by direct through third speed connections, and a geared up fourth speed. The rear axle is of massive construction, employing a torsion tube shaft housing, stayed and swung on a ball pivot in front. Scroll and full elliptic springs in the rear and semi-elliptic in the rear, 36 by  $4\frac{1}{2}$  inch tires and 127 inch wheel base complete the major specifications. From Eisemann dual ignition apparatus throughout, the standard equipment is of the best.

Of the several cars which are new to Boston and the East, as well as of recent introduction to the market, one of the popular small runabout class is the Krit. Unfortunately for Boston show goers, only the chassis is to be seen, owing to an unlucky

smash which the finished vehicle suffered while in transit by freight from the factory. The chassis reveals neat lines, compact construction and a number of thoroughly up-to-date and pleasing features. The motor is of the four-cylinder block type, with  $3\frac{3}{4}$  by 4 inch bore stroke, 22 $\frac{1}{2}$  rated horsepower, thermo-syphon cooling and Bosch magneto ignition built with set spark adjustment. The power plant is of unit construction, the flywheel, clutch and change gear being housed with the engine crank shaft in a separable aluminum enclosure, which is hung from three points, a single cradling point in front, and one on either side in the rear. The clutch is of the multi-

sis is remarkably free from superfluous mechanism, and appears well fitted for the work for which it is intended. Double internal and external rear wheel brakes, one set of which is applied by the single pedal which also throws out the clutch; 32 by 3 inch tires and 96 inch wheel base, are the principal dimensions not already mentioned.

Another new Detroit product, which has not before been shown in the East during the brief interval which has elapsed since its introduction, is the Warren-Detroit. It is shown in three-passenger roadster run-about form, and in clean and modish lines and comfortable appearance is suited to take

with a round 30 gallon tank in the rear, replacing the extra seat. The same chassis also may be had mounted with a small tonneau body and fitted with 34 by  $3\frac{1}{2}$  inch tires, but otherwise unchanged. The standard equipment includes, in addition to the dash and tail lamps, a pair of 8 inch headlights, generator, horn and complete set of machine and engine tools.

Paterson, a name long associated with the traditions of the carriage trade, lately has come to be listed among automobile products by reason of the W. A. Patterson Co.'s introduction of the Patterson "30." It is shown here for the first time, being, in-

GENEROUS EXHIBIT OF WHITE CARS IN GRAND HALL

ple disc type, and the gearset affords two forward speeds in addition to the reverse, with selective actuation.

The most original feature of the car is the rear axle design, which embodies the idea which is best expressed by the term lever suspension, which has been adopted by another maker who uses somewhat the same principle in a slightly different manner. Instead of being mounted on the axle in the usual way, the single transverse, semi-elliptical spring which supports the rear of the chassis is shackled at either end to an arm extending forward from the axle for a few inches. The tendency to rotate the axle which this brings about is resisted by the torsion tube itself and by the two diagonal braces which serve to maintain the alignment of the axle. Thus a part of the dead load of the car is carried forward to the ball socket joint back of the gear change, where it reacts against and practically counteracts the upward moving tendency of the torque tube, which is caused by the torsional stresses due to propulsion. The chas-

a favorable position in the growing line of 30 horsepower cars. It is equipped with a block motor of 4 by  $4\frac{1}{2}$  inch bore and stroke, with valves on the same side, double ignition, leather-faced cone clutch, three-speed selective gearset and shaft drive. The general arrangement and proportions of the parts are thoroughly standardized—indeed, it is one of the selling arguments of the machine that it is completely standardized throughout. Special design has been adopted in the gearset, however, which is of the type in which the main and lay shafts lie side by side.

The wheels are 32 inches in diameter, shod with  $3\frac{1}{2}$  inch tires; the spring suspension is  $\frac{3}{4}$  elliptic in the rear and semi-elliptical in front; the frame is of pressed steel construction, with sub frame to carry the power plant, the rear of the main structure being raised in the rear to afford proper clearance over the axle. In the form of body shown, the gasoline tank is carried under the front seat. As an option, however, the runabout type may be equipped

deed, one of the latest innovations of the middle West, and hailing from Flint, Mich. The car is driven by a compact little four-cylinder engine of rather conventional design, having a single cam shaft on the right, which involves the concentration of the valves and gear and the carburetter on the left side of the vehicle, while only the magneto is carried on the right. The cylinders are of "square" dimensions—that is to say, having 4 inches bore and stroke, thus affording an A. L. A. M. rating of 25 $\frac{3}{4}$  horsepower. Cooling is by gravity circulation.

With the gear case and clutch housing, a unit power plant is formed, which is hung from four points, the gearset overhanging the rear support so that the lugs which are attached to the frame bear the load at points of high concentration, and the casing which is used mainly for protective purposes is relieved of stresses which are foreign to its principal intent. The change gear affords three forward speeds and is selectively actuated. Final drive is through a double jointed cardan shaft to a semi-floating rear

axle. The rear axle is mounted on roller bearings; the forward member, which likewise is of tubular construction, is equipped with ball bearings for the wheels. The wheel base is 106 inches, 32 by 3½ inch tires are used, and the spring suspension is full elliptical behind and semi-elliptical in front. The vehicle is exhibited in touring form, with a clean lined, conventional body equipped with top and full equipment.

The Standard Six, rather an impressive looking machine of many original, though few radical, points, is also among those shown for the first time in Boston. Although a new car in construction, it is of well-known lineage, being a direct descendent, in a commercial sense, of the American Mors, which it has superseded. In the use of high grade materials and parts constructed with an eye to performance rather than manufacturing economies, it evidences careful work on the part of the designer, and is distinctive especially in point of engine design.

The valve-in-the-head type of design has been adopted, with overhead walking beam actuation, from a single cam shaft, which is placed on the left side of the car. The valve construction, including the removable cages, is noteworthy for the considerable length of jacket space which is carried over the combustion chamber, as well as by the way in which the inlet and exhaust ports have been cored out of the heads, leaving the cylinder exteriors of smooth contour. The cylinders are cast in pairs, 4½ by 5 inch dimensions, and the horsepower output is 50 under brake test. Dual ignition is employed, the magneto and pump being mounted accessibly, on the cam shaft side of the motor. The intake and exhaust piping and the carburettor alone occupy the right side of the engine. The crank case is of simple exterior formation and is suspended by heavy independent brackets, which afford the effect of three point suspension.

Three-speed selective gearset, shaft drive, and inverted cone clutch with cork inserts are the transmission features, while the rear load is carried on a full floating, Timken bearing axle. The wheel base is 124 inches, and the tires are 36 by 4.

Johnson cars, but little known in the East, have been familiar for a number of years in the middle West states. Within a twelve-month they have been metamorphosed and, having been deprived of their steam power plants and otherwise altered, now appear as practically a new line. Although the Johnson Service Co., of Milwaukee, Wis., its producer, also is engaged in the production of a full line of commercial vehicles, only the pleasure car is exhibited in the show. This is known as the Johnson Special, and is a touring car. It is well to note also that two larger models are known respectively as Elite and Empress, although they are practically enlarged versions of the special model.

This vehicle is characterized as assembled from parts produced almost entirely by the manufacturers of the car, who also specialize in components to the trade in general. While its design is not strikingly radical, it reveals originality at every point, from the mere formation of the dome head cylinders, which have the valves mounted side by side on the left side of the car, to the rear axle, which is of torque tube construction and distinguished by a very large spherical differential housing, together with tapered sections for the axle ends and torsion tube.

The motor has 4¼ by 4¼ inch cylinders, water cooled, and is rated at 30 horsepower. Atwater-Kent ignition is standard equipment, with magneto installation furnished optionally and under protest, as the makers are convinced of the superiority of the single spark system. The wheel base is 112 inches, and the tire equipment is of 32 by 3½ inch sizes. Other details of construction are the splash lubrication system for the motor, which has pump feed and automatic leveling provision; the cone clutch with leather facing and relieving springs, and the selective sliding gearset.

Welch cars have been on the market for a long time, but the Welch-Detroit is a new product, despite the familiarity of the first part of the compound appellation. The new Welch, as its name indicates, is to be distinguished from its older relative, now known as the Welch-Pontiac. The latter, as shown, retains many of its original characteristics, and continues to be produced at the old stand. The newer model, which has not before been shown in the East, which is built by the same company, but in Detroit, instead of Pontiac, Mich., is intended for a slightly different class of buyer, and accordingly is produced in a little smaller power than the original car, and, at a lower price.

The new machine is a four-cylinder, water-cooled machine of 45 rated horsepower, with 5 by 5 inch cylinders, 36 by 4 by 4½ inch tires, and 122 inch wheel base. The cylinders are cast in pairs, the change gear is selective and the transmission by shaft and live rear axle.

A new model of the Pontiac car, promised for the show, had not arrived during the early part of the week. Its rating is 80 horsepower, and it is listed to carry either selective change gear control or the peculiar individual clutch and selective control system, which long has been identified with the name.

Age has somewhat increased the size of the Velie cars. It was only a year ago that the first machine of its class brought the name to New England. The remodeled product is known as the Velie "40," to distinguish it from the "30" car of the last show, which is to say, among other things, that it has a larger motor. The dimensions of the new prime mover are 4½ by 5¼ inches, bore and stroke. Other new features

are the 115 inch wheel base, Gemmer steering gear and full floating rear axle, instead of semi-floating, such as was used formerly. Some idea of the care with which the parts are assembled may be gained from the statement that the motor and clutch together furnish employment to no less than eight F & S. ball bearings, while 16 sets of Timken roller bearings are used on the front and rear axles and in the selective gearset. One neat and rather novel detail in the control of the mechanism, which should appeal to the driver of experience, is the placing of the accelerator and muffler cut-out pedals side by side, between the clutch and brake controls, in such a way that they can be operated simultaneously, if desired. Both take the form of rocking segments, which may be applied without lifting the foot from the toe board.

Grout cars have been known in Massachusetts ever since the days when steam was universally popular and the gasoline engine was regarded with deep distrust and more or less awe as well. In the new models the engine power has been increased from 35 to 45 horse, and a few other changes have been made. But in the main the construction is retained, much in the same form as that which was used last year, when the car was brought out in generally remodeled form. The cylinder dimensions of the new motor are 4¾ by 5 inches. The cylinders are individually cast, with the valves placed side by side on the right side of the machine, and magneto ignition is employed. The cone clutch, selective gearset and shaft drive are other leading features. The wheel base is 123 inches, and the tire sizes are 36 by 4 inches, instead of 34 by 4, as last year. The five and seven passenger bodies are from new designs, and considerably assist in the modernizing of the product.

After the lapse of two years, the Berkshire has come into the high light of the show with an improved chassis, which, nevertheless, differs little from that of the previous model, so far as the structure is concerned. Limited space allotment in the basement prevents the display of the finished vehicle, but the stripped running gear is complete and instructive as far as it goes. The engine dimensions are 4 11-16 by 5½ inches, and the rating is 35-40. The engine is of standard water cooled form, with 2¼ inch valves, well, proportioned circulating system, Bosch magneto ignition and other thorough going details.

Lubrication of the engine is carried out by means of the popular pressure feed, crank case circulatory system; but the precise arrangement employed has been worked out especially for this machine. Instead of the usual sight-feed indicator on the dash, a gauge is employed, which at all times records the pressure in the system.

In the main, the car is of standard construction; but considerable stress is laid upon the structure of the front axle, in demonstration, as it is of special design. It is

of the familiar I-beam section. Instead of being cast or drop forged in this form, however, it is forged in solid square section, and afterward the superfluous metal is profiled out. By this means the fibers of the metal are not subject to the distortion which it is considered may result from forging the part to its ultimate shape. The knuckle construction is solid looking, and provides for carrying the steering connecting rod behind the axle, while the drag link is led above the axle, instead of below it, where it is out of harm's way.

For a number of years Boston has been the scene of varied projects of the English Napier interests, and only a year ago, the American Napier Co. was incorporated to revive the business which had been carried on in a desultory way at Jamaica Plains, just outside the city. The Napier car exhibited in the basement, however, is not an offspring of this venture. Loud protestations on the part of the stand attendants affirm that, like themselves, the car is imported, and is being marketed in this country by A. N. Perry, who though maintaining headquarters at 47 Union avenue, Jamaica Plains, is in no way connected with the undertaking which was launched to flood the country with cars assembled from imported materials and parts built according to imported designs. The car displayed is the characteristic long green creation which is associated with the Napier name, and which is one of the oldest as well as one of the best known six cylinder products built. Structurally its features do not change from year to year to any important degree. Its synchronized ignition and hydraulic air regulator, which is a detail which has been adopted successfully by one or two American builders, are among its most strikingly original points.

Rainier cars of the latest model do not differ materially from those which were in use last year. In common with one or two other makers, they appear in several different parts of the show, owing to the management's peculiar faculty for sub-dividing Mechanics Hall into infinitesimal sections and then allotting various little parcels to the exhibitors in more or less erratic fashion. Continued adherence to the make and break system of ignition, and the peculiar and characteristic formation of the paired cylinder castings are among the features which are retained.

Steam cars, long held in greatest veneration in and around the "Hub," receive their greatest local support from the Stanley Motor Carriage Co. In principle, the Stanley steamers are not materially altered since last shown, but retain in wire-wound tubular boiler, two-cylinder double acting enclosed engine, and in the regulating devices, much of the same material as has been used before. Carriage work changes, however, chiefly have made possible the introduction

of a new 10 horsepower model in runabout form, and a 20 horsepower touring car. In both types, the cylinder dimensions have been increased, and in the smaller, the running gear has been strengthened and the wheel base increased. One important detail in engine construction which has been added to all models, is a diaphragm which divides the engine casing into two parts. This is a cast aluminum plate which extends across the casing between the cylinders and cross heads and strengthens the housing, besides separating it into two compartments, the one in which are the active parts, being flooded with oil.

The only other representative of the steam field is the White, which is exhibited in its customary position on the main floor. The rapid increase of interest in the new gasoline car, which is being shown for the first time in Boston, however, has cut down the available space to such an extent that only two of the remarkably successful steam cars are in evidence.

Only one exponent of the solid tire in connection with the light pleasure vehicle is to be seen, which has not exhibited previously this year in the East. This is the Anderson, which is shown in the form of an open tray democrat wagon, which may be equipped with either one or two seats, but as shown, has but one, and therefore is suited directly for the uses of the small tradesman or farmer. The power plant is of the air-cooled, opposed type, with planetary change gear, and side chain drive. The Schacht, Hart-Kraft and Martin, are cars upon which the solid tire equipment is installed. But as they are intended mainly or wholly for commercial service, at least in the forms exhibited, it is thus plain that the true high-wheeled buggy, which in former years was generously represented at the show, has been supplanted by the true automobile, of which the solid tire equipment is a feature principally intended to assist in the necessary economies of commercial work.

Of the cars which have appeared at former Boston shows, but which are being exhibited this year in the guise of new and improved models, one of the most pleasing from the standpoint of neat and compact design is the Herreshoff. Although now being built in exactly the same outward form as when introduced to the Boston show public last year, sundry minor improvements have been worked into its structure, so that it is called a much better product than it was at that time. In the line of improvement the valve actuating mechanism has been redesigned, and a new cam follower introduced, which silences the tappet action most effectually, it is said, and also assists in the production of power to some slight degree.

A modern form of selective gearset has replaced the progressive form of change gear which first was used, and in one or two

other minor respects, conditions have been made more favorable to smooth and effective working. One noteworthy point in this connection is that the capacity of the water circulating system has been increased about 100 per cent. As this is of the thermosiphon variety, the point is an essential one. The body lines, "set-up," mechanism of control, save for the change gear lever, and equipment, combine to render the vehicle as "cobby" in appearance as it has been from the start.

#### STRIKING COMMERCIAL DISPLAY.

Perhaps never before in the annals of show history has the commercial vehicle element been staged to better advantage than at the present function at Boston. Besides, it is the largest collection of such products which ever has been shown in this country, so far as is known. The total number of commercial vehicles and chassis displayed is 62, whereas the commercial vehicle section of the Chicago show of 1907, the largest previous exhibit of its kind, mustered but 57 vehicles for the corresponding total. Last year, there were 40 commercial vehicles at the Boston show, including complete vehicles and chassis.

It is not in this respect, however, that the display assumes its chief value. Evidences that the builders who are devoting large shares of their attention to the commercial car problem, are beginning to work to definite and successful purpose are not lacking. Perhaps the most noteworthy and significant fact about the display is that a large proportion of the vehicles shown bear the names and business cards of their present owners, thereby giving a distinctly practical turn to the exhibits and giving the visitor an impression of activity in the market and really practical utility in the product. This impression is strengthened in the case of the huge exhibit of the Rapid cars, where nearly every one of the dozen vehicles shown, in addition to its own label or sign, bears a placard or two affording the information that a stated number of cars of corresponding type are now in use within striking distance of Boston. The names and addresses of the owners being given in every case, the effect is rendered particularly striking.

Technically speaking, progress in grappling with the difficulties of heavy vehicle transportation is evidenced in such massive trucks as the Studebaker, General and Couple-Gear electrics, and the White, Alco, Sampson and Morgan gasoline machines. The last named, indeed, being almost too large for its space, affords its maker ample "office" space in the wide expanse of its own body, whereon the desk, chairs, water cooler and other paraphernalia of the usual booth, are comfortably arranged. In each of the half-dozen machines enumerated, the huge bulk of the various parts, while lending a sort of spectacular interest from the standpoint of the layman, is by no means as significant as the fact that close design, inter-

changeability of parts and ready demountability of complete units has been worked out in a way which never has been deemed necessary in pleasure car practice. It is in the latter, quite as much as the former direction that evidences of mechanical progress may be taken as indicating that the commercial car is fast coming into its own.

News interest, of course, centers about such of the commercial cars as are absolutely new, from the viewpoint of the show goer. One of the most significant and pleasing members of this group is the White commercial vehicle, which is shown in both 1½ and 3 ton capacities. Both types are equipped with the self-same compact little block type motor which is used in the new White gasoline car, and which is of 22.5 rated horsepower. The apparent discrepan-

the case of the Morgan product, the significant phrase "master unit system" has been introduced. The five "master units" involved in the machine are the engine, transmission, countershaft, chassis and springs, and the group composed of the axles and wheels—which, of course, is called a unit only by courtesy. Particular attention has been paid to securing the ready demountability of and accessibility to these elements, which, so far as possible, have been preserved as independent elements.

The motor, which is of original design and especially constructed to withstand the stresses of slow running and heavy duty, is of the four-cylinder vertical order, water cooled and of inverted valve construction, with removable cylinder heads. The cylinder dimensions are 5 by 5 inches, and the

means of a single speed lever which is used to shift the discs, which vehicle movement is regulated by a couple of pedals, one for forward and the other for reverse movement. The engine is a standard four-cylinder vertical product rated at 40 horsepower, and is mounted in front in the conventional way.

Special provision for interchangeability and accessibility of the mechanism is provided in the attachment of the body and cab, either of which may be removed by loosening four bolts.

Just two points in favor of the friction transmission for utility service are worth mentioning in this connection: The overstraining of the transmission parts, driving gear, and the stalling of the motor, such as might arise with geared mechanism from sudden throwing on of excessive loads, is forestalled with the arrangement in question by the slipping of the drive; and the renewal of the friction material, which arises at infrequent intervals, may be done at a cost of \$10 each time—which is far less than the cost of new gears, such as would be required in case the pinions of a standard transmission were stripped as a result of abuse.

WHITE TRUCK CARRING SHOW FURNITURE TO MECHANICS BUILDING

cy which exists in the use of the same engine for such widely varying loads is readily explained by the differences in gearing employed. Whereas the lighter commercial vehicle, when equipped with pneumatic tires, is capable of speeds up to 25 miles an hour under full load, the 3-ton machine is only arranged to run up to 10 or 12 miles an hour under load. The longer "leverage" of the lower gear, naturally gives the engine its required advantage in the second instance.

Both trucks are built along the most approved commercial vehicle lines, with bodies supported on the chassis by means of cross ties. The smaller vehicle is equipped with a shaft drive, full floating axle, and twin pneumatic rear tires as stock equipment. Both types employ single tires in front. The 1½ ton car is sprung on semi-elliptical members, both front and rear; but the heavy truck is carried by a massive and most effective looking three-quarter platform arrangement in the rear.

Enormous strength is revealed in the construction of the Morgan truck, which is one of the several commercial vehicles exhibited for the first time. Furthermore, the machine furnishes a good example of the way in which the elements of the commercial vehicle may be divided for the purpose of facilitating the work of maintenance. In

rated output is 40 horsepower. The standard wheelbase is 120 inches; the wheels are 36 inches in diameter, and they are shod with 6-inch single solid tires in front and 4-inch twin solids in the rear. Three sets of brakes are employed—namely, two of the internal expanding order, which are mounted on the driving wheels, and one on the transmission.

The change gear is of the planetary order, unique in that its connection with the transverse countershaft is made by means of a leather diaphragm coupling, which allows for ample flexure in the alignment of parts, and at the same time is easy and cheap to replace. The countershaft is provided with a simple form of differential lock, which is coming to be considered an essential for heavy vehicle work.

Ample arguments in favor of the disc form of transmission change speed gear are advanced by the makers of the new Garford truck, which, although demonstrated in New York City during the recent shows, has not been seen inside any of the big shows up to this time. Its most striking feature is the adaptation of the four-disc friction drive to heavy vehicle work, which is done by means of the usual pinion reversing device and short chain on one side. Speed control in both directions is maintained by

Although not exhibited in the Eastern shows this year, the Couple-Gear electric commercial vehicle is a product which is pretty generally and favorably known. Its novelty in comparison with other exhibits in the commercial department of the show arises at once from its being the only product on view to employ the four-wheel drive principle and because its mechanical details are extraordinary in the annals of the commercial vehicle. Those who are familiar with its construction long have ceased to be skeptical of the advantages of the plan of making each wheel an independent driving unit, containing its own motor, while the unique way in which the motors are enclosed and mounted in the steel disc wheels and in which the power transmission is secured by means of pinions on the armature shafts which mesh with large bevel gears on the inner peripheries of the wheels is one which has proved most satisfactory in practice.

As the machine on view is jacked off the floor, the driving and steering movements are subject to sufficient demonstration for all practical purposes, while in addition the action of the motors is revealed by a single motor wheel, which is separately mounted for that special purpose. The only other moving commercial exhibit, it may be mentioned, is that of the General Vehicle Co.'s big truck chassis, which, also being electrically driven, may be operated without let or hindrance from the insurance authorities.

Previously exhibiting under its former name, the Atterbury Motor Car Co., of Buffalo, N. Y., has caused the Buffalo commercial line to come before the public. It

has not been seen in the shows this year, however, and may therefore be considered as virtually among the "previously un-seens." The two types exhibited are of the delivery order, and are distinguished by the use of only a half-width driver's seat in each case. This affords ready access to the interior of the body from the front—an ideal arrangement for delivery purposes. The machines are of two and four cylinder construction, respectively. The smaller of the two is of 16 horsepower, has an opposed, two-cylinder engine with  $4\frac{1}{2}$  by 4 inch cylinder dimensions, planetary change gear, and double chain drive. The larger machine has a quadruple, vertical motor of 20 rated horsepower, and with cylinders of  $3\frac{3}{4}$  by  $4\frac{1}{4}$  inches dimensions.

In both the planetary change gear and disc clutch are mounted in one unit with the counter shaft, and final drive is by double side chains. Both vehicles are staunchly put together, and are the lightest representatives of an expansive line of vehicles which the builders produce, the scope of the entire product covering practically all sorts of commercial machines, including heavy wagons of various patterns and sight-seeing machines.

Another line which is new to the shows this year is the Frayer-Miller, which is represented in the basement by two trucks, one sight-seeing vehicle and one chassis. Its long-familiar characteristic of forced draught air cooling is retained as a matter of course, as are practically all other fea-

tures which were in vogue last year. This line is shown in connection with the Buffalo and Randolph—an express type of vehicle which is equipped with an opposed motor, which, though exhibited in New York, is a newcomer in Boston—by D. P. Nichols Co., a Cambridge company which has built up a heavy business in commercial vehicle maintenance and body work the last two or three years.

Among other commercial exhibits should be mentioned the smaller of the two Studebaker electrics, which is a real "baker's cart"—the sort which is invariably associated in the mind of the country-bred New Englander with the use of sleigh bells in summer time. As an exemplification of the way in which the electric vehicle may be made to serve the needs of the city tradesman who requires prompt delivery for his wares, it is most apt, besides being sufficiently unusual to attract attention.

Knox construction is shown in a heavy truck and also in a fire patrol of flaring hue. A second vehicle of the same general class is the Pope-Hartford combination fire wagon, which rejoices in a conspicuous location where its unusual and striking appearance serves to good advantage. The Chase, Martin and Hart-Kraft, as well as two of the Gramm-Logan cars, fall under the classification of delivery wagons. The two remaining vehicles of the latter make are of the heavier order, and belong more nearly in the class of the Packard and Reliance big trucks. A new type of Reliance

commercial is shown for the first time, which has an opposed, 20 horsepower motor, and is of the light express order, though, unlike many machines intended for this class of service, shod with pneumatic tires. In another part of the basement a vehicle which, according to one of the attendants, is an exact duplicate of this product, is shown with a Buick sign attached to it; thus illustrating one of the benefits accruing from merger arrangements, inasmuch as both machines are General Motors products.

The Sampson and Alco trucks belong to the massive and obviously efficient order, and are perhaps the most impressive creations in the show. Both were shown in New York recently, and therefore are of interest chiefly to the local visitor insofar as mere contemplation of their outward characteristics is concerned. While both the Grabowsky and Autocar commercials were shown in New York as well, the latter is given a more extended presentation at Boston, and is shown in a good variety of types. One of these which was not shown in New York is a florist's wagon, built on a pleasure chassis, which is closed permanently in the rear and has full length doors on either side. The machine is finished in a particularly tasteful way and is perfectly accessible within, since the driver's seat is not carried out to the full width of the vehicle, but is left short enough to allow a passage from the front to the rear of the body.

## Several Striking Novelties Included in Boston's Accessory Display

Perhaps some people go to automobile shows just to see the regular cars and hear about their achievements on the race track and the highway; but if so, they are certain to catch the glint of light reflected from bright metal or hear the sputter of a fuzzy spark somewhere upstairs, and to go, as certainly as the little frightened bird walks up to the waiting serpent—straight to the abode of the accessory man. Everybody else does, and it is to be presumed that even the people who only come to see the regular cars and hear about their exploits take just one whirl through the galleries and the cavernous basement, too. For it is noteworthy that always there is "standing room only" where accessory things are being demonstrated.

Furthermore, the term accessory, during showtime, is given a sort of limber-jointed interpretation and is applied to everything that can get past the front office and settle down in a booth. Fruit, candy, cosmetics and cement building blocks are accessories, according to the Bostonese definition, and so is the Harriman engine.

But whether it be so considered, or deemed the first, seventh or fifteenth wonder of the show, the Harriman engine must be accorded a position of respectful atten-

tion, because in the first place, it is one of the few really startling inventions to be exhibited in the long run of automobile shows in Mechanics Hall which has prospered enough to come back a second time, and in the second place because it is a rotary engine which rotates under the influence of either steam or compressed and ignited gas. In other words, as a rotary steam engine, it is a very promising addition to a long line of attempts which have been made to solve an apparently simple puzzle, while, as an internal combustion motor of the rotary type, it is, so far as is known, the only one to be exhibited at a show while running under its own power.

Non-technical visitors are only mildly interested on being told that the rotary part of the engine consists merely of a shaft and an eccentric, or that the "rocking abutment" is the vital part which prevents the steam from slipping through the front hall and out the back door, so to speak; which is to say, leaking by the rotary piston and escaping by the exhaust without doing any work. It is the eccentric which wobbles excitedly around in the stationary casing, which performs the duty of a piston; and due to the effect of balance weights in the two fly wheels, its movement is uniform and

free from vibration. The steam type of engine has been improved somewhat since last year, though not radically. As for the internal combustion type, which is shown for the first time, it is admittedly only in an experimental state so far. It employs two rotors in two separate casings, one to compress the gas and the other to fire and expand it. In this way, its operation suggests that of the two-cycle reciprocating engine with external compression cylinder.

Another novel form of engine is shown in the Teel, which is of the two-cycle variety employing the differential piston construction which, by eliminating crank case compression, permits of high initial compression and so is thought to make for increased efficiency. It is shown in marine form, as a matter of fact, but its adaptation to automobile propulsion has been studied out by the builders. One other engine exhibit is that of the Lunt-Moss Co., wherein two styles of engine connected to electric generators are the means of softening the basement gloom in the immediate vicinity. The pertinence of the display is not obvious until it is learned that accumulators and battery charging outfits as well as isolated lighting plants are among the enterprises undertaken by the exhibitors.

Radical departures from precedent in spring construction by no means are unexpected, since the most familiar patterns of automobile suspension are admitted to be unsatisfactory in many respects. The appearance of the Eastman system, however, is sufficiently extraordinary to cause the visitor to pause. Its distinguishing mark is a pair of involute spring coils extending outwardly from the frame at either end of the car. The centers of the coils serve as the frame suspension points, the side members being extended longitudinally to provide anchorage for them, while the tangential outer ends of the coils are carried inwardly at an incline to the axles. In addition, dou-

abundance of such contrivances already before the public differs from any of them. The felloe band and rim are plain, save for corresponding beveled surfaces, which engage when the two are brought together and form a tight joint. Locking against creep is provided by a single key opposite the valve, which engages a depression in the felloe. The rim is secured in position by means of an expansible locking ring, the outer edge of which is provided with 12 tooth-like projections which engage with corresponding depressions formed in the band. As the teeth are shaped with wedging surfaces on two of their four sides, the expansion of the ring, which is accomplished

well as annunciators and other electrical devices. The chief pride and joy of the exhibitors, however, is the "Chantecler" dome light, which has a genuine barnyard king etched into the glass, and which is displayed in proof of Boston's close touch with current events. The Culver-Stearns electric attachments are intended for the motorist who is anxious to convert his gas and oil lamps to electric service. Included among them is a new form of headlight adapter, which takes the form of a parabolic reflector of such size that it will slip inside the ordinary searchlight, and with its tungsten bulb, clamp to the gas burner. It is claimed for this device, that while it gives more

EXHIBIT OF THE UNITED MANUFACTURERS, INC., IN EXHIBITION HALL

ble radius rods, with their ends spaced apart on the axle to prevent cross weaving of the frame, are carried out to the spring anchorage, but are attached at a point several inches below the center of the involute, thus affording a differential radial movement in the linkage when the axles oscillate.

The intention of the inventor has been to retard and reduce the movement of the body, by providing widely separated supports outside the wheel base, differential movement in the linkage tending to cause the springs to deflect horizontally to some extent as well as to unwind under the effect of upward axle movement; and to provide a system which is subject to adjustment for load. The latter effect is accomplished by winding or unwinding the springs through small arcs by means of adjusting screws and a crank. The system is shown mounted on a car purely for demonstration purposes.

Along with other new things comes the Jordan demountable rim, which, despite the

by applying a wrench to the toggle motion, serves to draw the rim over into place. It is there secured by the locking of the toggle. One particular advantage of the system is that it leaves the outer face of the wheel perfectly free from any indication of the demountable feature.

Nearby, the Lyon non-skid device, which is especially constructed for commercial vehicle service, is shown. Unlike the ordinary chain type of non-skid, it is supposed not to injure the tires in any way. Four steel straps, each of which is bent in such a way as to cross the tire tread twice, are coupled together so that a certain amount of springing effect is secured in the straps themselves, thus affording a flexible grip.

Perhaps a number of the basement accessory exhibits could not be seen at all, were it not for the good offices of the inventors of a number of automobile lighting contrivances of one sort and another. Holt & Beebe, for example, display a number of electric lighting fixtures in various forms, as

light than the gas burner, it can be driven past the most vigilant policeman without his objecting to the glare, merely because it is electric instead of gas. For such as adhere to gas alone, there are several automatic lighting devices, among them, the "Flash" and the Hart.

Though they are scattered, the basement affords seclusion to quite a number of useful as well as interesting exhibits, among them being those of a number of metal and machinery houses, which are particularly instructive to the lay visitor. But the bulk of the small wares display is located above ground in the galleries surrounding the two main halls, and in the corridors on the second floor. It is there that the constant attendants at all the shows are massed; the tire people showing such well-known brands as the Hartford, Diamond, Morgan & Wright, G & J, Continental and Firestone; the United Manufacturers aggregation, in a corner by itself; the usual variety of ignition paraphernalia, including the familiar

Bosch, Eisemann, Remy and Splitdorf magnetos; Pittsfield, Heinze and Atwater-Kent coils and timers; and the ever-present warning signals, such as the Jericho, Gabriel, Klaxon and Monoplex horns.

The Reliance speedometer is a new member of a peculiarly interesting series, but is modelled along lines which already are more or less familiar. The Cleveland, another relatively new instrument, is shown for the first time in a form especially designed for commercial vehicle service. The local Standard, and Casgrain instruments, as well as the Hoffecker, Stewart and Warner, of course, are given ample demonstration.

In the way of parts and materials shown upstairs, the assortment is representative, including such wares as Whitney, Brampton and Baldwin chains, though it is by no means as large as in former years. Perhaps no display is more complete than that of the lubricant producers, which includes among others the Haveline, Harris, Monogram, Invader and Vacuum oils. But certainly no element of the accessory section is more prominent and bewildering than the array set forth by the numerous manufacturers' agents, jobbers and retailers. For example, there is W. J. Connell with Elite jacks, E. & J. lamps and W. & S. magnetos and carburetters; J. D. Coward, with "Best" traction chains and Ajax wind shields; W. S. Daniels, who handles the Kokomo ignition appliances, Globe tool and battery boxes and Kingston carburetters, and Harry Eisner & Co., who displays Fry spark plugs, and Yankee whistles and mufflers. Post & Lester show the Roy lamps, Volier horns and Luna clocks among other things; T. F. Russell & Co. have Sherwood sight-feed multiple oilers, Field radiator and boiler compound, and a variety of other wares, while the Percy Ford Co. has among other things the Kennedy carburetter, Rohrbacher pumps and Eagle whistles—the last named being a new form of exhaust signal for attachment to the muffler tail pipe, which is of the self-cleaning pattern and hence is unaffected by mud and dust.

Among other specialties not shown before this year are the Caron road director, a continuous map index; the Auto-Lock, which is intended to prevent the theft of cars; Union folding wind shields, which are equipped with a new form of folding joint construction; the Oxy-Acetylene Apparatus Co.'s autogenous welding outfits, which are intended especially for garage repair work; and the Hercules and Craig concrete garage systems, the latter of which is "portable"—at least it is so in the sense that it can be disassembled when moving day comes.
